INDEX

TO THE

DESCRIPTIONS AND ILLUSTRATIONS.

Invention or Discovery.	Name of Patentee.	No.
A.		
Accoutrements, Mode of slinging.....	W. D. Mann.....	40, 849
Adding Machines	G. B. Fowler	39, 222
Adding Machines.....	M. C. Jeffers.....	40, 105
Addresses on newspapers, &c., Printing.....	J. A. Campbell.....	37, 432
Addresses on newspapers, &c., Printing.....	D. Fuller.....	39, 913
Agitator, Curd.....	J. H. Maydole.....	40, 764
Air, Heating by exhaust steam.....	A. C. Fletcher.....	38, 637
Air Condensing Apparatus for forcing liquids..	H. Strater, jr.....	38, 250
Alarm, Burglar.....	C. H. Stone and C. W. Livingston..	38, 136
Alarm, Burglars'.....	M. A. Genung.....	40, 469
Alarms, Fire, Electro-magnetic.....	W. Whiting.....	38, 074
Alarms, Temperature.....	R. Boyle.....	39, 794
Albums, Photographic.....	J. D. Mets.....	39, 300
Albums, Photographic.....	J. D. Mets.....	40, 702
Albums, Stereoscope and photograph.....	J. Q. A. Fresize.....	40, 654
Ale, beer, and porter, Extract of malt, &c., for making.	T. Hawks.....	37, 578
Algæ, Marine, to obtain a material for veneer- ing, inlaying, &c., Treating.	T. G. Ghislin.....	40, 619
Alkalies, Caustic, Putting up.....	E. A. Thomas.....	39, 080
Alkalies, Waste, Recovering.....	G. Howland.....	39, 653
Alkaline carbonates, Manufacture of.....	L. Chandor.....	39, 213
Alkaline silicates, Manufacture of.....	T. Elkinton.....	39, 135
Alloy of copper, zinc, and aluminum.....	J. Saur.....	40, 388
Alloys of aluminum.....	M. G. Farmer.....	38, 301
Aluminum, Alloys of.....	M. G. Farmer.....	38, 301
Amalgam and mercury from ore pulp, Collect- ing.	Z. Wheeler.....	39, 251
Amalgamating precious metals.....	E. Coleman.....	39, 550
Amalgamator and gold-washer.....	M. Battel.....	37, 268
Amalgamator.....	T. Hansbrow.....	40, 406
Amalgamators.....	A. F. W. Partz.....	39, 240
Amalgamatory Machine.....	E. Heath.....	37, 688
Ambulance.....	C. Britain.....	39, 460
Ambulances.....	M. Pinner.....	37, 518
Ambulances.....	A. W. Süss.....	39, 595
Anchor, Ship's, Cat-block for freeing a.....	G. W. Duncan.....	38, 356
Aniline blue, Preparation of.....	P. Monnet.....	37, 938
Aniline colors, Dyeing wool, silk, &c., with..	R. H. Gratrix.....	38, 306
Aniline colors, Mordant for fixing.....	A. Schultz.....	37, 426
Aniline compounds, Dyeing and printing a black color of fabrics with.	J. Lightfoot.....	38, 589
Animals from stalls, Releasing.....	W. Koenne.....	40, 416
Animals, Tethering.....	M. Johnson.....	40, 755
Animals' intestines, Cleaning.....	C. F. Dortenbach.....	38, 888
Annunciator.....	A. Rankin.....	37, 706
Antiseptic and hemostatic agents, Preparation to serve as.	P. A. F. Roboeuf.....	38, 940

Invention or Discovery.	Name of Patentee.	No.
Anti-typhus remedy	J. P. Fertie	39, 861
Anvils, Centring	J. Adt	39, 193
Apples, Dried, and other fruit, Stringing	S. T. Sanford	37, 708
Apples, grapes, &c., Grinding and pressing	C. B. Hutchinson	37, 579
Apple Paring Machine	J. F. and E. P. Monroe	37, 516
Architecture, Naval	J. Bowdlear	40, 321
Armor, Defensive, for marine and other batteries.	J. B. Eads	39, 218
Armor, Defensive, for ships and other batteries.	R. H. Jewett	37, 695
Armor for ships and other batteries, Defensive.	G. B. Manly	37, 402
Armor for ships and other batteries, Defensive.	R. Montgomery	37, 633
Armor for ships and other batteries, Defensive.	C. W. S. Heaton	38, 206
Armor plates, Defensive	M. Wappich	37, 836
Armor plates, Defensive, Means of affixing	E. Bradly	37, 807
Armor plates for land and marine batteries	F. P. Dimfel	39, 384
Armor plates, Ships', Press for bending	E. Saner	37, 982
Armor plates for ships and other batteries	J. T. Babbitt	37, 380
Arms, Artificial	M. Lincoln	39, 487
Arms, Artificial	E. Cotty	40, 397
Artist's easel	G. W. King	40, 171
Artisan's stage	W. B. Wait	39, 849
Augers, Hollow	R. Gaylord	39, 284
Augers, Hollow	G. N. Stearns	39, 841
Auger stock	S. C. Norcross	39, 669
Awl, holder, and extractor, Pegging	H. Huston	39, 815
Axles	H. G. Wesbling	37, 479
Axles, Car	C. D. Tisdale	39, 533
Axles, Car, and bearings, Mode of oiling	B. D. Stevens	39, 017
Axles, Car, Railroad	S. H. Dubois	37, 280
Axles, Carriage, Casting-boxes for	S. Williamson	39, 189
Axles, Lubricating	J. F. Hinman	40, 692
Axles, Wagon, &c., Composition for lubricating.	J. P. Gay	37, 746
Axle boxes, Dressing	W. Hamilton	38, 385
Axle boxes, Fastening covers to	J. O. Chute and P. Kimmey	38, 032
Axle boxes, Lubricating	C. Mezeix	39, 059
Axle boxes for vehicles	S. F. Green	40, 100
Axle skeins	H. F. Phillips	39, 617
Axles and journals, Lubricating	J. B. G. M. F. Piret	38, 760
Axes or picks	A. Moore	37, 970
B.		
Baby Tender	A. Wheeler	39, 766
Back-rest, Invalid	W. F. Brown	39, 462
Bag, Nose, Automatic	G. A. Hankinson	37, 914
Bag, Paper, Machine	J. J. Greenough	37, 573
Bag holder and elevator, Combined	G. H. Smith	38, 183
Bagasse for fuel, Preparing	J. M. Frink	38, 667
Balances	S. Harris	39, 145
Balances	H. W. Catlin	40, 906
Bales, &c., Mark holder for	H. W. Goodrich and E. A. Locke	38, 365
Bales of merchandise, Fastening	T. W. Reilly	40, 983
Balloons	T. L. Shaw	37, 667
Balloons	J. H. Connell	40, 608
Balloons, Discharging explosive shells from	C. Perley	37, 771
Balls, Springs, &c., Manufacture of	A. R. Davis	38, 813
Banding or belting, Machine	T. J. Mayall	49, 699
Bank Notes	J. M. Batchelder	37, 561
Bank Notes, &c., Device to prevent counterfeiting.	M. C. Lea	38, 231
Bank Notes, &c., Preventing the counterfeiting of.	I. Rehn	38, 335
Bark, Pressing	R. Healy	38, 861
Bark, Roping	B. F. Taber	37, 530

Invention or Discovery.	Name of Patentee.	No.
Bark, Roping.....	J. Cowie.....	39,888
Barley, &c., Hulling.....	J. J. Johnson and J. E. Weaver..	39,051
Barrels, Bungs of, Attaching pumps to.....	F. A. Pratt.....	40,082
Barrels, Bung socket and plugs for.....	S. J. Geoghegan and W. Ulmer...	37,747
Barrels, Making.....	P. Werum.....	39,694
Barrels, Oil.....	R. N. Allen.....	37,427
Barrels, &c., Oil, Compositions for lining.....	F. Becker.....	37,848
Barrels of oil, &c., Instrument for ascertaining the amount of water, &c., in.	G. Tagliabue.....	38,427
Barrels and casks for oil.....	A. Thompson.....	37,477
Barrel-crozing and hoop-driving machine.....	E. Holmes.....	37,719
Barrel-dressing machine.....	L. Wirthlin.....	39,696
Barrel heads, Tools for cutting and bevelling..	W. Watkins.....	38,520
Barrel heads and shingles, &c., Sawing.....	J. B. Dougherty.....	37,885
Basket, Fruit.....	O. Stoddard.....	40,436
Basket, Metallic.....	A. Schenck.....	39,426
Baths, Electric.....	M. W. House.....	38,389
Batteries, Armor plates for ships' and other...	B. T. Babbitt.....	37,380
Batteries, Defensive armor for ships' and other.	G. B. Manly.....	37,402
Batteries, Galvanic.....	E. A. Hill.....	39,571
Batteries, Galvanic.....	E. J. Fraser.....	40,537
Batteries, Galvanic, Carbon plates for.....	C. T. Chester.....	38,146
Batteries, Galvanic, Liquids for.....	D. H. Fitch, jr.....	38,894
Batteries, Magazine field.....	J. O. Whitcomb.....	38,350
Batteries, Marine and land, Armor plates for..	F. P. Dimfel.....	39,385
Batteries, Submarine.....	B. F. Smith, jr.....	37,942
Batteries, Travelling.....	C. Perley.....	37,766
Batteries for defence against projectiles, Con- struction of ships-of-war and other.	J. S. Gibbons.....	37,620
Batteries of war ships and other floating struc- tures.	C. W. S. Heaton.....	38,824
Battery, Revolving, for war vessels.....	F. A. DeMey.....	38,814
Battery, Submarine.....	N. W. Northrup.....	39,947
Battery Rams, Marine.....	J. F. H. King.....	37,817
Bayonet Scabbards, Cutting out.....	H. D. Smith.....	39,074
Bed, Spring.....	W. P. Miller.....	38,834
Beds for invalids.....	J. N. Morrison.....	40,056
Bed Bottom.....	J. Blyth.....	38,551
Bed Bottom.....	G. Frey.....	40,831
Bed Bottom, Spring.....	G. Schott.....	40,645
Bedsteads.....	D. U. Pratt.....	37,589
Bedsteads.....	D. Manuel.....	38,202
Bedsteads, Bureau.....	L. Derome.....	38,035
Bedsteads, Extension.....	A. Iske.....	40,564
Bedsteads, Folding.....	J. Housiaux.....	38,827
Bedsteads, Hospital.....	J. Lebo.....	38,700
Bedsteads, Invalids'.....	M. Johnson.....	40,413
Bedsteads, Invalid.....	W. Swift.....	40,716
Bedsteads, Sofa.....	F. C. Payne.....	38,978
Bedsteads, Sofa.....	T. J. Magee.....	39,863
Bedsteads, Sofa.....	T. J. Magee.....	40,848
Bedstead and table combined.....	O. Lafreniere.....	39,933
Bedstead Fastener.....	D. Babcock.....	37,560
Beehives.....	J. B. Strickler.....	37,310
Beehives.....	J. W. Smith.....	37,363
Beehives.....	W. W. Walker.....	37,414
Beehives.....	H. A. Hannum.....	37,576
Beehives.....	J. H. Graves.....	37,622
Beehives.....	J. Donnel.....	37,741
Beehives.....	R. P. Kidder.....	37,915
Beehives.....	S. M. Clanathan.....	38,012
Beehives.....	L. Parker.....	38,328
Beehives.....	J. H. Welty.....	38,348
Beehives.....	W. Warren.....	38,431
Beehives.....	R. G. Emerson.....	38,475
Beehives.....	W. M. Dickinson.....	38,660

Invention or Discovery.	Name of Patentee.	No.
Beehives.....	A. T. Wright	38, 925
Beehives.....	J. A. Gruver.....	39, 142
Beehives.....	W. A. Flanders.....	39, 221
Beehives.....	G. W. Smith, N. B. Vasburg, A. J. Kramer, and W. L. Winter.	39, 451
Beehives.....	J. H. Andrus.....	39, 622
Beehives.....	W. M. Lee.....	39, 660
Beehives.....	W. Green.....	39, 729
Beehives.....	A. Hogg.....	40, 038
Beehives.....	L. Brown.....	40, 323
Beehives.....	T. F. Bingham.....	40, 600
Beehives.....	H. A. King and J. Loughmaster..	40, 725
Beer, ale, and porter, Extract of malt, &c., for making.	T. Hawks.....	37, 578
Beer, &c., Cooling mash of.....	A. Smith.....	41, 025
Beer, Manufacture of, from malt and Indian meal.	J. Singer.....	39, 685
Beer and other liquids, Cooling.....	H. Steubing.....	40, 200
Bench, Shoemaker's.....	J. Tramblic.....	39, 763
Bending Machine, Felloe.....	J. Crompton.....	39, 887
Bell.....	J. S. Tibbets.....	39, 433
Bell, Call.....	N. L. Bradley.....	39, 697
Bell, Door.....	M. A. Genung.....	37, 863
Bell, Door.....	A. F. Cone.....	39, 796
Bells for horses, Alarm chime.....	C. Kirchhof.....	40, 108
Bell Shippers.....	T. P. Rodgers.....	39, 956
Bell Tightener, &c.....	J. A. and H. A. House.....	39, 015
Bellows.....	R. Boeklin and L. Planer.....	38, 880
Belts, Shoes, &c., Clasp for.....	E. S. Winchester.....	38, 009
Belts or Chains, Driving.....	W. Clissold.....	40, 910
Belt Fastener.....	C. Liebrich and L. Uitting.....	37, 353
Belting, Conveyor.....	J. Campbell.....	39, 716
Belting or banding, Machine.....	T. J. Mayall.....	40, 699
Bevels, Sawing, Machine for.....	H. E. Hughes.....	37, 816
Biers.....	D. Fitzgerald.....	38, 575
Bill and currency holder.....	G. B. Isham.....	39, 148
Bits, Bridle.....	J. H. J. O'Neill.....	39, 165
Bits, Bridle.....	C. E. Stockder.....	39, 843
Bits, Curb.....	T. S. Smith.....	40, 312
Bits, Drill.....	S. A. Morse.....	38, 119
Bit or boring tool.....	B. Sanderson.....	38, 633
Bits to braces, Attaching.....	O. Peck.....	39, 419
Bits to braces, Attaching.....	O. Peck.....	40, 275
Bits for horses, Automatical.....	H. T. Romertze.....	38, 541
Bits in their sockets, Holding.....	C. F. Hunter.....	40, 412
Bit Stock.....	S. U. King.....	39, 151
Blackboard and map case.....	W. C. Herider.....	40, 035
Blackboards, slate surfaces, &c., Composition for.	I. N. Peirce.....	37, 639
Blacking Apparatus, Boot and Shoe.....	I. Binckhard.....	37, 487
Bleaching, Dyeing, &c., Machine for.....	J. Young.....	39, 609
Blind, Window, Fastening.....	D. Mills.....	37, 300
Blinds for windows, &c.....	H. Hoffman.....	40, 795
Blinds, Venetian, Hanging.....	H. W. Safford.....	39, 069
Blind Fastenings, &c.....	W. Toepfer and H. Rugee.....	37, 597
Blind Slats, Fastening for.....	W. F. Redding.....	38, 913
Blind Stiles, Boring and mortising.....	E. R. Longhead.....	38, 590
Blowers.....	E. Suckow and E. Habel.....	37, 325
Blowers.....	B. Hotchkiss.....	40, 482
Blowers to furnaces of locomotives, Applica- tion of.	F. B. Blanchard.....	40, 014
Board Measures.....	A. D. Hoffman.....	37, 755
Boat, Canal, Attachment of the towlines of.....	C. W. Gage.....	38, 224
Boats, Canal, Unloading.....	T. Sharp.....	39, 683
Boat, Collapsible.....	C. F. Lightner.....	39, 661
Boats, Gun, Construction of.....	L. M. Van Sickle.....	38, 344

Invention or Discovery.	Name of Patentee.	No.
Boats, Gun, Drilling bolt-holes in turrets of...	T. F. Rowland.....	38,605
Boats, Metallic, Construction of.....	L. Raymond.....	38,984
Boat, Pontoon.....	E. Harrison.....	40,539
Boat, Pontoon.....	R. Pallett.....	40,706
Boat, Detaching.....	W. W. Andrews.....	37,799
Bobbins.....	C. F. Shaw.....	40,952
Bobbins or spools.....	B. Saunders.....	39,681
Bobbin Winders.....	D. F. Mellen.....	39,997
Bodies, Dead, Receptacles for.....	T. Holmes.....	39,291
Boilers.....	J. M. Dick.....	38,018
Boilers.....	C. Britain.....	40,157
Boilers.....	T. S. Lambert.....	40,172
Boilers, Brewers', Heating.....	D. S. Blair.....	40,990
Boilers, Coffee.....	N. Waterman.....	39,851
Boilers, Copper.....	A. C. Brownell.....	39,881
Boilers for culinary purposes.....	P. L. Suine.....	39,077
Boilers, Farmers'.....	M. Ellis.....	38,299
Boilers, Locomotive.....	G. F. Johnson.....	38,584
Boilers, Locomotive.....	B. Crawford.....	39,123
Boilers, Locomotive.....	J. Briggs.....	40,389
Boilers for making paper pulp.....	M. L. Keen.....	38,901
Boilers, Steam.....	G. B. McDonald.....	37,355
Boilers, Steam.....	S. Stimmetz.....	37,795
Boilers, Steam.....	W. W. Crane.....	38,812
Boilers, Steam.....	A. Hitchcock.....	39,047
Boilers, Steam.....	R. S. Harris.....	39,289
Boilers, Steam.....	T. T. Prosser.....	39,530
Boilers, Steam.....	B. Densmore.....	39,895
Boilers, Steam.....	A. F. Barton.....	40,016
Boilers, Steam.....	J. Perkins and W. Bennett.....	40,118
Boilers, Steam.....	J. Briggs.....	40,391
Boilers, Steam.....	S. Hoyt.....	40,563
Boilers, Steam.....	R. S. Harris.....	40,929
Boilers, Steam, Connecting section of.....	C. Whittier.....	38,855
Boilers, Steam, Covering for.....	M. A. Johnson.....	37,967
Boilers, Steam, Feed-water heaters for.....	R. C. Bristol.....	37,731
Boilers, Steam, Feed-water heaters for.....	W. W. Martin.....	38,870
Boilers, Steam, Method of regulating the supply of water in.	G. B. Wright.....	40,206
Boilers, Steam, Setting.....	H. France and C. L. Knowles.....	38,956
Boilers, Steam, Setting tubular.....	H. France and C. L. Knowles.....	38,957
Boilers, Steam, Water gauges for.....	E. W. Vanduzen.....	37,534
Boilers, Stove, Forming and double seaming..	H. B. Whitlock and C. E. Toan.....	38,616
Boilers with water, Self-acting apparatus for supplying.	V. F. Clenet.....	39,379
Boiler Feeders.....	T. W. Burger.....	37,673
Boiler Feeders, Self-acting.....	F. D. Boyle.....	39,378
Boiler Feed Regulator.....	W. Webster.....	40,523
Boiler Tubes, Repairing.....	E. Clark.....	39,717
Boiler Tubes, Tool for fastening.....	A. Van Guysling.....	40,967
Bolts.....	W. J. Clark.....	40,327
Bolts, Door.....	H. S. Smith.....	37,646
Bolts, Hoop, Pointing and checking.....	A. A. Wilder.....	38,085
Bolts, Making.....	W. E. Ward.....	38,518
Bolts, nuts, &c., Manufacturing.....	J. Marsden.....	38,116
Bolts, rivets, and nails, Attaching the heads of	G. B. Brayton.....	38,652
Bolts, Trimming or cutting.....	H. Beckwith.....	37,943
Bolt and lock, Improvement in.....	E. O. Frink and C. E. McDonald.....	39,223
Bolts and rivets, Clipping.....	Z. B. Cotant.....	38,564
Bolts and spikes, Drawing.....	J. C. Chapman.....	37,332
Bomb Lance.....	O. Allen.....	40,387
Bone Black, Furnaces for reburning.....	G. Thulemeyer.....	40,371
Bone Black, Revivifying.....	G. Finken.....	39,637
Bone Black, Revivifying.....	J. Forrest.....	39,638
Bonnets and hats, Manufacture of palm-leaf..	D. C. Perrin.....	37,409
Books, Account, Registers for.....	A. F. Jones.....	40,106

Invention or Discovery.	Name of Patentee.	No.
Books, Pocket.....	A. L. Adams.....	40, 223
Books, Record, Case for.....	W. H. Somers.....	39, 503
Bookcase, Portable.....	E. Haskell.....	37, 752
Booms to masts, Means for attaching.....	M. McClain.....	40, 273
Boots.....	J. H. Agnew.....	38, 272
Boots, Gaiter.....	J. C. Breed and Chas. K. Bradford.....	39, 544
Boots, Mode of cutting.....	S. S. Drew.....	40, 308
Boots, Mode of lacing.....	R. Newton.....	39, 163
Boots, Patterns for cutting.....	E. Shopbell.....	37, 526
Boots, Skating.....	G. T. Barker.....	38, 938
Boots and Gaiters.....	J. P. Herron.....	39, 614
Boots and Shoes.....	P. Shaw.....	38, 766
Boots and Shoes.....	G. W. Ludlow.....	39, 156
Boots and Shoes.....	D. E. Hayward.....	40, 408
Boots and Shoes, Attaching rubber soles to.....	D. E. Hayward.....	40, 802
Boots and Shoes, Cutting soles of.....	J. W. Maloy.....	38, 496
Boots and Shoes, Heel stiffener or counter for.....	D. E. Hayward.....	40, 409
Boots and Shoes, Improvement in.....	D. N. B. Coffin, jr.....	38, 373
Boots and Shoes, India-rubber soles for.....	T. C. Weeks.....	38, 615
Boots and Shoes, Lasting the uppers of.....	M. R. Ethridge.....	37, 907
Boots and Shoes, Manufacture of.....	E. Alexander.....	39, 370
Boots and Shoes, Manufacture of.....	H. Port.....	39, 421
Boots and Shoes, Nailing heels to.....	G. W. Ellis.....	41, 038
Boots and Shoes, Pegging.....	J. H. Brown.....	40, 306
Boots and Shoes, Pegging.....	W. Miller.....	40, 351
Boots and Shoes, Rolling seams of.....	J. C. White.....	39, 515
Boots and Shoes, Stiffening for heels of.....	E. M. Stevens.....	39, 594
Boots and Shoes for use with machine for screwing on soles and heels, Apparatus for holding and supporting.....	E. Lemercier.....	37, 886
Boots and Shoes, Waterproof.....	E. L. Simpson.....	39, 865
Boot and Shoe Heel.....	M. C. Easterly.....	40, 162
Boot and Shoe Soles.....	C. Goodyear, jr.....	37, 287
Boot Crimping Device.....	T. Madgett.....	40, 634
Boot Forms.....	L. N. Leland.....	39, 293
Boot Heels, Punching the lifts of.....	G. W. Ellis.....	41, 037
Boot Trees.....	A. P. Richardson.....	38, 986
Boot Trees.....	W. C. Clark.....	39, 034
Boring Machines.....	J. Meyer.....	38, 908
Boring Machines.....	G. S. Corwin.....	40, 459
Boring rock, Tool for.....	R. Leschot.....	39, 235
Bottle, Castor.....	C. P. Crossman.....	39, 889
Bottles, &c., Closing.....	N. Thompson.....	40, 293
Bottles, Device for stopping.....	A. Andre.....	38, 367
Bottles, &c., Device for stopping.....	N. Thompson.....	40, 292
Bottles, Machine for filling.....	W. M. Tate.....	40, 516
Bottles, Packing, Case for.....	R. Carpenter.....	39, 377
Bottles, &c., Packing for transportation.....	T. M. Perot.....	39, 950
Bottles, Stopping.....	A. Wiegand.....	40, 136
Bottles and Flasks.....	W. T. Fry.....	40, 338
Bottle Stopper.....	C. F. Baxter.....	39, 208
Box for case-hardening.....	J. Green.....	40, 477
Box, Dredging, with grater and cake cutter attached.....	G. D. Bayley.....	37, 716
Box, Metal.....	H. Howson.....	39, 994
Box, Vacuum, of paper-making machines.....	J. L. Seaverns.....	39, 500
Boxes, Ash, for stoves.....	C. J. Woolson.....	38, 256
Boxes, Letter, for post offices.....	C. H. Bradley.....	39, 879
Boxes, Making.....	S. L. Hill.....	40, 480
Boxes, Manufacturing of.....	J. Sperry.....	40, 507
Boxes, Metal.....	J. L. Kite.....	38, 585
Boxes, Mould, for casting propeller wheels.....	W. Leckler and J. K. Schupp.....	37, 295
Boxes, Nailing.....	G. Wicks.....	38, 924
Boxes and Pipe, Fitting.....	W. Thurber.....	40, 779
Box Machine.....	G. P. Roberts.....	37, 827
Brace.....	A. W. Streeter.....	40, 652

Invention or Discovery.	Name of Patentee.	No.
Brace, Ratchet	L. H. Olmsted	37, 971
Braces, Bits to, Attaching	O. Peck	39, 419
Bracket brace for stair rails	E. Betts	39, 875
Brackets for lamps or gas-lights	C. Monson	39, 945
Braid, Manufacture of	A. H. Boyd	37, 541
Braid, Tagged, for shoe strings	J. Hill	38, 164
Braiding Machines	H. Fletcher	39, 137
Braiding Machines	J. Fletcher	39, 138
Braiding Machines	J. W. Wood	41, 045
Brakes, Car	D. S. Cross	37, 568
Brakes, Car	A. I. Ambler	40, 005
Brakes, Car	W. S. Morrow	41, 042
Brakes, Car, Railroad	J. Hough	38, 166
Brakes, Car, Railroad	D. Myers	39, 306
Brakes, Car, Railroad	T. J. Whitney	39, 440
Brakes, Car, Railroad	I. N. Pyle	39, 495
Brakes, Car, Railroad	A. I. Ambler	40, 007
Brakes, Car, Railroad	J. Davis	40, 332
Brakes, Car, for railroads	W. S. Martin	41, 013
Brakes, Car, Shoes for	J. Bing	40, 156
Brakes, Carriage	M. K. Lewis	38, 752
Brakes to cotton lappers	R. Kitson	40, 048
Brakes, Friction	R. Kitson	38, 749
Brakes, Safety, for horse-powers	D. M. Reynolds	41, 020
Brakes, Wagon	J. Row	38, 697
Brakes, Wagon, Operating	J. H. Lee	40, 759
Brake and Swingler, Flax	S. Cowan	40, 091
Brands, Marking	G. H. Strong	39, 261
Bran Duster	W. W. Huntley and A. Babcock	38, 484
Bran Duster	M. Smith	39, 021
Brass, Polishing, Composition for	W. H. Tripler	39, 848
Bread, Making	W. O. Drew	38, 037
Bread, Making	J. Perry	40, 707
Bread-cutting Machine	R. P. March	39, 298
Breast straps, Roller attachment for	F. Jones	40, 045
Brewing with maize	L. Haecker	40, 836
Brick, Moulding	O. W. Seely	38, 607
Bricks and Tiles, Heating untempered clay for	I. Gregg	38, 580
Brick Machines	J. A. Lafler	37, 348
Brick Machines	D. W. Gould	38, 041
Brick Machines	I. Gregg and H. Moser	38, 629
Brick Machines	S. Strong	38, 716
Brick Machines	J. N. Newell	39, 061
Brick Machines	C. Chambers, jr	40, 221
Bridges	I. Rogers	37, 642
Bridges	J. C. Briggs	38, 653
Bridges, Iron	S. S. Post	38, 910
Bridges, Truss	J. Boles, 2d	38, 552
Bridges, Truss	J. L. Jones	39, 447
Bridges, Turn	J. Angersoll	38, 966
Bridles	A. H. Langholz	37, 583
Bristles, Assorting	N. H. Spafford	37, 927
Bronzing Machine	J. F. Tapley	41, 029
Broom	W. N. Bates	39, 874
Broom, Constructing	S. M. Sherman	38, 341
Brush	S. Morris	39, 417
Brushes	J. L. Whiting	39, 439
Brushes, Hat	C. F. Phelps	38, 632
Brushes, Hat, Holders for	J. M. Osgood	38, 240
Brushes, Marking	E. P. Clark	40, 089
Brushes, Shoe	R. M. Whipple	37, 315
Brushes, Warp	S. Taylor	38, 516
Brushes, Whitewash	J. Loughbridge	38, 051
Buckets, Elevator	J. S. Brooks	40, 671
Buckets and Tubs, Tools for finishing	J. W. Bartlett and A. Morris	39, 334
Buckles	L. Fogg	38, 793

Invention or Discovery.	Name of Patentee.	No.
Buckles.....	O. L. Hopson and H. P. Brooks..	38,482
Buckles.....	F. Douglas.....	39,217
Buckles, Trace and harness.....	H. Hise.....	39,651
Buckles, Tug.....	N. H. Howard.....	39,734
Buckle for waist belt.....	W. U. Bohn.....	37,489
Buckle gag runner.....	J. M. Martin.....	40,636
Buggies, Construction of.....	J. H. Bye.....	40,817
Buhrs, Metallic.....	A. T. Boon.....	40,549
Buildings, Clamps for raising.....	N. Pickard.....	38,501
Buildings, Facing the walls of.....	T. S. Lambert.....	40,844
Building, blocks, cement, tiles, pipes, pavements, &c., Composition for forming.	I. Marsh, jr., and G. Marsh.....	38,833
Building pieces, Cast-iron.....	R. Wood.....	40,975
Bullet, Cartridge.....	W. H. Dibble.....	40,092
Bullets, Casting.....	J. P. Driver.....	37,389
Bullets, Minie, Patching.....	O. D. Lull.....	40,761
Bullets for fire-arms.....	A. W. Billings.....	40,153
Bumpers and Draw-head Springs for railroad cars.	J. C. Jackson.....	37,448
Bungs, Bushes for.....	W. Kenyon and A. Menzies.....	38,830
Bungs, Manufacture of.....	L. Gray.....	39,644
Bungs for coal-oil barrels, &c.....	J. S. Loomis and A. Thompson.....	37,722
Bungs and Corks, Cutting.....	J. Leavens.....	37,543
Bureau and Trunk, Combination of.....	A. V. Ryder.....	39,679
Burial cases.....	E. H. Burton.....	38,857
Burial cases.....	E. A. Burton.....	39,758
Burial cases, Metallic.....	A. C. Barstow.....	37,484
Burial cases, Metallic.....	M. H. Crane.....	38,443
Burners, Aerovapor.....	O. F. Morrill.....	40,353
Burners, Coal-oil.....	M. B. Dyott.....	37,281
Burners, Coal-oil.....	E. Trittin.....	38,070
Burners, Coal-oil.....	S. Frederick.....	38,223
Burners, Coal-oil, for lamps.....	J. T. Vankirk.....	37,930
Burners for coal-oil lamps.....	A. C. Wilhelm.....	39,856
Burners, Gas.....	G. C. Roundey.....	38,417
Burners, Gas.....	J. S. Fancher.....	39,725
Burners, Gas.....	F. Limkenheimer.....	39,820
Burners, Gas, Lamps, or for holding vessels or shades over the flame, Attaching to.	W. L. Fish.....	40,617
Burners, Hydro-carbon.....	M. L. Callender.....	38,031
Burners, Lamp.....	H. Wright.....	37,540
Burners, Lamp.....	J. Wolstenholme.....	37,599
Burners, Lamp.....	H. C. Hunt.....	37,600
Burners, Lamp.....	H. Brown.....	37,606
Burners, Lamp.....	J. O. Blythe.....	37,945
Burners, Lamp.....	O. J. Savage and G. P. Hawley.....	38,422
Burners, Lamp.....	A. A. Henderson.....	38,742
Burners, Lamp.....	P. J. Clark.....	38,926
Burners, Lamp.....	J. B. Gray.....	38,960
Burners, Lamp.....	M. B. Wright.....	38,999
Burners, Lamp.....	W. Painter.....	39,102
Burners, Lamp.....	J. J. Marcy.....	39,320
Burners, Lamp.....	J. S. Hull.....	39,399
Burners, Lamp.....	J. S. Hull.....	39,400
Burners, Lamp.....	J. McHenry.....	39,413
Burners, Lamp.....	J. Dodin.....	39,524
Burners, Lamp.....	C. H. Kupfer.....	40,050
Burners, Lamp.....	C. C. Warwick.....	40,439
Burners, Lamp for kerosene.....	T. Raymond.....	38,537
Burners, Lamp, Perforations in.....	W. H. Smith.....	37,845
Burners, Lamp and Lantern.....	C. W. T. Krausch.....	37,868
Burners, Wick tube for lamp.....	C. L. Daboll.....	38,567
Butter Worker.....	M. Sweet.....	37,664
Butter Worker.....	C. L. Gilpatrick.....	39,808
Butter Worker.....	J. B. Lyons.....	40,697
Buttons.....	P. E. Richardiere.....	37,774

Invention or Discovery.	Name of Patentee.	No.
Buttons.....	A. A. Feldtrappe and R. Dutfoy..	40,254
Buttons, Sleeve.....	W. H. Wilson.....	37,784
Button, Sleeve, and Shirt Studs.....	H. Simon.....	37,777
Buttons or Studs, Fastening for.....	L. M. Bronson.....	39,461
Button Key.....	H. St. John.....	40,714
C.		
Cables, Submarine.....	P. S. Devlian.....	39,896
Cage, Bird.....	C. L. Osburn.....	38,177
Calculators, Arithmetical.....	J. P. Miller.....	39,740
Calculators, Tax.....	C. D. Crane.....	38,374
Calipers.....	D. C. Talbot.....	37,531
Calipers.....	C. A. Fairfield.....	39,281
Camel, Marine.....	S. Woolston.....	38,527
Camera, Photographic.....	J. Stock.....	39,432
Camera Stand.....	J. A. Whipple.....	39,602
Camps, hospitals, &c., Composition for disinfecting and purifying.	J. L. Kidwell.....	38,748
Canes for weavers' reeds, Shaving.....	J. Church.....	39,523
Cane and seat.....	C. H. Daecomb.....	40,823
Cannons, Constructing.....	C. Perley.....	38,409
Cannons, Firing by electricity.....	G. W. Beardslee.....	39,543
Cannons, Pendulum sight for.....	R. Smith.....	40,288
Cannons, Planing the chambers of.....	A. Alexander.....	40,225
Cannons, Rifling, Machines for.....	A. Bonzano.....	37,898
Cannons and Fire-arms, Construction of.....	N. A. Patterson.....	40,498
Cans, Fruit, Closing.....	N. S. Gilbert.....	39,643
Cans, Fruit, Closing.....	W. Webster.....	39,853
Cans, Fruit, Covers for.....	T. Earle.....	40,996
Cans, Jars, &c., Caps for.....	J. K. Chase.....	38,810
Cans, Jars, &c., Preserve.....	T. Earle.....	40,556
Cans, &c., Lid or covers for.....	J. Bryant.....	40,552
Cans, Metal, Sheet.....	S. Hunt.....	37,400
Cans, Metal, Sheet, Soldering.....	H. Miller.....	39,616
Cans, Milk.....	H. Preston and J. Mahood.....	37,977
Cans, Oil.....	J. Mayher.....	39,157
Cans, Sheet metal.....	H. Miller.....	38,974
Cans, Sheet metal.....	H. Miller.....	40,661
Cans, Tin, Manufacturing of.....	J. E. Vansant.....	40,372
Can or flask.....	J. Dunton.....	37,843
Canteen.....	L. F. Bronnum.....	37,273
Canteen.....	J. M. Trowbridge.....	40,655
Caoutchouc, Apparatus for curing.....	W. R. Bagnall.....	38,369
Caoutchouc, &c., Cutting into strips and threads.	L. Hull.....	37,446
Caoutchouc Shirt Collars.....	J. A. Pease.....	38,122
Caoutchouc or India-rubber.....	L. Hull.....	37,866
Caps, Military.....	S. Massman.....	39,667
Caps, Oil, for machinery.....	T. W. Godwin.....	40,032
Cap Holder, Percussion.....	T. B. Lamb.....	40,487
Capstan, Rail for ship's.....	W. H. Willard.....	39,518
Capstan or windlass.....	I. G. Morgan.....	40,352
Carbonates, Alkaline, Manufacture of.....	L. Chandler.....	39,213
Card Board, Cutting.....	L. Knickerbocker.....	38,750
Carding Engines.....	W. K. Platt.....	39,776
Carding Engine.....	F. A. Calvert.....	40,018
Carding Machine.....	L. O'Brien.....	40,181
Carding Machine, Wool.....	J. Davis.....	39,381
Carpet Bag Frame.....	S. Lagowitz.....	39,152
Carpet Lining.....	S. M. Allen.....	37,728
Carriages, Attaching shafts or poles to.....	J. Northrup, Z. Loomis, and G. W. Clark.	37,636
Carriages, Body loop for.....	C. H. Guard.....	39,699
Carriages, Brake mechanism for.....	L. Wilbur.....	37,468
Carriages, &c., Calash or folding top for.....	I. Cogswell, jr.....	37,734

Invention or Discovery.	Name of Patentee.	No.
Carriages, Draught clip ties for.....	P. Blake.....	38,650
Carriages, Gun.....	M. Wappich.....	37,882
Carriages, Gun.....	J. B. Lyons.....	38,831
Carriages, Gun, Operating.....	R. H. Long.....	39,449
Carriages, Holdbacks for.....	R. Rolph.....	39,958
Carriages, Metal plate shoes for.....	J. Dubois.....	38,571
Carriages, Railway.....	N. F. Bryant.....	39,545
Carriages, Railway.....	N. F. Bryant.....	40,813
Carriages, Saw mill, Turning logs on.....	W. L. Oliver and A. J. Hancock..	38,756
Carriages, Thill couplings for.....	T. S. Lambert.....	40,245
Carriages, Wagons, &c., Constructing.....	J. Kirkham.....	40,758
Carriage Bodies, Hanging.....	E. Lane.....	38,751
Carriage Covers.....	J. J. Rankin.....	38,601
Carriage Holdback.....	R. Nutting.....	38,597
Carriage Poles, Adjustable.....	L. C. Miner.....	39,415
Carriers and elevator.....	H. E. Plumb.....	37,704
Cars, Constructing.....	S. J. Seely.....	38,507
Cars, Railroad, City.....	J. Ruth.....	38,181
Cars, Railroad, Devices attached to, for facilitating the passage of trains up steep gradients or inclining planes.	T. Agudio.....	38,800
Cars, Railroad, Iron.....	H. Merrill.....	38,082
Cars, Railroad, Moving.....	C. W. T. Krausch.....	37,818
Cars, Railroad Platform.....	H. Holcroft and C. S. Smith.....	38,743
Cars, Railroad, Signal bell and brake attachments for.	D. Harrigan.....	39,097
Cars, Railroad, Stopping and starting.....	J. Steger.....	39,999
Cars, Railroad, Ventilating.....	C. D. Gibson.....	39,140
Cars, Railroad, Ventilating.....	T. S. Lambert.....	40,843
Cars, Railway dumping.....	A. Welch.....	40,134
Cars, Railway, Safety guard for.....	T. Gillen.....	39,011
Cars, Rolling shoes for replacing.....	W. L. Gilroy.....	38,671
Cars, Stopping and starting.....	T. S. Bigelow.....	39,091
Cars for carrying petroleum, &c.....	J. Scott.....	37,361
Cars for carrying petroleum, &c.....	S. J. Seely.....	38,765
Cars for petroleum.....	J. Clark.....	40,458
Cars to railroad tracks of different grades, Applying.	C. D. Tisdale.....	37,889
Cars to trucks, Connecting.....	A. Bridges.....	38,726
Car and Truck Connexions.....	J. J. Sherman.....	38,182
Car Replacers for railroads.....	B. Harper.....	40,928
Car Seat Locks.....	R. B. More.....	39,303
Cartridges.....	C. K. Alsop.....	37,481
Cartridges.....	W. H. Horstmann and H. J. Behrens.	39,923
Cartridges.....	E. Maynard.....	40,111
Cartridges, Metal, for cannon.....	W. E. Moore.....	38,322
Cartridges, Metallic.....	W. Bakewell.....	39,109
Cartridges, Metallic.....	E. Maynard.....	39,823
Cartridges, Metallic.....	A. Hall.....	39,915
Cartridges, Metallic.....	E. Maynard.....	40,112
Cartridges, Metallic.....	T. J. Rodman and S. Crispin.....	40,988
Cartridges, Metallic, Primed.....	W. W. Marston.....	40,490
Cartridges, Metallic, Primed.....	S. Crispin.....	40,978
Cartridges, Metallic, Priming.....	C. Sharp.....	40,772
Cartridges, Metallic, Shot.....	E. K. Root.....	38,414
Cartridges, Shot.....	L. B. Bruen.....	37,491
Cartridge Box.....	A. A. Bennett.....	37,485
Cartridge Boxes.....	F. Bush.....	37,607
Cartridge Case for revolving fire-arms.....	J. H. Vickers.....	39,869
Case for record books.....	W. H. Somers.....	39,503
Casks.....	J. Connolly.....	39,274
Casks, drums, kegs, &c., Manufacture of.....	D. Cope.....	38,217
Casks, Liquor, Gauging rods for.....	D. C. Hyde.....	38,681
Casks and barrels for oil.....	A. Thompson.....	37,477

Invention or Discovery.	Name of Patentee.	No.
Casks, fancy articles, toys, &c., Composition for.	M. Schall	39, 070
Cat-Block for freeing a ship's anchor.....	G. W. Duncan	38, 356
Caustic Alkalies, Putting up.....	E. A. Thomas	39, 080
Cement, Asphaltic	A. Straub.....	40, 649
Cement for leather, &c., Water-proof	R. Hinchelwood and C. A. A. Dur- ing.	38, 480
Cement, stone, wood, &c., Indurating and preserving.	J. C. Combe.....	38, 287
Cement, tiles, pipes, pavements, building blocks, &c., Composition for forming.	I. Marsh, jr., and G. Marsh.....	38, 833
Cement and Metallic Pipes, Combination.....	H. Knight.....	38, 112
Cement Pipes, &c., Making	D. S. Ogden.....	38, 695
Chains, or Belts, Driving.....	W. Clissold	40, 910
Chains, &c., Ornamental.....	E. S. Richards.....	38, 842
Chains, Or, Hooks for.....	F. G. Johnson	38, 490
Chains, &c., Watch, Swivel hoop for.....	L. Bornemann	40, 790
Chain Hooks	G. H. Draper.....	38, 532
Chain Link	J. Packer	39, 239
Chair.....	D. E. Teal.....	38, 428
Chair.....	C. O. Limberg.....	40, 175
Chair, Arm, Folding.....	H. S. Golightly and C. S. Twichell.....	40, 210
Chair, Folding.....	J. A., W. T., and I. N. Dann.....	37, 277
Chair, Folding.....	J. D. Merriam	37, 324
Chair, Folding.....	H. S. Golightly and C. S. Twichell.....	37, 864
Chair, Folding.....	E. W. Vail.....	38, 132
Chair, Folding.....	A. D. Whitmore.....	40, 526
Chair, Folding.....	P. J. Hardy.....	41, 001
Chair, Folding and reclining	G. Hunzinger.....	39, 995
Chairs for invalids	G. A. Mansfield	39, 663
Chairs, Invalid, Travelling.....	C. L. Bander	40, 547
Chair, Nursery.....	A. B. Anderson, jr.....	37, 026
Chairs, Railroad.....	J. Armstrong.....	37, 668
Chairs, Railroad.....	B. F. Gossin.....	38, 159
Chairs, Railroad.....	E. St. John.....	38, 612
Chairs, Railroad.....	S. Brisack.....	38, 944
Chairs, Railroad.....	B. F. Gossin.....	40, 748
Chairs, Railroad, Combined splice piece and, Securing.	M. W. Knox.....	40, 567
Chairs and Cross-ties, Iron railway.....	L. G. Marshall.....	40, 541
Chair or Lounge, Folding.....	J. Sutton.....	40, 512
Chair or Stool, Camp.....	A. D. Whitmore.....	40, 002
Chair Backs, Dressing.....	S. L. Fitts.....	39, 220
Channelling Tool	J. B. Johnson	39, 366
Channelling Tool.....	A. Bottum.....	40, 814
Checks, Baggage	W. D. Richardson.....	40, 186
Checks, Railroad and baggage	F. H. Furniss and F. R. Myers.....	37, 441
Cheese Turning Apparatus.....	A. Mears.....	40, 214
Cheese Vats.....	H. A. Roe.....	37, 524
Chenille, Manufacturing.....	G. Comings and L. Mensing.....	37, 385
Chenille, Manufacturing.....	W. Canter	37, 415
Cherry Stoner	T. Van Kannel	38, 434
Cherry Stoner.....	H. Buckwalter.....	40, 604
Chests or Safes, Fire-proof.....	E. N. Horsford.....	39, 920
Chimney.....	R. M. Basset and G. Mallory	40, 730
Chimneys, Cleaning.....	C. D. Blinn.....	39, 792
Chimneys, Lamp.....	G. F. J. Colburn	38, 150
Chimneys, Lamp.....	W. L. Jenkes.....	38, 492
Chimneys, Lamp.....	H. Booth, jr.....	38, 881
Chimneys for lamps.....	H. W. Miller	39, 301
Chimneys, Lamp.....	L. J. Atwood	40, 228
Chimneys, Lamp.....	A. Albertson.....	40, 890
Chimneys, Lamp, Adjuster.....	J. R. Fogg	38, 628
Chimneys, Lamp, Elevating.....	J. G. Lettingwell.....	37, 917
Chimneys for lamps, Glass.....	C. L. Daboll	38, 657

Invention or Discovery.	Name of Patentee.	No.
Chimneys for lamps, Glass.....	G. F. J. Colburn.....	38, 947
Chimneys for lamps, Mica.....	B. J. C. Howe.....	37, 506
Chimneys, Lamps, Mica.....	W. P. Ware.....	37, 837
Chimneys and shades for lamps and other lights.	M. J. Wellman and J. J. Greenough.	40, 785
Chimney Caps.....	L. F. Betts.....	37, 270
Chimney Caps.....	J. Tomlinson.....	39, 846
Chimney Fastener.....	R. W. Hawkins.....	38, 388
Chimney Tops.....	G. Elbre.....	37, 683
Choke, Gas, for breech-loading fire-arms.....	J. C. Symmes.....	39, 844
Chrome Compound.....	A. K. Eaton.....	28, 297
Chuck, Self-cleaning.....	J. W. Bartlett.....	39, 769
Chuck, Universal.....	M. Alden.....	39, 457
Churns.....	J. B. Edgell, E. A. Alexander, and H. C. Kellogg.	37, 437
Churns.....	C. L. Bottum.....	37, 730
Churns.....	H. R. Ladd.....	38, 587
Churns.....	J. H. Weaver and D. L. Mefford.	38, 635
Churns.....	E. H. Philo.....	38, 865
Churns.....	S. F. Emerson.....	38, 891
Churns.....	H. Doolittle.....	38, 951
Churns.....	A. Walker.....	39, 023
Churns.....	L. S. Colburn.....	39, 035
Churns.....	J. A. Lloyd.....	39, 055
Churns.....	R. W. Whitney.....	39, 205
Churns.....	S. Gissinger.....	39, 225
Churns.....	J. Tingley.....	39, 507
Churns.....	E. Hinman.....	39, 529
Churns.....	A. H. Hart.....	39, 650
Churns.....	T. E. Griffiths.....	40, 404
Churns.....	G. L. Wetsil.....	40, 450
Churns.....	J. Houston.....	40, 623
Churns.....	S. F. Emerson.....	40, 997
Churns, Device for operating.....	O. W. Seely.....	38, 013
Churns, Operating.....	A. J. & C. Lamb.....	37, 511
Churns, Operating.....	G. C. Ferris.....	38, 158
Churns, Operating.....	O. Edson.....	38, 663
Churns, Operating.....	H. C. Addis.....	39, 107
Churns, Operating.....	H. Soggs.....	40, 775
Churns, Operating, Machinery for.....	J. J. Taylor.....	39, 532
Churns, Power.....	E. Hoag.....	40, 751
Churns and Washing Machine, Operating.....	J. T. Bever.....	37, 330
Churn Dasher.....	M. J. Palmer and H. R. Ingalls..	37, 357
Churn Dashers.....	A. C. Brown.....	38, 145
Churn Dashers.....	M. Jenks.....	39, 050
Churn Dashers.....	H. P. Westcott.....	39, 600
Churn Power.....	J. D. Parrot.....	39, 827
Cisterns, Instruments for indicating the depth of water in.	H. L. Brevoor.....	39, 114
Clamp for curtain fixtures, Self-holding.....	F. C. Payne.....	39, 949
Clamps, Floor.....	D. K. Peoples.....	40, 727
Clamps for raising buildings.....	N. Pickard.....	38, 501
Clasp for closing preserve jars.....	J. A. Cowles.....	38, 288
Clasp for harness tugs.....	L. D. Cowles.....	40, 911
Clasp for harness tugs.....	L. D. Cowles.....	40, 912
Clasp for paper shade holders.....	G. Wederkind.....	37, 990
Clocks.....	R. T. Andrews.....	38, 543
Clocks, Calendar.....	W. W. Carter.....	39, 883

Engines, Steam	J. Fish	40,615
Engines, Steam	H. Waterman	40,656
Engines, Steam, Cut-off valve gear for	J. F. Hamilton	39,228
Engines, Steam, Direct action	T. Thatcher	40,778
Engines, Steam, Valve chest for	T. S. Davis	39,125
Engines, Steam, Valve gear of	W. R. Greenheaf	37,342
Engines, Steam, Variable cut-off valve gear for	J. F. Hamilton	39,229
Engines, Trunk	T. Northey	37,302
Engines, Water	A. Coats and M. V. Osborn	38,531
Engine Turning Machines	A. Schwitler	39,755
Envelope, Letter	H. C. Bristol	37,490
Envelope, Letter	W. Murphy	38,755
Envelope Machine	J. M. D. Keating	39,053
Envelope Machine	G. H. Reay	39,702
Eraser and Stamp, Pencil	E. Faber	38,892
Escapements	W. N. Manning	38,594
Evaporating, Apparatus for	M. Pake	39,948
Evaporating apparatus, Fire arches	S. Berry	40,599
Evaporating, Condensing and cooling, Apparatus for	J. J. Miller	40,662
Evaporating, Saccharine liquids	G. Evans	38,300
Evaporator for saccharine liquids	F. D. Drake	37,339
Evaporator for saccharine liquids	J. H. Hartwell	37,911
Evaporator for saccharine liquids	J. C. Chesney	40,908

Invention or Discovery.	Name of Patentee.	No.
Evaporator for sorghum juice	D. S. Stewart	40, 862
Evaporators, Sugar	O. B. Olmsted	37, 303
Evaporators, Sugar	R. Hamilton	37, 751
Evaporators, Sugar	J. R. Leedy	37, 916
Evaporators, Sugar	C. O. and E. West and J. Carey	38, 254
Evaporators, Sugar	J. A. Bowlus	38, 278
Evaporators, Sugar	A. Whitenack	39, 855
Evaporators, Sugar	T. C. Bartle	40, 232
Evaporators, Sugar	D. Beasley	40, 378
Evaporators, Sugar	S. Hoyt	40, 562
Evaporators, Sugar	J. High	40, 934
Evaporators, Sugar, Automatic feeder for	J. Smead	40, 126
Evaporators, Sugar, with automatic feeder	G. Stevenson	40, 579
Evaporators, Sirup	L. P. Harris	39, 810
Excavating and ditching machines	B. F. Stowell	37, 878
Excavating and dredging machine	C. and J. Atkinson	39, 194
Excavating Machines	W. Hamilton	38, 479
Excavators	D. McNabb	40, 850
Exercising the human body, Machines for	C. F. Taylor	40, 865
Exercising Machine, Infant's	J. S. Brown	38, 028
Eyelet for lacing shoes	J. Antenrieth	37, 328
Eyeleting Machines	J. F. Sargent	37, 306
Eyeleting Machines	L. DeForrest	37, 417
Eyeleting Machines	T. B. DeForrest	37, 418
Eyeleting Machines	J. F. Sargent	39, 705
F.		
Fabrics, Composition for water-proofing	E. L. Simpson	38, 005
Fabrics, Drying and finishing tubular knit	W. K. Greene, jr., and W. N. Pawkins	37, 288
Fabrics, Manufacture of flocked water-proof	E. L. Simpson	38, 006
Fabrics, Mixed, Process of recovering wool from	J. G. Perzel	39, 828
Fabrics, Spreading japan, &c., over	F. Santermeister	37, 592
Fabrics, Textile, Bleaching	T. Schnebel	39, 995
Fabrics, Textile, Manufacture of	T. J. Dunkin	39, 556
Fabrics, &c., Textile, Producing designs on	E. Leitenberger	38, 198
Fabrics with analine compounds, Dyeing and printing a black color on	J. Lightfoot	38, 589
Fabric for insoles	S. M. Allen	40, 593
Fabric for making imitation lace, &c.	H. Loewenberg	40, 633
Fabric for roofing	J. G. Fuller	39, 139
Fags for filing papers, Adhesive	L. Heyle	40, 260
Fan, Fly-expanding	W. R. Fowler	40, 746
Fan Blowers	W. Winter	40, 974
Fan Blowers	M. V. Nobles	40, 982
Fancy Articles, carts, toys, &c., Composition for	M. Schall	39, 070
Fats and oils, Rendering	C. E. Gray	39, 565
Fatty matters from animal substances, Separating	H. A. Aurelung	37, 482
Faucets	W. Pinkerman	39, 585
Faucets	J. Broughton	39, 795
Faucets	J. Leitch	40, 939

Furnaces for heating fires	O. M. Brown	38,029
Furnaces to locomotives, Application of blowers to the.	F. B. Blanchard	40,014
Furnaces for making malleable iron	M. S. Salter	40,710
Furnaces for re-burning bone black	G. Thulemeyer	40,371
Furnaces for reducing and smelting ores	L. G. Marshall	38,906
Furnaces for smelting ores and other purposes	G. W. Sevet	38,186
Furnaces for steam boilers	G. G. Hunt	39,402
Furnaces for steam boilers	H. Germer	40,618
Furnaces for sugar evaporators	A. H. Perry	38,759
Furnaces for sugar evaporators	S. B. Spaulding	40,196
Fuses, Casting	G. Wright	38,352

Invention or Discovery.	Name of Patentee.	No.
Fuses, Firing, by electricity.....	F. E. Bearedlee	39,542
Fuses, Percussion, for explosive shells	J. W. Cochran.....	37,675
Fuses, Percussion, for shells	B. B. Hotchkiss.....	37,756
Fuses, Percussion, for shells	A. H. Emery	40,827
Fuses, Percussion, for shells	W. F. Patterson	40,885
Fuses, Tape.....	J. E. Chase and J. Toy	39,033
Fuse for explosive projectiles, Concussion	J. L. Henry.....	38,797
Fuse for Explosive Shells.....	J. McIntyre	40,350
Fuse for Explosive Shells, Percussion.....	J. W. Cochran.....	37,275
Fuse for Shells, Combined time and percussion.....	J. P. Schenkl.....	39,682
Fuse for Shells, Concussion.....	J. P. Tice.....	38,994
Fuse for Shells, Igniting time.....	A. M. Sawyer.....	38,699
G.		
Gaiters.....	G. W. Ludlow	38,235
Gaiters and Boots.....	J. P. Harron.....	39,614
Gaiters and shoes, Patterns for cutting.....	E. Shopbell.....	37,527
Gaiter Boot Protector.....	F. M. Blodgett.....	40,901
Garments, Spring Hook Fastening for.....	D. M. Smith	38,920
Garments having body and sleeves	H. Osler	38,757
Gas, Apparatus for cooking	W. L. Fish.....	37,745
Gas, Carburetting.....	S. Gwynn.....	38,357
Gas, Carburetting, Apparatus for.....	J. A. Bassett.....	39,541
Gasses, Coking coal and generating.....	W. G. Valentin.....	37,412
Gas, Composition for purifying	J. C. G. Howitz.....	37,815
Gas, Illuminating.....	W. H. Gwynne	37,289
Gas, Illuminating.....	S. L. Wiegand	39,605
Gas, Illuminating.....	S. L. Wiegand	39,606
Gas, Illuminating, Manufacture of.....	W. H. Gwynne	39,227
Gas, Illuminating, Manufacture of.....	W. P. McConnell	39,350
Gas, Illuminating, Manufacture of.....	W. Elmer.....	39,905
Gas, Illuminating, Manufacturing	S. L. Weigand.....	38,438
Gas, Illuminating, Producing	W. Elmer.....	39,388
Gas, Lighting by electricity.....	R. Cornelius.....	38,562
Gas, Manufacture of	W. H. Gwynne	40,925
Gas, Olefiant, Producing.....	W. Elmer.....	39,387
Gas, Water, Manufacture of	W. H. Gwynne	39,480
Gas for illuminations, Treating.....	W. A. Simmonds and S. Warner	38,017
Gas from petroleum and other hydro-carbons, Apparatus for generating.	G. W. Thompson and J. Foster.....	38,429
Gas to soldering apparatus, Regulating the flow of.	T. H. Snyder.....	38,083
Gas from steam and hydro-carbons, Carbu- retting.	W. H. Gwynne	39,342
Gas from water, Producing	W. H. Gwynne	39,393
Gas Apparatus for domestic use.....	W. Mills and O. H. Burdett.....	39,159
Gas Blow-pipes.....	A. H. Wood	40,376
Gas Compensator	A. Smith.....	40,085
Gas Heating Apparatus	S. L. Wiegand.....	40,591
Gas Regulators.....	R. Cornelius.....	38,561
Gas Regulators.....	F. W. Brocksieper.....	40,602
Gas Regulators and Purifiers.....	P. Fontain	37,500
Gas retorts with liquids, Supplying	E. L. Norfolk.....	40,058
Gases, Generating, for heating and illumina- tion.	J. Arbos.....	40,804
Gases, Mixing.....	W. D. Parrish	38,499
Gases for Motive Power	J. Arbos.....	40,805
Gates.....	D. R. Warfield.....	37,536
Gates.....	J. M. Peirce.....	38,331
Gates.....	W. Worth.....	39,520
Gates.....	S. G. Farnham.....	40,557
Gates.....	J. S. Corbin	40,609
Gates.....	F. F. Blood.....	40,902
Gates, Automatic	J. W. Foster.....	38,304
Gates, Automatic	L. S. Deming.....	39,798

Invention or Discovery.	Name of Patentee.	No.
Gates, Farm	W. C. Herider	39,044
Gates, Farm	E. Nicholson	39,491
Gates, Farm	A. C. Teel	40,777
Gate Catches	W. W. Robinson	40,187
Gauge, Steam	T. Shaw	37,794
Gauges, Water, for steam boiler	E. W. Vanduzen	37,534
Gauge, Water, for steam boilers	G. Mann, jr.	40,272
Gauge for Metal Planing	H. H. Jennings	39,404
Gauges for railroad tracks	W. Crooks	40,247
Gear Cutting	A. T. Boon	40,550
Generators, Steam	E. & J. Bourne	37,382
Generators, Steam	W. C. Baker	40,722
Giffard's Injector	N. Cope	37,542
Gilt Moulding, Manufacture of imitation	H. W. Ladd	38,588
Gimlet	A. Pell	37,973
Glass, Porcelain, &c., by the ofluo-silicates, Manufacture of.	T. Cobley and J. C. Combe	38,286
Glass, Removing stains from	J. G. Pohle & J. N. Crow	37,975
Glass, Substitute for	C. Süssegger	39,265
Glassware, Annealing	E. Deithridge	38,930
Globes, School	J. R. Agnew	38,875
Globes, Solar time	T. R. Timby	38,183
Gold from pyrites, Extracting	G. F. Deetkin	37,278
Gold and silver, Amalgamating	Z. Wheeler	40,874
Gold Washer and Amalgamator	M. Battel	37,268
Governors	W. F. Burden	38,215
Governors, Centrifugal	J. C. Clime	37,609
Governors, Engine, Steam	J. D. Humphreys	40,754
Governors, Marine	H. J. Behrens	37,944
Governors for steam engines	F. Douglas	39,799
Governors for steam engines	L. Eikenberry	39,903
Grading Machines	W. Spalding	37,831
Grain, &c., Apparatus for drying	S. Marsh	37,632
Grain, Cleaning, Hulling, and Grinding	E. Cole	38,948
Grain, Malt, &c., Drying	S. Marsh	37,403
Grain, &c., for malting, Preparing	S. Weidenfeld	38,347
Grain, &c., Measuring	C. Ross	39,959
Grain, Measuring	T. Wilson	39,980
Grain, Stirring and Drying	T. C. Vice	37,467
Grain and Straw Separator	A. Major	37,549
Grain Binder	J. Judevine and Z. Shaw	39,234
Grain Binders	W. W. Burson	39,463
Grain Binders	W. D. Harrah	41,002
Grain Binders, Automatic	R. D. Brown	38,093
Grain Cleaners	G. Clask	38,258
Grain Cleaners	J. Hutchison	40,840
Grain Cleaner and Separator	J. W. Patterson	40,942
Grain Conveyers	O. C. Dodge	37,615
Grain Distributers	L. P. Haradon	37,291
Grain Dryers	C. W. T. Krausch	37,869
Grain Dryers	J. B. Wheeler	38,191
Grain Dryers	E. Trenholm	38,614
Grain Dryers	H. H. Beach	38,723
Grain Dryers	P. C. Schuyler and S. W. Warren	38,790
Grain Dryers	R. S. Reynolds	38,985
Grain Dryers	M. C. Cogswell and A. G. Williams	39,466
Grain Dryers	L. S. Chichester	39,630
Grain Dryers	W. H. Dole and D. R. Fraser	39,722
Grain Dryers	W. H. Sutton and J. J. Gibson	40,130
Grain Dryers	T. Wallace	40,219
Grain Dryers	R. T. Sutton	41,028
Grain Drying	J. Babillion	37,800
Grain Drying Apparatus	C. W. T. Krausch	38,048
Grain Fork	H. M. & W. W. Burson	39,464
Grain Scourer	G. E. Throop	41,031
Grain Screen	W. G. Hoag	39,963

Invention or Discovery.	Name of Patentee.	No.
Grain Separators.....	H. Siddall	37, 362
Grain Separators.....	J. Faulkner.....	37, 440
Grain Separators.....	A. Sylvester.....	38, 251
Grain Separators.....	O. W. Stanford and A. W. Crane.....	38, 425
Grain Separators.....	J. & D. Schildhauer.....	38, 844
Grain Separators.....	M. J. Barcalo	38, 937
Grain Separators.....	J. J. Palmer and A. Plamondon.....	39, 063
Grain Separators.....	H. Siddall	38, 073
Grain Separators.....	E. Youngs.....	39, 090
Grain Separators.....	J. Fergusson and C. C. Burt	39, 093
Grain Separators.....	H. B. Thomas.....	39, 262
Grain Separators.....	C. R. Barnes.....	39, 374
Grain Separators.....	A. Hunter	40, 340
Grain Separators.....	N. H. Sherburne.....	40, 505
Grain Separators.....	J. S. Bodge	40, 548
Grain Separators.....	C. Bates.....	40, 670
Grain Separators.....	L. P. Josse	40, 756
Grain Separators.....	J. A. and J. W. Miller.....	40, 767
Grain Separators.....	J. F. & H. D. Cummings.....	40, 995
Grain Separators.....	J. Gray.....	41, 000
Grain Separators.....	J. Van Houten.....	41, 032
Grain Separators.....	B. S. Heyers.....	41, 041
Grain Separators and Cleaners	D. W. Harshbarger.....	39, 146
Graining in imitation of wood, Tools for	R. A. Adams.....	40, 224
Graining Tool	N. J. Potter and W. H. Arnold	39, 953
Granaries	A. C. L. Devaux	39, 030
Granaries	T. Hermans.....	40, 261
Grapes, apples, &c., Grinding and pressing	C. B. Hutchinson.....	37, 579
Grass, seed, and clover, Threshing and cleaning.	D. Shattuck.....	38, 538
Grass Seeder, Harrow Drill, and Roller, combined.	J. P. Long	38, 495
Grates	W. Wright.....	37, 933
Grates	C. J. Woolson.....	38, 194
Grates	W. L. McDowell.....	38, 317
Grates	S. Stevens and J. P. Smith.....	39, 969
Grates	J. Walton, jr.....	40, 315
Grates	S. J. Kelley	40, 341
Grates, Fire.....	W. D. Guseman.....	39, 043
Grates, Fireplace.....	M. C. Hull.....	39, 928
Grates, Furnace.....	G. L. Smith.....	40, 712
Grates, Hot-air.....	T. E. Randolph.....	41, 019
Grates, Stove.....	G. H. Phillips and W. H. Johnson.....	40, 146
Grates for Furnaces.....	T. T. Holdsworth.....	39, 573
Grates for Furnaces.....	A. Winterburn	40, 532
Grates for Stoves	L. W. Harwood.....	39, 811
Grates and stoves, Aprons for	W. Hughes	38, 227
Grate for stoves and furnaces.....	G. V. Heyden.....	40, 781
Grindstones, Facing.....	J. Bidwell	38, 782
Grubbing Machines.....	J. Fry.....	37, 574
Guanos, Treating phosphatic.....	L. D. Gale.....	38, 040
Gums, Vulcanizable, Filling moulds with.....	J. C. Howells	39, 481
Guns, Removing Spikes from	A. Lafever.....	40, 051
Guns, Sighting.....	E. A. Stevens.....	37, 365
Guns and gun towers, Operating	J. B. Eads.....	38, 038
Gun Barrels, Manufacture of.....	R. A. Douglas.....	38, 201
Gun Carriages, Operating	R. H. Long.....	39, 449
Gun Carriages, Operating.....	S. J. Ashley	40, 893
Gun Carriages, Operating.....	J. Ericsson	40, 919
Gun Lock	J. H. Sharpley	39, 501
Gunpowder	J. F. E. Schultze.....	38, 789
Gunpowder, Composition for.....	H. Liebert.....	37, 296
Gun-stock, Machinery for carving and drilling.....	J. P. Pusey	37, 705
Gun-stock Machine	E. S. Wright and E. Allen.....	40, 665
Gun-stock Machine	E. S. Wright and E. Allen	40, 666
Gun-stock Machine	E. S. Wright and E. Allen	40, 667

Invention or Discovery.	Name of Patentee.	No.
H.		
Hair Crimpers.....	H. H. Adams.....	38, 010
Hair Restoratives.....	J. Moyer.....	39, 304
Hame Tug.....	L. Hall.....	39, 143
Hammers, Steam, Valve-gearing for.....	R. Morrison.....	37, 357
Hammers, Trip.....	L. Kinsley.....	37, 628
Hammers, Trip.....	J. Briggs.....	40, 390
Hammers, Trip, Atmospheric.....	B. Hotchkiss.....	39, 924
Hams, Composition for covering.....	H. A. Ameling.....	40, 803
Handles, Tool.....	I. S. Clough and J. N. Bonnell.....	37, 333

Harvesters.....	T. Brett.....	40, 601
Harvesters.....	A. Brown, L. G. Kniffin, and T. H. Dodge.	40, 658

Invention or Discovery.	Name of Patentee.	No.
Harvesters	I. H. Collier	40, 675
Harvesters	V. W. Blanchard	40, 812
Harvesters	W. A. Sweet	40, 864
Harvesters	W. Jones	40, 883
Harvesters	I. H. Palmer	41, 016
Harvesters	S. Hull	41, 040
Harvesters, Binding attachment to	H. M. and W. Busson	37, 852
Harvesters, Binding attachment to	A. Underwood	39, 510
Harvesters, Corn	G. Geer	38, 738
Harvesters, Corn	O. N. Chere	40, 243
Harvesters, Corn	T. A. Risher	40, 979
Harvesters, Flax	S. W. Tyler	30, 764
Harvesters, Grain dischargers for	J. D. Corrynee	40, 676
Harvesters, Rake and reel for, Combined	W. A. Wood	40, 876
Harvesters, Raking attachment for	I. B. Snyder	37, 363
Harvesters, Raking attachment to	B. Smith	39, 249
Harvesters, Raking attachment to	I. S. and H. R. Russell and J. J. D. Bristol	39, 329
Harvesters, Raking and binding attachment to	T. Palmer	37, 408
Harvesters, Self-rakes for	R. D. Brown	38, 094
Harvesters, Track clearers for	J. O. Taber	38, 007
Harvester Cutter-bar connexion	G. W. D. Culp and W. J. Keeney	39, 633
Harvester Cutter-sharpener	J. K. Staman	39, 866
Harvester finger	E. P. Russell	40, 283
Harvesting Machines	J. Jann	39, 403
Harvesting Machines, Dividers for	W. A. Wood	37, 995
Harvesting Machines, Header attachments to	G. Esterly	37, 392
Hatching Poultry	G. F. Quick	40, 277
Hats	F. P. Flanagan	38, 895
Hats	W. H. Mallory	39, 822
Hats, Apparatus for determining the form and size of the head, and adapting thereto	J. F. Kleim	37, 759
Hats, Apparatus for pressing	H. L. Sweet	38, 067
Hats, Dies for forming	R. T. Wilde and S. H. Lyon	37, 993
Hats, Forming bell-crown	W. E. Doubleday	37, 682
Hats, Pressing	J. F. Mathias	40, 419
Hats, &c., Sizing	H. E. Pond	40, 886
Hats, Stretching	J. W. Blackhand	41, 036
Hats and bonnets, Manufacture of palm leaf	D. C. Perin	37, 409
Hat Blocks	J. H. Masker	39, 299
Hat Bodies, Stretching	T. G. Oakley and W. R. Finch	40, 383
Haversacks	T. Keeck	40, 047
Hay Elevating Forks	G. C. Howard and I. N. Willfong	37, 965
Hay Elevating Fork	L. Randell	38, 129
Hay Forks, Horse	S. L. Gates	39, 641
Hay Forks, Self-tightening bands for	J. H. Melick	40, 701
Hay Loaders	C. B. Garlinghouse and J. Dickason	39, 214
Hay Loaders	W. L. Hubbell	39, 655
Hay Loading	G. Constable	39, 215
Hay Loading Machines	W. H. Bently	40, 598
Head, Coverings for	T. S. Lambert	40, 382
Heat and Light, and applying the same, Producing	L. L. Hill	38, 137
Heaters	T. Dowling	39, 385
Heaters	J. S. Reid	39, 750
Heaters	E. Sprague	40, 366
Heaters	A. Wellers	40, 375
Heaters, Coal oil	H. W. Dopp	39, 129
Heaters, Dish	W. Brand	39, 459
Heaters, Lamp	W. T. Eddy	38, 102
Heater for locomotives, Feed-water	B. Crawford	38, 730
Heaters for steam boilers, Feed-water	R. C. Bristol	37, 731
Heaters for steam boilers, Feed-water	W. W. Martin	38, 870
Heating Apparatus	E. C. Gillette	39, 041

Invention or Discovery.	Name of Patentee.	No.
Heating Apparatus, Cooking and steam.....	E. Whitely.....	40, 300
Heating purposes, Method of using exhaust steam for.	B. T. Babbitt.....	38, 021
Heel Iron and Ice-calk	W. Weaver	39, 514
Heel Polishing Machine	B. Q. Budding	39, 546
Hemming and Tucking Guides.....	G. W. Downes.....	38, 662
Hemostatic and Antiseptic Agents, Preparation to serve as.	P. A. F. Bobocuf.....	38, 940
Hemp and Flax, Breaking.....	G. Sanford and J. E. Mallory.....	38, 340
Hemp, Flax, &c., Breaking and cleaning.....	G. Sanford and J. E. Mallory.....	38, 916
Hemp, Flax, &c., Breaking and cleaning.....	G. Sanford and J. E. Mallory.....	39, 962
Hemp, Flax, &c., Breaking and cleaning.....	G. Sanford and J. E. Mallory.....	40, 063
Hemp and Flax, Drying.....	G. W. Billings	40, 236
Hemp and Flax Drying Frame.....	G. W. Billings	40, 155
Hemp and Flax, Rotting.....	G. W. Billings	40, 154
Hemp, Flax, &c., to a fibrous condition, Reducing.	R. Sherwood	40, 577
Hemp Machine	G. Ehram	39, 219
Hides, Handling.....	B. B. Mereness.....	39, 824
Hides preparatory to tanning, Smoothing out.	J. F. Flanders	40, 680
Hides and Skins, Liquid composition for bating.	R. Wager.....	38, 267
Hinges, Gate.....	W. W. Robinson.....	38, 843
Hinges, Gate.....	J. T. Watson	40, 314
Hinges, Sliding.....	J. M. Eveleth and G. C. Moore.....	37, 684
Hinges, Spring.....	L. Bornmer	40, 879
Hinges, Window, Self-locking.....	J. R. Murphy.....	40, 145
Hinges for blinds	W. L. Barnes.....	38, 876
Hoes	E. C. and J. W. Newland	37, 405
Hoes.....	J. Ells.....	40, 826
Hoes, Planting.....	C. N. Jones.....	40, 107
Hoe, spade, fork, and rake, Combined.....	T. Goodren.....	39, 012
Hoisting Apparatus	H. Pennepacker.....	39, 745
Hoisting Machines.....	W. Miller	38, 497
Holders, Bill	A. Burwell.....	37, 949
Holders, Bill and currency.....	G. B. Isham	39, 148
Holders, Cap, Percussion.....	T. B. Lamb.....	40, 487
Holders, Mark, for bales, &c.....	P. Fitch	38, 363
Holders, Mark, for bales.....	H. W. Goodrich and E. A. Locke.....	68, 365
Holders, Sewing-work.....	A. M. Smith	39, 966
Holders of tools for grinding	G. Lissenden and J. Lacey	39, 054
Hone and Strap, Combination of the.....	G. Snyder.....	39, 362
Hoods, Riding stirrups and.....	R. N. Eagle	39, 133
Hooks, Belt.....	T. E. Oliver.....	40, 182
Hooks, Boat detaching	W. W. Andrews	37, 799
Hooks, Chain.....	G. H. Draper	38, 532
Hooks, Clothes and hat.....	G. B. Fowler.....	40, 923
Hooks, Horse hay.....	A. Kratz.....	40, 628
Hooks, Locking Safety, for tow-lines.....	D. De Garmo.....	37, 681
Hooks, Pruning.....	A. Travis	40, 869
Hooks, Snap	D. W. Lewis.....	39, 295
Hooks, Snap.....	F. Palmer.....	39, 351

Legs, Artificial	S. D. Small.....	40, 956
Legs, Artificial	R. M. Vaughn	41, 033
Legs, Artificial Supports for	P. Daniels	37, 738
Lemonade, Composition for	A. Warner	37, 314
Lenses, Grinding and Polishing.....	M. Witner	40, 303
Letter Boxes for post offices.....	C. H. Bradley	39, 879
Levels, Plumb	W. H. and D. D. Polleys	40, 428
Levels and Plumb, Combined	F. A. Trout	38, 252
Levers, Engine	T. W. Godwin	38, 364
Levers, Engine	T. W. Godwin	39, 564
Lever and Crank Motion, Combined	E. Nott	38, 176
Life-preserver	S. Scholfield.....	39, 175
Light, Deck	E. S. Hidden	40, 479
Lights for vessels, Deck.....	J. Sutton and J. Gregory	38, 342
Light and Heat and applying the same, Producing.....	L. L. Hill	38, 137
Lightning Conductors, Insulators.....	E. Eagles	39, 613
Limbs, Artificial	H. A. Kimbald.....	39, 578
Limbs, Artificial	A. A. Marks.....	40, 763
Limbs, Wounded, Supporting and Ventilating.....	G. S. Fowler.....	40, 164

Invention or Discovery.	Name of Patentee.	No.
Lime, Neutral sulphite of, Manufacture and use of.	E. N. Horsford.....	39, 922
Liniment.....	E. Conway.....	37 901
Liniment, Compound for.....	M. C. Ross.....	40 642
Liniment, Rheumatic.....	L. E. Anderson.....	40, 668
Liniment for rheumatism, &c.....	S. Galland.....	40, 686
Link for railway horse-powers.....	S. Wheeler.....	38, 778
Liquids, Air-condensing apparatus for forcing.	H. Straler, jr.....	38, 250
Liquids, Cooling.....	A. Smith.....	41, 024
Liquids, Detecting sugar, &c., in waste.....	G. A. Jasper.....	41, 008
Liquids, saccharine and other, Evaporating.....	D. Harris.....	38, 386
Liquids for galvanic batteries.....	D. H. Fitch, jr.....	38, 894
Liquid composition for bating skins and hides.	R. Wager.....	38, 267
Liquors, fermented, cooling, and discharging.	F. M. Brunon.....	40, 977
Litter, tent and knapsack, combined.....	L. Joubert.....	39, 150
Locks.....	W. Hall.....	37, 290
Locks.....	H. H. Elwell.....	37, 390
Locks.....	J. W. Mix.....	37, 515
Locks.....	J. T. Mygatt.....	37, 700
Locks.....	A. M. Hill.....	38, 080
Locks.....	J. L. Hall.....	38, 384
Locks.....	R. S. Foster.....	39, 002
Locks.....	R. S. Foster.....	39, 003
Locks.....	R. S. Foster.....	39, 004
Locks.....	R. S. Foster.....	39, 005
Locks.....	R. S. Foster.....	39, 006
Locks.....	R. S. Foster.....	39, 007
Locks.....	R. S. Foster.....	39, 008
Locks.....	R. S. Foster.....	39, 009
Locks.....	R. S. Foster.....	39, 010
Locks.....	S. N. Long and M. E. Hathaway.....	39, 056
Locks.....	A. Clabaugh.....	39, 117
Locks.....	H. H. Elwell.....	39, 280
Locks.....	R. S. Foster.....	40, 077
Locks.....	T. G. Harold.....	40, 724
Locks.....	T. G. Harold.....	40, 882
Locks, Alarm.....	G. N. Bruster.....	38, 556
Locks, Car seat.....	R. B. More.....	39, 303
Locks, Car seat.....	G. McGregor.....	40, 113
Locks, Door, and latches.....	W. S. Munger.....	39, 203
Locks, Guard attachment for.....	W. Miller.....	40, 115
Lock, Gun.....	J. H. Sharpley.....	39, 501
Locks, Permutation.....	J. Connell.....	38, 858
Lock, Row.....	W. H. Willard.....	39, 188
Locks, Window sash.....	W. E. Arnold.....	40, 138
Locks, Window sash.....	W. E. Arnold.....	40, 139
Lock and bolt, Improvement in.....	E. O. Frink and C. E. McDonald.....	39, 223
Locks and keys.....	F. A. H. Gaebel.....	38, 476
Locks and latches.....	B. Mallory.....	38, 400
Lock and latch, Door.....	E. Halley.....	39, 770
Locks to safe doors, Applying.....	J. J. Burnet and W. Bellamy.....	39, 001
Locks in tin plate, Forming.....	E. Manley.....	37, 629
Locks for wheel vehicles.....	J. H. Lee.....	39, 581
Locket, watches, &c., Toy, Constructing.....	L. Flagg and G. D. Briggs.....	40, 255
Locomotives.....	P. H. Corlett.....	40, 554
Locomotives, Draught regulator for.....	P. H. Corlett.....	40, 555
Locomotives, Fire boxes of.....	J. P. Laird.....	40, 630
Locomotives, Fire boxes of.....	C. Dean.....	40, 743
Locomotives, Running gear of.....	T. H. Neal.....	39, 060
Locomotives, Smoke-stacks for.....	A. S. Sweet, jr.....	38, 992
Locomotives, Spark-extinguishers for.....	P. H. Corlett.....	39, 552
Locomotives, Variable exhaust for.....	R. McDowell.....	39, 583
Locomotives upon car tracks, Support of.....	A. S. Sweet, jr.....	40, 290
Locomotive horses for vehicles, &c.....	P. W. Mackenzie.....	39, 349
Locomotive tender.....	A. Sturrock.....	40, 715
Looking-glass and match holder.....	D. Cumming, jr.....	39, 277

Invention or Discovery.	Name of Patentee.	No.
Looms.....	W. Breitenstein.....	38, 195
Looms.....	O. C. Smith.....	38, 265
Looms.....	B. H. Jenks.....	38, 489
Looms.....	J. D. Cottrell.....	40, 442
Looms.....	M. A. Furbush.....	40, 683
Looms.....	J. W. Drummond.....	40, 685
Looms.....	B. A. Mann.....	40, 698
Looms, Circular.....	W. Darker, jr.....	39, 197
Looms, Fancy.....	L. J. Knowles.....	37, 760
Looms, Jacquard.....	H. W. Hensel and L. D. Valetton.....	38, 929
Looms, Let-off mechanism for.....	G. Draper.....	39, 469
Looms, Pickers for.....	J. Cady.....	39, 714
Looms, Power.....	B. H. Jenks and J. Shinn.....	38, 534
Looms, Power, Device for stopping the shuttle in.....	D. S. Esten.....	39, 803
Looms, Power, Shuttle device for.....	A. S. Lyon.....	37, 513
Loom, Power, for weaving tufted pile fabrics.....	H. Skinner.....	39, 759
Looms, Roller temples for.....	W. W. Dutcher.....	37, 954
Looms, Shipper cover for.....	G. W. Hathaway.....	37, 577
Looms, Stop motion for.....	G. Draper.....	39, 723
Looms for weaving corsets.....	B. J. Goulliond.....	37, 547
Looms for weaving corsets.....	W. Breitenstein.....	37, 556
Lounge or chair, Folding.....	J. Sutter.....	40, 512
Lozenges, Manufacturing.....	O. R. Chase.....	39, 196
Lubricating composition.....	A. Bauer.....	38, 459
Lubricating, Composition for.....	A. Hamill.....	38, 822
Lubricating, Composition for.....	J. Turner.....	39, 185
Lubricating, Composition for.....	C. Grath.....	40, 835
Lubricators.....	A. J. Judge.....	37, 627
Lubricators.....	W. W. W. Wood.....	38, 526
Lubricator.....	J. R. Lees.....	40, 433
Lubricators.....	T. W. Godwin.....	40, 475
Lubricators.....	T. W. Godwin.....	40, 560
Lubricators.....	H. Campbell.....	40, 673
Lubricator for locomotive engines.....	E. C. Hamlin.....	38, 962
Lumber, Edging.....	L. A. Ensworth and B. Barker.....	37, 496
Lumber, edging, splitting, and re-sawing, Sawing machines for.....	A. Cushing.....	37, 334
Lumber, Machine for cutting thin.....	B. F. Betts.....	39, 113
Lumber raft.....	G. W. Tower.....	38, 343
M.		
Machinery, lubricating, Composition for.....	S. Balsden.....	40, 229
Machinery, Oil Caps for.....	T. W. Godwin.....	40, 032
Magnets, Receiving.....	S. F. Van Choate.....	40, 133
Magnets, Telegraph.....	S. F. Van Choate.....	38, 774
Mail bags, Device for closing.....	G. M. Rhoades.....	37, 641
Maize, Brewing with.....	L. Haecker.....	40, 836
Malt, &c., Extract of, for making beer, ale, and porter.....	F. Hawks.....	37, 578
Malt, grain, &c., Drying.....	S. Marsh.....	37, 403
Malt liquors, Cooling.....	O. Hoepfner and C. Schnepf.....	40, 262
Mangle.....	C. C. Converse.....	40, 022
Mangling, washing, and wringing machine.....	E. Chipman.....	40, 159
Mangling, washing, and wringing machine, Combined.....	T. Farnsworth.....	37, 439
Manifolds, Arrangement of conducting pipes.....	C. C. Walworth.....	38, 433
Manure, Manufacture of.....	P. Eley.....	39, 525
Manure, Preparing night-soil for.....	R. B. Fitts.....	37, 685
Manure or fertilizer.....	G. F. Wilson.....	39, 519
Manure distributors.....	J. B. Crowell.....	38, 949
Manure distributor.....	J. Cadwell.....	40, 605
Maps, writings, &c., Process of copying.....	J. Underwood.....	38, 086
Map case and black board.....	W. C. Herider.....	40, 035
Marble, Artificial variegated.....	A. & I. Straub.....	40, 650
Marine logs, Registering.....	A. Gordon.....	40, 834

Invention or Discovery.	Name of Patentee.	No.
Marine Propulsion, Apparatus for.....	F. W. Harris	39, 394
Mark or Label for bales of cotton, &c., Incor- rodible.	H. D. Mears.....	39, 944
Mark Holder for bales, &c.....	H. W. Goodrich and E. A. Locke ..	38, 365
Marking Brands.....	G. H. Strong.....	39, 261
Martingales, Rings for	W. M. Welling	37, 941
Masts, Booms to, Means for attaching	M. McLain.....	40, 273
Matches, Friction.....	J. R. Dey	38, 096
Matches, Friction, Manufacture of.....	J. W. Hjerpe.....	40, 259
Matches, Lucifer, Dipping.....	S. A. Bell and T. Higgins.....	38, 878
Match and Looking-glass Holder	D. Cumming, jr.....	39, 277
Match Blocks, Splitting	V. R. Powell	38, 911
Match splints for dipping, Framing lucifer.....	A. & E. B. Beecher	37, 562
Match Stand, Friction.....	N. Waterman.....	38, 923
Match Sticks, Manufacture of	S. C. Ellis.....	40, 027
Mats, Oil press.....	H. Nutt.....	39, 671
Mattresses, Pillows, &c., Stuffing for.....	A. C. Crondal	40, 024
Measuring and weighing, Apparatus for.....	N. Smith.....	38, 511
Meat Broilers.....	G. B. Ranson	37, 360
Medicines, Hog-cholera	F. La Rew	38, 169
Medicines, Wagon for transporting	T. M. Perot.....	39, 951
Medicine for curing foot-rot in horses, &c	E. W. Wakefield.....	40, 297
Medicine for Piles.....	W. Carr	38, 466
Medicine Case.....	T. M. Perot.....	39, 952
Merchandise or Freight, Unloading.....	R. Bragg	38, 725
Mercurial Ointment, Nitrated.....	C. Learned.....	37, 697
Mercury and Amalgam from ore pulp, Col- lecting.	Z. Wheeler.....	39, 251
Metals, Amalgamating precious.....	E. Coleman	39, 550
Metals, Amalgamating precious	J. B. Atwater.....	40, 893
Metals, bending, Machines for.....	C. H. Delamater	39, 382
Metal, Construction of rolls for rolling.....	D. Reeves.....	38, 869
Metals, Corrugating.....	S. J. Seely.....	37, 593
Metals, Grinding ores and amalgamating prec- ious.	J. G. Prandall	40, 501
Metals, Improvement in the quality and orna- mentation of.	W. Rose	39, 174
Metals, Rolling.....	J. B. Mignault, A. B. Southwick, C. Spofford, and A. Marshall.	37, 601
Metals, Rolling and forging.....	S. Vanstone	37, 368
Metal, Sheet, Bending corrugated	S. J. Seely.....	37, 308
Metal, Sheet, Bending corrugated	S. J. Seely.....	37, 362
Metal, Sheet, Corrugating	T. W. H. Moseley	39, 418
Metal, Sheet, Packing for transportation	D. McDaniel	37, 323
Metal for Horse Hoes, &c	J. Kennelly	38, 046
Metal Bars, Drawing or Forging	W. Beach	38, 090
Metal Eaves Troughs, Soldering sheet.....	E. H. Camp	37, 950
Metal Plates, Corrugating	J. Francis.....	38, 799
Metal Pointing Machine	A. Molts	41, 014
Metal Sheets, Turning Edges of Plates or	J. F. Morgan	38, 115
Metal Surfaces, Uniting	W. B. Barnard.....	37, 555
Metal Vessels, Pressing and Polishing.....	J. Neumann.....	37, 822
Metallic Buhrs	A. T. Boon	40, 549
Metallic Surfaces, Finishing	G. Cowing	38, 565
Meters, Gas	J. S. Elliott.....	39, 904
Meters, Gas.....	H. H. & J. Kromschroedor.....	40, 266
Meters, Gas, Dry.....	C. C. Lloyd	38, 448
Meters, Gas, Dry.....	D. Alcorn	39, 266
Meters, Gas, Dry.....	J. E. Fisk.....	39, 907
Meters, Fluid.....	J. Sheffield.....	40, 504
Meters, Water.....	J. Percy	37, 588
Meters, Water.....	H. Burt.....	37, 658
Meters, Water.....	F. G. Johnson	40, 485
Mica Lamp Chimneys.....	W. P. Ware	37, 837
Milk Racks.....	R. Cruikshank.....	38, 625
Mills, &c., Apple.....	S. Keler.....	37, 510

Invention or Discovery.	Name of Patentee.	No.
Mills, Boring, Apparatus for adjusting ord- nance in.	S. D. Dean	40, 824
Mill, Cane	D. M. Cook	39, 467
Mills, Cider	S. A. Hebard	39, 731
Mills, Cider	J. Bowen	40, 237
Mills, Cider	T. Sharp	40, 711
Mills, Cider, Cornshellers, and Fodder Cutters, Combining.	J. P. Adams	39, 620
Mill, Coffee and Spice	C. W. Pierce	37, 358
Mill, Fanning	H. Kelly and W. Franklin	40, 937
Mills, Fulling	T. J. Mayall	40, 700
Mills, Grinding	E. Brisson	37, 605
Mills, Grinding	A. H. Searfoss	37, 793
Mills, Grinding	A. H. Wagner	37, 796
Mills, Grinding	A. H. Wagner	38, 795
Mills, Grinding	G. Eberius and F. A. Heinig	39, 558
Mills, Grinding	B. Kenoyer	39, 735
Mills, Grinding	C. Bollinger	39, 793
Mills, Grinding	S. S. Honard	40, 078
Mills, Grinding	J. A. Forsman	40, 467
Mills, Grinding, Regulator for	A. B. Hamaker	39, 648
Mills, Quartz, or Crushers	T. M. Randell	40, 854
Mills, Rolling	T. F. Rumbold	39, 960
Mills, Saw	A. Cushing	37, 335
Mills, Saw	D. C. Gibbs	38, 477
Mills, Saw	H. Caslow	39, 338
Mill, Saw, Carriages, Turning logs on	W. L. Oliver and A. J. Hancock	38, 756
Mills, Saw, Feeding device	N. H. Buschmann	40, 816
Mills, Saw, Head Block for	G. Hagenmeyer	39, 647
Mills, Saw, Head Block for	M. W. Danks	40, 248
Mills, Saw, Head Block for	E. B. Requa	40, 502
Mills, Saw, Scroll	W. H. Doanse	38, 471
Mills, Smut	B. T. Trimmer	39, 598
Mills, Smut	D. Pease	40, 060
Mills, Smut	L. D. Broad	40, 238
Mill, Sugar-cane crushing	I. Straub	39, 182
Mills, Tramp and Level for	J. M. Seldomridge	38, 508
Mills for crushing sugar-cane	G. H. Laut	40, 938
Mills for grinding fruit, grain, &c	W. N. Whiteley, J. Fassler, and O. S. Keeley.	40, 987
Mill Pick	L. M. Osborn	40, 183
Mill Stands, &c., Rolling	W. F. Burden	37, 274
Millstones	D. Drawbaugh	38, 296
Millstones, Balancing and Ventilating	S. N. Page	39, 167
Millstones, Elevating	A. M. Bruckart	37, 732
Millstones, Levelling the face of	D. Drawbaugh	38, 472
Millstones, Stopping	A. Reeder	38, 761
Millstone Bush	J. F. McKray	38, 971
Mirrors, Pictures, &c., Manufacture of wooden mouldings or strips for the frames of.	R. J. Marcher	38, 314
Missiles, Means of checking and resisting	A. C. Twining	39, 363
Mitre Dovetailing, Machine for	F. A. Gleason	37, 910
Mittens for drivers, Water-proof	F. J. Merryman	39, 665
Mop	R. H. Ewing	38, 734
Mop, Tar	J. W. Midwinter	40, 420
Mop Head	E. D. Murphy	39, 305
Mop Head	J. S. Harris	39, 730
Mortising Machine	H. C. Smith	39, 502
Mortising Machine, Power	G. W. Gould	38, 898
Mosquito Bar	A. L. Carrier	39, 116
Mosquito Canopy	S. Roebuck	38, 339
Mosquito Frames	L. S. Thompson	37, 779
Mosquito Netting, Stretching and folding	J. A. and L. Van Riper	39, 868
Motion, Changing	R. G. Turner and H. Stone	40, 965
Motion, Converting	P. Dickson	37, 953
Motion, Device for converting	R. H. Bishop	37, 806

Invention or Discovery.	Name of Patentee.	No.
Motion, Mode of converting.....	S. C. Ketchum.....	38, 311
Motion, Mode of directing.....	A. Buchanan.....	40, 075
Motion Treadle.....	A. W. Harris.....	38, 107
Motion for drawing heads, Stop.....	B. O. Paige.....	37, 823
Mould, Drain tile.....	J. J. Alvord.....	39, 621
Moulds, Filling with vulcanizable gums.....	J. C. Howell.....	39, 481
Moulds, Sand, Applying wash to.....	D. Robinson.....	39, 589
Moulds, Sugar.....	A. Mayer.....	37, 514
Moulds for castings.....	J. R. Davis.....	37, 857
Moulds for casting chilled rollers.....	A. Hammond.....	40, 167
Mould for casting horseshoes.....	J. Kennelly.....	38, 047
Moulds for casting printing types.....	R. W. & D. Davis.....	40, 076
Moulds for casting shells.....	A. J. Eddy.....	37, 388
Moulds for vulcanizing rubber soles for boots and shoes.	C. McBurney.....	38, 688
Mouldings, &c., Applying metal leaf to.....	R. J. Marcher.....	40, 055
Mouldings, Gilt, Manufacture of imitation.....	H. W. Ladd.....	38, 588
Mouldings, Planing oval.....	F. Brandon.....	38, 461
Moulding Machines.....	H. A. Lee.....	40, 269
Moulding Machines.....	H. J. Seymour.....	40, 286
Moulding Machine, Wood.....	J. Stock.....	40, 511
Moulding Machine Feed.....	L. Gould.....	39, 226
Movements, Mechanical.....	R. B. Davidson.....	39, 891
Mowing Machines.....	J. D. Wilber.....	37, 656
Mowing Machines.....	J. E. Wood.....	37, 932
Mowing Machines.....	J. P. Greeley and L. W. Buxton.....	39, 286
Mowing Machines, Hand.....	H. Fisher.....	38, 381
Music, Keyed instruments of.....	F. Peabody.....	40, 573
Musical Instrument.....	W. Davis.....	40, 333
Musical Instruments, Device for carrying off water from.	G. F. Dallon.....	38, 218
N.		
Nails, Arranging, for use in machines for nailing shoes.	O. Gilmore.....	37, 909
Nails, bolts, and rivets, Attaching the heads of.	G. B. Brayton.....	38, 652
Nails, Cutting.....	W. A. Sweet.....	40, 514
Nails, Horseshoe and others, Making.....	B. W. Pierce.....	37, 640
Nails, &c., in picture or other frames, Device for driving.	W. Bascom.....	39, 985
Nails, Shoe, Making.....	W. H. Field.....	37, 340
Nails for horseshoes, Making.....	W. C. Grimes.....	39, 287
Nail or tack, Carpet.....	W. P. Patton.....	38, 598
Nail Machines.....	W. H. Field.....	38, 665
Nail Machines, Grinding dies for.....	G. B. Wiggin and J. W. Hoard.....	37, 657
Nail Machines, Grinding the upper cutter of.	G. B. Wiggin and J. W. Hoard.....	38, 439
Nail Plate Feeders.....	J. S. Fisk.....	39, 105
Naphtha, petroleum, &c., Deodorizing.....	R. N. Warfield.....	40, 068
Needles.....	A. J. Ambler.....	37, 996
Needles, Crochet.....	J. M. Hoadley.....	39, 572
Needles, Knitting, Machine.....	T. Sands.....	38, 988
Needles, Knitting, Making.....	T. Sands.....	38, 987
Needles, Sewing Machine.....	J. Madden.....	37, 585
Needles, Threading.....	J. O'Kane.....	37, 587
Needles for sewing machines.....	F. H. Brown.....	38, 282
Needle Wrappers.....	O. H. Blood and F. C. Treadwell, jr.....	40, 205
Nets, Fishing, Adjustment of.....	W. Randolph.....	39, 676
Netting, Mosquito, Stretching and folding.....	J. A. and L. Van Riper.....	39, 868
News Distributor.....	J. H. Pratt.....	37, 590
Newspapers, &c., Printing the addresses on.....	J. A. Campbell.....	37, 432
Newspapers, &c., Printing the addresses on.....	D. Fuller.....	39, 913
Newspaper File.....	J. H. Atwater.....	40, 545
Nickel, copper, and cobalt, Separating.....	A. Monnier.....	40, 116
Night-soil, Treating, for agricultural purposes.	R. B. Fitts.....	39, 472
Nippers and pincers, Combined.....	D. Sweetman.....	40, 291

Invention or Discovery.	Name of Patentee.	No.
Nozzles	C. Oyston	39, 674
Nozzles, Hose	C. F. Macy and S. Martin	40, 847
Nozzles, Hose, Attaching revolving tips to	H. B. Morrison	39, 700
Numeral Frames	J. H. R. Reffelt	37, 825
Nuts, Bolts, &c., Manufacturing	J. Marsden	38, 116
Nuts, Making	P. Koch	38, 397
Nuts, Making	W. Chisholm	40, 606
Nuts, Making	O. C. Burdict	40, 815
Nuts and Washers, Making	I. Scoville	39, 590
Nut Cracker	T. Earle	40, 825
Nut Machine	L. Thomas	39, 506
O.		
Oat Separator	L. Patric	38, 630
Observatories and Signal Towers, Portable	E. Tanner	39, 689
Oil, &c., Ascertaining the amount of water, &c., in barrels of	G. Tazliabue	38, 427
Oil, &c., Case or Box for holding	S. Selden	39, 071
Oil, Coal, Apparatus for burning, for heating purposes	H. W. Dopp	37, 436
Oils, Coal, Distilling	J. L. Alberger	37, 798
Oils, &c., Drawing off and skimming	J. Peck and W. H. H. Glover	39, 169
Oils and Fats, Rendering	C. E. Gray	39, 565
Oils and Paraffine from peat and other substances, Distilling	S. L. Wiegand	39, 607
Oil and Spirits of Turpentine from pine wood, Producing	S. L. Cole	40, 737
Oil as fuel, Means of using Hydro-carbon	G. B. Hill	39, 918
Oil as a substitute for linseed oil, Preparing	A. Millochan	38, 641
Oil for burning and lubricating, Compound	W. G. Hermance	38, 825
Oil for burning and lubricating, Compound	R. A. Gilman	40, 924
Oil Caps for machinery	T. W. Godwin	40, 032
Oilcloth, Coating	M. Sawyer	40, 364
Oilcloth, Composition	R. Hoskin	40, 411
Oil Press Mats	H. Nutt	39, 671
Oil Stills	J. D. Smeadley	37, 709
Oil Stills	J. Reese	38, 602
Oil Stills	C. A. Hardy	40, 163
Oil Vapor, Condensing	J. W. Wetmore	39, 978
Oil Vessels	G. W. Banker	40, 230
Ointment, Mercurial, Nitrated	C. Learned	37, 697
Ordnance	J. C. C. Holensshade	38, 110
Ordnance, Adjustable porthole for directing	P. G. Peltz	38, 407
Ordnance, Breech-loading	J. Lee	38, 638
Ordnance, Breech-loading	A. B. Smith	39, 559
Ordnance, Breech-loading	E. A. Sutcliffe	39, 596
Ordnance, Breech-loading	R. B. Reynolds	40, 121
Ordnance, Breech-loading	G. I. Washburn	40, 205
Ordnance, Breech-loading	F. F. S. Von Cannstatt	40, 295
Ordnance, Chambered Trunnions for disabling	P. B. Lawson and A. Burney	37, 870
Ordnance, Construction of	N. Wiard	38, 709
Ordnance, Construction of	N. Wiard	39, 604
Ordnance, Discharging	W. Johnson	38, 683
Ordnance, Field, Mounting	W. F. Godwin	39, 914
Ordnance, Implements for disabling	A. Bonzano	37, 946
Ordnance, Mounting	B. H. Bartol	38, 089
Ordnance, Mounting	M. Stoddard	39, 687
Ordnance, Mounting and operating	J. Taggart	38, 266
Ordnance, Operating	E. A. Stevens	37, 364
Ordnance, Operating	M. L. Callender and N. W. Northrup	37, 935
Ordnance, Operating	M. Wappich	40, 067
Ordnance, Operating, on war vessels	W. P. Miller	38, 118
Ordnance, Repeating	E. C. C. Kellogg	40, 540
Ordnance, Rifling	T. Steece	37, 924

Invention or Discovery.	Name of Patentee.	No.
Ordnance, Rim Bases of, Finishing.....	E. F. Howard.....	40, 039
Ordnance, Serving.....	S. H. Coon.....	37, 279
Ordnance, Shield for.....	P. Andrew.....	40, 453
Ordnance, Submarine.....	J. Duffy.....	39, 801
Ordnance in boring mill, Apparatus for adjusting.	S. D. Dean.....	40, 824
Ores, Concentrating.....	J. Hepburn.....	40, 932
Ores, Furnaces for desulphurizing.....	L. G. Marshall.....	39, 786
Ores, Heating, for smelting furnaces.....	A. Royer.....	38, 419
Ores, Refining.....	J. L. Constable.....	39, 257
Ores, Separating and dressing.....	H. Trumbull.....	38, 773
Ores, Shaking Machine for separating.....	A. W. Schell.....	37, 888
Ores, Sulphur, Pyritous, and other, Treating..	M. W. Tinding.....	39, 684
Ores, Washing.....	P. Scheuerman.....	40, 950
Ores and amalgamating precious metals, Machine for grinding.	J. G. Prandall.....	40, 501
Ore Pulp, Collecting amalgam and mercury from.	Z. Wheeler.....	39, 251
Ore Washer.....	T. Wise.....	38, 016
Ore-washing Machines.....	J. Collom.....	38, 467
Ovens.....	P. J. Gindre and J. Doerler.....	39, 042
Ox Bows, Shaping wood for.....	H. S. Denison.....	40, 249
Ox-bow Fastenings.....	E. Renney.....	38, 395
Oysters, Steaming and shucking.....	I. Solomon.....	41, 026
Oyster Dredges, Hoisting.....	J. Whitecar.....	38, 436
P.		
Packing for pistons and other rods.....	J. Johnson.....	37, 663
Padlocks.....	C. Liebrich.....	39, 486
Paint, Composition for.....	P. Caubet.....	39, 020
Paint, Composition for.....	J. Miller.....	39, 202
Paints, Composition in preparing.....	E. M. Seabury.....	39, 204
Paint, Fire-proof.....	G. W. Powell.....	40, 429
Paints, Preparing hydro-carbon liquids to serve as vehicle for.....	A. Meucci.....	38, 714
Paint for ships' bottoms.....	J. G. Tarr and A. H. Wonson.....	40, 515
Paint Composition.....	E. F. Barnes.....	39, 000
Paint Oil.....	A. Millochan.....	38, 640
Paint Oil from petroleum, Preparing a.....	A. Millochan.....	37, 918
Painters' Panels.....	A. G. Collins.....	39, 632
Painting, Process for Graining and Ornamental.	W. J. Potter.....	38, 412
Palings, Lathes, &c., Sawing.....	S. Head.....	40, 690
Pans, Ash.....	J. A. Lawson.....	38, 902
Pans, Baking, Covers for.....	W. C. Davis.....	40, 461
Pans, Evaporating, Cellular or tubular boilers for.	D. M. Cook.....	37, 735
Pans, Evaporating, with cellular boilers.....	D. M. Cook.....	37, 736
Pans, Evaporating, for sorghum juice, &c....	N. Z. Potter.....	38, 839
Pans, Evaporating, for sugar juices.....	D. M. Cook.....	38, 152
Pans, Evaporating, with tubular boilers.....	D. M. Cook.....	37, 737
Pan, Gold Miner's Washing.....	T. Kendall, sr.....	37, 758
Pans, Sugar.....	A. T. Wilder.....	38, 998
Pans for backing electrotypes.....	W. A. Leggo.....	39, 410
Pans for evaporating sugar, &c.....	C. B. Darrow.....	40, 460
Panels, Painters'.....	A. G. Collins.....	39, 632
Pantaloons.....	H. Osler.....	39, 584
Pantaloons Straps.....	S. Heller.....	40, 931
Paper, &c., from the husks of Indian corn, Manufacture of.	A. Auer de Welsbach.....	38, 220
Paper, Cylinder moulds for making.....	J. T. Jones.....	38, 684
Paper, Folding.....	J. North.....	38, 874
Paper, Folding and Ruling.....	J. P. Herron.....	39, 045
Paper, Leather.....	S. M. Allen.....	39, 371
Paper, Leather, &c., Cutting ornaments in...	J. D. Mets.....	38, 402
Paper, Planishing.....	J. F. Schuyler.....	37, 790

Invention or Discovery.	Name of Patentee.	No.
Paper, Safety	J. P. Olier	38,835
Paper, Sand, Holding emery or	E. R. Barnes	40,231
Paper and Paper Boards, Making	J. T. Jones	40,265
Paper for collars, &c., Manufacture of	S. M. Allen	38,019
Paper to cutting machines, Device for feeding	J. F. Schuyler	37,791
Paper from sorghum, Manufacture of	H. Pemberton	38,059
Paper from wood, Manufacture of	S. M. Allen	38,020
Paper Bags, Making	J. Wells	40,001
Paper Bag Machine	J. J. Greenough	37,573
Paper Bag Machines	C. H. Morgan	37,726
Paper Bag Machine	J. Wells	38,253
Paper Bag Machine	S. E. Petlee	38,452
Paper Cards for hooks and eyes	De Grasse Fowler, jr	38,259
Paper Collars and other articles of apparel, Bending and folding.	J. F. Schuyler	37,792
Paper-drying Machines	N. W. Tayler and J. W. Brightman	38,993
Paper Feeders	E. Allen	39,872
Paper Files	W. L. Woods	38,868
Paper Files	S. Thompson	40,508
Paper-making Machinery	G. E. Rutledge	38,698
Paper-making Machines, Rag engine of	J. Faw	38,735
Paper-making Machines, Vacuum box of	J. L. Seaverns	39,500
Paper Pulp, Boiler for making	M. L. Keen	38,901
Paper Pulp, Manufacture of	A. H. Tait and W. H. Holbrook	40,728
Paper Shade Holders, Clasps for	G. Wederkind	37,990
Paper Shirt Collars	S. S. Gray	38,160
Paper Shirt Collars	A. A. Evans	38,664
Paper Stock, Preparing woody fibre for	G. E. Sellers	40,217
Paper Stock from wood, Manufacture of	P. A. Chadbourne	37,951
Paraffine and Oils from peat and other sub- stances, Distilling.	S. L. Wiegand	29,607
Parer, Apple	E. L. Pratt	40,185
Parer, Apple	E. Manley	40,640
Paste, Dough, &c., Making	E. Stevens	40,370
Patterns for moulding pipes	G. Ross	37,981
Pavements, cement, tiles, pipes, building- blocks, &c., Composition for forming.	J. Marsh, jr., and G. Marsh	38,833
Pavements, &c., Composition for	P. Harder	38,582
Paving or Flag Stone, Asphaltic	A. and I. Straub	40,651
Pawl and Ratchet	G. G. Taylor	40,086
Peat and other substances, Distilling oils and paraffine from.	S. L. Wiegand	39,607
Pedomotive, Infants'	E. J. Gorham	39,392
Pegging boots and shoes, Machines for	J. H. Brown	40,306
Pegging boots and shoes, Machines for	W. Miller	40,351
Pegging Machines, Shoe	W. G. Budlong	38,463
Peg Float	C. H. Odell	41,015
Pens	A. F. Warren	39,084
Pen, Fountain	J. Weller	40,135
Pen and Pencil Case	J. J. Lownds	40,846
Pen and Pencil Case	J. H. Ranch	40,855
Pen Rack and Inkstand	S. Walker	37,313
Pencils, Lead	J. Reckendorfer	37,360
Pencil, Lead, Cutter head for wood of	F. G. Jenkins	38,488
Pencils, Lead, Making wooden cases for	A. Weiller	39,019
Pencil and Pen Case	J. J. Lownds	40,846
Pencil and Pen Cases	J. H. Ranch	40,855
Pencil and Sponge Holder for cleaning slates, &c.	J. L. Rowe	39,704
Pencil Sharpeners, Slate	J. M. Hicks	40,102
Pessaries	H. V. Scattergood	40,949
Petroleum, &c., Deodorizing	J. W. W. Tindall	38,069
Petroleum, Naphtha, &c., Deodorizing	R. N. Warfield	40,068
Petroleum, &c., Stills for	C. Lockhart and J. Gracie	40,632
Petroleum and other hydro-carbons, Apparatus for generating gas from.	G. W. Thompson and J. Foster	38,429

Invention or Discovery.	Name of Patentee.	No.
Petroleum and other liquid fuel for the generation of steam and other purposes, Process of burning.	D. Dick.....	38,732
Petroleum residuum, Preparing a paint oil from the.	A. Millochan.....	37,918
Photographic Camera.....	J. Stock.....	39,432
Photographic Card Mounts.....	S. Wing.....	40,302
Photographic Gallery, Portable.....	S. Weaver.....	40,970
Photographic Printing Frame.....	M. Witt.....	39,191
Photographs, Coloring.....	J. F. Brodtker.....	38,144
Photographs, &c., Composition for coloring and water-proofing.	W. F. Spieler.....	38,847
Photographs, &c., Pasting and mounting.....	M. Ormsbee.....	39,166
Photograph Holder.....	J. E. Treat.....	38,849
Piano-fortes.....	W. Bourne.....	37,717
Piano-fortes.....	D. Decker.....	38,731
Piano-fortes.....	L. Matt.....	39,664
Piano-fortes, String bearing for.....	R. A. Tooker.....	40,384
Piano-fortes, Tuning attachment for.....	R. Beebe.....	40,015
Piano-forte Action.....	T. C. Faulder.....	37,860
Piano-forte Legs.....	A. Goodman and L. Hale.....	40,166
Pianos, Scale for.....	S. Winner.....	41,043
Pick, Mill.....	L. M. Osborn.....	40,183
Picks, Mill.....	G. M. Rhoades.....	38,603
Pick, Mining.....	C. Hoffman.....	38,481
Picks or Axes.....	A. Moore.....	37,970
Pictures, Mirrors, &c., Manufacture of wooden mouldings or strips for the frames of.	R. J. Marcher.....	38,314
Pike and Revolving Fire-arm.....	J. C. Campbell.....	39,032
Piles, Driving.....	J. Dubois.....	38,570
Pillows, Mattresses, &c., Stuffing for.....	A. C. Crondal.....	40,024
Pilot, Revolving.....	E. and A. Wyckoff.....	38,622
Pins, Rolling.....	J. F. Heissenbuttel.....	39,916
Pins or Wrists, &c., Turning cross-head.....	W. S. Phelps.....	38,060
Pincers and Nippers, Combined.....	D. Sweetman.....	40,291
Pipes, Blow.....	J. S. Hull.....	39,398
Pipes, Blow, Gas.....	A. H. Wood.....	40,376
Pipes, Cement, Making.....	J. Howarth.....	39,233
Pipes, cement, tiles, pavements, building-blocks, &c., Composition for forming.	J. Marsh, jr., and G. Marsh.....	38,833
Pipes, Conduit.....	W. S. Sampson.....	37,828
Pipes, Joint for.....	H. E. Towle.....	39,081
Pipes, Lead, Composition for lining, and other purposes.	T. Hodgson.....	39,615
Pipes, Lead, Lining with tin.....	W. A. Shaw.....	37,877
Pipe, Lead, Protecting against the action of water.	L. Brandies.....	40,904
Pipes, Metallic, Combination cement, &c.....	H. Knight.....	38,112
Pipes, Moulding, Pattern for.....	G. Ross.....	37,981
Pipe, Moulding and casting.....	B. S. Benson.....	37,670
Pipes, Tobacco.....	C. Chinnock.....	38,883
Pipes, Tobacco.....	H. Bradford.....	39,987
Pipes, Tobacco.....	F. Fickey, jr.....	40,536
Pipes, Tobacco smoking.....	H. Kurth.....	39,819
Pipes, Tobacco smoking.....	F. Fickey, jr.....	40,880
Pipes, Tubes, &c., Manufacture of.....	B. Rhodes.....	37,377
Pipes, &c., Water, Composition for.....	J. S. Chatham.....	37,494
Pipes, Water, Manufacture of, from bitumen, pitch, &c.	F. Baschnazel.....	38,649
Pipes, Water, Preventing obstructions in.....	T. D. Bond.....	38,138
Pipes and Manifolds, Arrangement of conducting.	C. C. Walworth.....	38,433
Pipe and other boxes, Fitting.....	W. Thurber.....	40,779
Pipe Drainer.....	A. Brigham.....	38,371
Pipe Joints, Gas.....	R. C. Robbins.....	37,425

Invention or Discovery.	Name of Patentee.	No.
Pistol Holster	A. A. Bennett	38, 213
Piston, Engine	T. S. Dwelley	38, 474
Pistons for Steam Engines	H. D. Dunbar	38, 890
Pistons for Steam Engines	B. F. Hedden	39, 397
Pistons for Steam Engines	N. P. Stevens	39, 431
Pistons for Steam Engines	F. H. Furnis and J. Hovey	40, 559
Pitchforks, Horse	S. Raymond	40, 709
Pitmans	F. Graham	37, 473
Plaiting Machines	G. C. Nelson	40, 424
Planes, Bench	S. C. Howes	37, 694
Plane, Edge, for trimming soles of boots, &c.	J. Brooks and J. H. Sanford	38, 026
Planes for bending moulding, &c.	S. C. Howes	40, 483
Planing Machine	L. Doolittle	39, 037
Planing Machine, Pressure blocks for	J. Lawrence	39, 996
Planing Machine, Rotary cutter for	D. McKinley	38, 712
Plants, Hand lights for protecting	O. R. L. and M. P. A. Crozier	38, 656
Plants, Separating the fibre from tropical.	E. Juanes Y Patrullo	38, 330
Plants for useful purposes, Preparation of the roots of.	J. N. Kalzemnayer	40, 143
Plant Fenders	P. Barber	39, 333
Plant Protectors	J. Weed	40, 873
Planters, Corn	H. Cassidy	37, 564
Planters, Corn	C. W. S. Heaton	37, 754
Planters, Corn	W. S. Todd	37, 834
Planters, Corn	J. B. Ryder	38, 244

Seats, &c., Railroad, Composition for dyeing the covers of.	A. A. Grandelle	39,199
Seat and Cane	C. H. Daecomb	40,823
Seat and Desk, School	J. Monteith	40,117
Seat and Desk, School	D. I. Stagg	40,289
Seeders	C. E. Miller	37,354
Seeding Machines	W. Finley	37,286
Seeding Machines	H. Thomason	37,311
Seeding Machines	P. McGlew	37,353
Seeding Machines	C. E. Steller	37,465
Seeding Machines	J. H. Thomas and P. P. Mast	37,712
Seeding Machines	G. D. Haworth	37,753
Seeding Machines	U. H. Shockley	37,776
Seeding Machine	N. E. Allen	38,528
Sieves, Wooden, for gas purifiers	R. G. Hunt	40,264
Separator and Smut Machine, Combined	J. Routh	38,128
Separator and Threshers	W. W. Durgee & A. B. Farquhar	38,379
Sewage, &c., Apparatus for	W. Atkinson	38,544
Sewing Machines	W. O. Grover	37,502
Sewing Machine	N. Jones	37,580
Sewing Machine	G. L. Dunlaney	37,617
Sewing Machine	J. G. Hollowell	37,624
Sewing Machines	A. B. Howe	37,913

Invention or Discovery.	Name of Patentee.	No.

Sewing Machine Stitch.....	C. F. Bosworth.....	38,806
Shades, Lamp or gas.....	M. J. Wellman.....	39,438
Shade, Window, Hanging.....	E. T. Higham.....	39,319
Shades for lamps, Incombustible paper.....	G. Wedekind.....	38,523
Shade Fixture, Window.....	E. T. Briggs.....	38,555
Shade Rack.....	W. Webster.....	38,205
Shade and Chimney for lamps and other lights.....	M. J. Wellman and J. J. Greenough.....	40,785
Shafts, Counter.....	C. G. Shaw.....	37,525
Shaft Bearings.....	J. B. Francis.....	39,562
Shafting, Centring, Device for.....	F. B. Williams.....	39,608
Shafting, Vertical, Bearing for.....	J. Platt.....	39,830
Shaves, Spoke.....	M. Tuell.....	40,437
Shavings for upholsterers, Planing.....	S. A. & W. H. Post.....	39,747
Shears.....	R. Heinisch.....	37,689
Shears, Sheep.....	G. F. Johnson.....	40,170
Shears, Tailors'.....	H. Wendt.....	39,693
Shears for clipping horses.....	S. H. Folsom.....	38,576

Invention or Discovery.	Name of Patentee.	No.
Shears and Scissors	J. Bryant	40,010
Shears, Moulds for casting	S. Ray	38,912
Sheep, Stock for shearing	R. Gregg	39,566
Sheep Racks	J. P. Eaton	37,905
Shells, Bomb, Manufacturing	A. Pevey	39,354
Shells, Composition for filling	L. Short	38,424
Shells, Explosive	W. Maginn	40,054
Shells, Explosive	H. Halverson	40,538
Shells, Explosive, Composition for	J. P. Perry	39,746
Shells, Explosive, Discharging, from balloons	C. Perley	37,771
Shells, Explosive, for ordnance	H. Resley	37,520
Shells, Explosive, for ordnance	T. Harding	39,254
Shells, Explosive, Percussion apparatus for	J. J. Schillinger	37,830
Shells, Explosive, Percussion fuze for	J. W. Cochran	37,275
Shells, Explosive, Removable charge chamber for	F. Alger	39,267
Shells, Incendiary	L. Wood	38,441
Shell, Incendiary	C. W. Stafford	40,198
Shells, Moulds for casting	A. J. Eddy	37,388
Shells, Percussion exploder for	J. M. Connel	37,566
Shell and Shot, Grinding and smoothing	J. Williams	40,386
Shelves, Revolving	S. Vernoy and N. Overfield	37,780
Shield for infantry and artillery, Portable	M. Saviers	38,845
Shields or Covers, Cooking-stove	H. W. De Puy	39,555
Shingles, Barrel Heads, &c., Sawing	J. B. Dougherty	37,885
Shingle, Jointing, Machine for	J. F. Parks	40,274
Shingles, Planing, Machine for	J. R. Cluxton	39,380
Shingles, Punching and pressing	P. Dexter	38,036
Shingle Machine	S. J. Parker	38,329
Shingle Machine	S. Heywood	39,046
Shingle Machines	J. Beaudreau	39,110
Shingle Machine	A. H. Clark	39,272
Shingle Machine	S. Head	41,039
Shingle Machine	M. Weaver	40,969
Shingles and Staves, Sawing	G. H. Parsons	38,932
Ships, Ram for the destruction of the enemy's	C. Perley	37,769
Ships-of-war	J. Wheatley	39,601
Ships-of-war, Construction of	A. Walker	39,708
Ships-of-war and other batteries for defence against projectiles, Construction of	S. Gibbons	37,620
Ship's Anchor, Cat-block for freeing a	G. W. Duncan	38,356
Ships' Bottoms, &c., Protecting	J. Brown	40,672
Ship Building	W. H. Degges	38,294
Ships' Rigging, Means of setting up	S. Smith and W. H. Fludder	38,919
Ships' Water-closets	P. W. Neefus	37,635
Ships' and other batteries, Armor-plates for	B. T. Babbitt	37,380
Ships' and other batteries, Defensive armor for	G. B. Manly	37,402
Shirts	A. Drey	40,026
Shirt Bosoms	J. A. Pease	40,426
Shirt Bosoms, Folding the plaits in	F. M. Chandler	37,952
Shirt Stud and Sleeve Button	H. Simon	37,777
Shoes, Arranging nails for use in machines for nailing	O. Gilmore	37,909
Shoes, belts, &c., Clasp for	E. S. Winchester	38,009
Shoes, Device for inserting the gores of	J. M. Hunter	38,168
Shoes, Nailing Machine for	J. H. Brown	40,880
Shoes, Water-proof	T. C. Waies	37,416
Shoes for replacing cars, Rolling	W. L. Gilroy	38,671
Shoe Fastening	E. C. Harrington	39,144
Shoestrings, Pointing Tags of	J. Hill	38,309
Shoestrings, Tagged Braid for	J. Hill	38,164
Shoes and Boots, Improvement in	D. N. B. Coffin, jr	38,373
Shoes and Gaiters, Patterns for Cutting	E. Shopbell	37,527
Shot, Chain	G. B. Ganster	39,282
Shot, Hot, Compound sabot for	L. P. Jenks	39,930

Invention or Discovery.	Name of Patentee.	No.
Shot and Shell, Grinding and smoothing.....	J. Williams.....	40, 386
Shovels, Lifting.....	W. E. Davis.....	40, 398
Shutters for the portholes of iron-clad vessels..	B. H. Bartol.....	38, 088
Shutter Fastenings.....	A. Hyde.....	37, 625
Shutter Fastenings.....	T. J. Townsend.....	40, 868
Shutter Fastenings.....	G. D. Whitmore.....	40, 972
Shutters and Show Windows, Securing.....	T. Becker.....	37, 849
Shuttles, Sewing Machine.....	T. J. Halligan.....	39, 567
Side-saddle Trees.....	W. Hill.....	40, 691
Sieve, Boxed.....	J. O. Durgin and J. A. Walker.....	38, 953
Sieves, Grain.....	J. Capell.....	40, 242
Sifters, Coal.....	R. C. Nichols.....	39, 668
Sifters, Coal.....	W. W. Stevens.....	40, 449
Sighting Small-Arms.....	A. T. Garretson.....	40, 256
Signal Apparatus for Railways.....	E. Vincenzi.....	40, 373
Signal Code for Rockets.....	G. H. Felt.....	40, 744
Signal Towers and Observatories, Portable...	E. Tanner.....	39, 689
Silicates, Alkaline, Manufacture of.....	T. Elkinton.....	39, 135
Silicates, and the manufacture of hydro-fluo- silicic acid, Treatment of metallic.	T. Cobleigh.....	38, 285
Silver and Gold, Amalgamating.....	Z. Wheeler.....	40, 874
Sinks.....	S. N. Maxam.....	37, 354
Skates.....	J. L. Plimpton.....	37, 305
Skates.....	G. W. Ansley.....	37, 428
Skates.....	B. Irving.....	37, 447
Skates.....	J. M. Yates.....	37, 934
Skates.....	C. H. Marvin.....	38, 173
Skates.....	C. O. Luce.....	38, 591
Skate.....	A. W. Johnson.....	38, 829
Skates.....	J. J. McCormick.....	38, 907
Skates.....	M. Huyzel and M. Modig.....	39, 013
Skates.....	L. F. Johnson.....	39, 149
Skates.....	J. F. Schneider.....	39, 247
Skates.....	J. Lyon.....	39, 938
Skates.....	W. Bailey.....	40, 807
Skates.....	M. Feurstein.....	40, 921
Skates, Fastening for.....	C. T. Day.....	39, 468
Skates, Means of attaching.....	J. Forbes.....	40, 745
Skates, Skeleton.....	H. Wilson.....	40, 530
Skate Fastening.....	G. Weber.....	38, 133
Skate Fastenings.....	F. Douglas.....	39, 800
Skate Fastening.....	W. H. Dutton.....	40, 093
Skate Fastening.....	J. Hewett.....	40, 211
Skate Fastening.....	C. T. Day.....	40, 916
Skates and Fastenings.....	C. V. Ramsdell.....	38, 983
Skins and Hides, Liquid Composition for Bating.	R. Wager.....	38, 267
Skirts, Claspings.....	S. R. Wilmot.....	37, 992
Skirts, Claspings hoops to ladies'.....	D. M. Smith.....	37, 711
Skirts, Hoop.....	J. Mann and A. McDonald.....	38, 832
Skirts, Hoop.....	D. Hawkins.....	39, 396
Skirts, Hoop.....	L. S. Schofield.....	40, 285
Skirts, Hoop.....	C. Newman.....	40, 355
Skirts, Hoop.....	L. Sanders.....	40, 363
Skirts, Hoop.....	S. S. Sherwood.....	40, 985
Skirts, Hooped.....	C. H. De Forest.....	37, 336
Skirts, Hooped.....	S. S. Sherwood.....	37, 374
Skirts, Hoop, Frames for forming.....	J. F. J. Gunning.....	38, 821
Skirt Supporters.....	N. Wiard and H. Shlarbaum.....	38, 437
Skirt Supporters, Corset.....	L. H. Foy.....	39, 910
Skirt Supporters, Corset.....	L. H. Foy.....	39, 911
Slates, &c., Pencil and Sponge Holder for cleaning.	J. L. Rowe.....	39, 704
Slate Surface, Black-boards, &c., Composi- tion for.	J. N. Peirce.....	37, 639
Sleds.....	S. E. Oviatt.....	40, 425

Invention or Discovery.	Name of Patentee.	No.
Sleds, Boys'	N. C. Sanford	40, 065
Sleighs	D. P. Fales	38, 954
Sleighs, Connecting shafts or thills to	J. C. Walter	37, 651
Slide, Photographic Printing Frame and	M. Ormsbee	38, 326
Slinging Accoutrements, Mode of	W. D. Mann	40, 849
Smoke-stack	H. R. Gillingham	39, 727
Smoke-stacks for Locomotive Engines	C. P. Noble	39, 493
Smut Machines	R. M. Phenix	39, 774
Smut Machines	I. Phillips	40, 639
Smut Machine and Separator, Combined	J. Routh	38, 128
Snow and Ice from Railroads, Removing	M. C. Bogia	37, 897
Soap	D. B. Chapman	37, 471
Soaps, Colors, &c., Stirring and mixing	H. Hungerford	38, 167
Soap, Composition for	E. E. Lee	38, 685
Soap, Dies for forming bars of	T. Worsley and G. W. Dorsey	39, 784
Soap, Pressing	J. H. Keller	40, 627
Soap, Silicated, Manufacture of	D. B. Chapman	38, 354
Socket for Hanger Bars	T. A. Summers	41, 027
Soda and Potash, Preparing hydrated silicates of	J. M. Ordway	38, 449
Soda-water, Drawing	W. Lee	38, 577
Soda-water Apparatus	J. D. Lynde	40, 347
Soda-water Apparatus	J. H. Blaisdell	40, 811
Soda-water Cooler	A. D. Puffer	39, 587
Soda-water Fountain	D. and T. Williams	39, 086
Soda-water Fountain	S. R. Sylvester	39, 331
Soda-water Fountain	M. W. Warne	39, 976
Soda-water Fountain	T. Ogden and J. Hinderyer	40, 496
Sofa Bedstead	F. C. Payne	38, 978
Sofa Bedstead	T. J. Magee	39, 863
Sofa Bedstead	T. J. Magee	40, 848
Soldering sheet-metal cans	H. Miller	39, 616
Soles, Boot and Shoe	C. Goodyear, jr	37, 287
Soles, Inner	D. Bowker	39, 713
Sole Cutting Machines	S. S. Weed	39, 437
Sorghum Juice and Sirup, Refining	J. F. Sheldon	40, 544
Sorghum Sirup, Refining	J. F. Sheldon	40, 953
Sorghum Wine	A. Myers	37, 424
Soundings, Instruments for taking	J. Ericsson	40, 028
Sounding Apparatus, Automatic	H. M. Naglee	39, 161
Sowers, Seed and Manure, Broadcast	N. Foster	37, 393
Sowing Machines, Grain	J. Bergstresser	37, 430
Spade, Fork, Hoe, and Rake, Combined	T. Goodrem	39, 012
Spading Machines, Rotary	W. Wadsworth	39, 975
Spark Arrester	J. Hovey	38, 111
Spark Extinguishers for Locomotives	P. H. Corlett	39, 552
Spatting Machine	M. Wilcox	38, 075
Spectacles	J. Jennings	38, 262
Spike Machine	A. Warth	38, 634
Spikes, Making Railroad, Boat, and other	M. Foster	38, 818
Spikes from guns, Removing	A. Lafever	40, 051
Spikes and bolts, Drawing	J. C. Chapman	37, 332
Spindles, Lubricating of	J. Eaton	40, 678
Spindles of Spinning Machines	J. Eaton	39, 557
Spinners, Driving Power for	M. G. Hubbard and A. J. Smith	37, 757
Spinning Frame, Ring	W. Jenckes	39, 657
Spinning Machines, Flyers of	O. Pearl	37, 702
Spinning Machines, Flyers for	D. Hussey	40, 069
Spinning Machines, Self-lubricating Bolsters for	M. P. Wilmarth	39, 190
Spinning Machines, Spindle Bolsters of	R. Fethney	40, 980
Splints, Surgical	T. H. Currie	38, 034
Spokes, Machine for Tenoning	H. M. Preston	37, 842
Spoke Machine	E. K. Wisell	37, 859
Spoke Shaves	M. Tuell	40, 457

Invention or Discovery.	Name of Patentee.	No.
Sponge and Pencil-holder for Cleaning Slates, &c.	J. L. Rowe.....	39,704
Spools or Bobbins.....	B. Saunders.....	39,681
Spoons, Iron, Tinned.....	R. B. Perkins.....	37,373
Spouts for Conveying Sap.....	M. Sheldon and W. A. Chase.....	39,072
Springs, Balls, &c., Manufacture of.....	A. R. Davis.....	38,813
Springs, Buffer, for Railroad Cars.....	A. H. Rowand.....	40,122

Springs, Carriage.....	C. B. Galentine.....	39,224
Springs, Carriage.....	G. Woerber.....	40,787
Spring, Door.....	W. T. Root.....	39,308
Springs, Door and Shutter.....	L. Bonner.....	38,023
Springs, Elliptic.....	R. Vose.....	38,432
Springs, Elliptic, Confining the ends of.....	R. Vose.....	40,968
Springs, Rubber.....	S. J. Seely.....	38,245
Springs, Vehicle.....	E. C. Brooks.....	40,603
Springs for Carriages.....	W. Wharton.....	37,653
Spring for Furniture.....	C. F. and J. W. Tillman.....	40,963
Springs for Motive Power, Combining.....	G. Terry.....	40,866
Spring for Railroad Cars, Bumpers and Draw-head.	J. C. Jackson.....	37,448
Springs for Railroad Cars, Draw.....	R. A. Wilder.....	38,618
Spring and Fastener, Window.....	G. W. Tillston.....	39,762
Spurs.....	T. Townsend.....	37,880
Spurs, Riding.....	A. H. Langhols.....	39,106
Spurs for Horsemen's use.....	T. Garrick.....	39,477
Square and Plumb Level.....	D. G. Davison, E. Pullen, and J. S. Davison.	39,124
Stair Rails, Bracket Brace for.....	E. Betts.....	39,875
Stair Rod Fastening.....	E. A. Goodes.....	40,339
Stalls, Floors for.....	Z. G. Garlick.....	39,283
Stalls, Releasing animals from.....	W. Kloenne.....	40,416
Stamp, Hand.....	G. McClemment.....	38,315
Stamp, Hand.....	G. J. Hill.....	38,535
Stamps, Hand.....	H. Holt.....	38,864
Stamps, Hand.....	V. Beaumont.....	40,074
Stamp, Pie.....	H. Marshall.....	37,761
Stamp, Postage, Cancelling.....	W. Rayner.....	40,430
Stamps, Postage, Preserving.....	J. P. Herron.....	39,147
Stamps, Postage and other, Cancelling.....	S. W. Francis.....	38,222
Stamps, Post Office.....	M. P. Norton.....	38,175
Stamp, Self-inking.....	J. D. Billings.....	37,884
Stamp, Self-inking, Hand.....	S. J. Hoggson.....	38,043
Stamps, &c., Wetting.....	B. W. Sackett.....	38,503
Stamp Cancellor.....	R. H. Rogers.....	40,857
Stamp and Currency Box.....	L. L. Tower.....	39,184
Stamp and Pencil Eraser.....	E. Faber.....	38,892
Stamping and Drilling, Machine for.....	J. W. Towle.....	39,768
Starch, Manufacture of.....	T. Kingsford.....	40,693
Staves, Chuck for Turning.....	F. Robbins.....	39,173
Staves, Jointing.....	P. Welch.....	40,784
Stave Cutting Machine.....	P. Welch.....	40,783

Invention or Discovery.	Name of Patentee.	No.
Stave Dressing Machine.....	E. Holmes.....	37,720
Stave Dressing Machine.....	L. D., L. C., and A. M. Benson..	39,711
Stave Machine.....	T. Hanvey.....	39,649
Stave Making Machines.....	Alvy T., John B., and S. Barnes..	40,596
Staves and Shingles, Sawing.....	G. H. Parsons.....	38,932
Stay and Jib Connexion.....	J. E. Seavey.....	37,476
Steam, Exhaust, Method of Utilizing.....	T. T. Prosser.....	40,083
Steam for heating purposes, Method of using exhaust.	B. T. Babbitt.....	38,021
Steam-Engine.....	J. B. Root.....	39,957
Steam and hydro-carbons, Carburetting gas from.	W. H. Gwynne.....	39,342
Steam and Water power, Combination of.....	A. Huffer.....	37,344
Steamers, Culinary.....	L. F. Noe.....	38,239
Steel, Manufacture of.....	C. Atwood.....	38,140
Steel, Manufacture of.....	J. C. Schernman.....	38,504
Steel, Manufacture of.....	W. Gerhardt.....	40,470
Steel, Manufacture of.....	W. H. Brunt and J. W. McElroy..	40,732
Steel, Manufacture of Malleable Iron and.....	E. B. Wilson.....	39,364
Steel, Welding, Composition for.....	A. Briggs.....	38,554
Steel and Iron, Process of Uniting Copper, Brass, &c.	R. Savary.....	39,531
Steel and Iron, Purifying.....	W. Gerhardt.....	40,472
Steel and Iron, Purifying, by means of blasts of air.	G. W. Sweet.....	39,078
Steering Apparatus.....	S. Gwynn.....	37,503
Steering Apparatus.....	A. Smith.....	37,710
Steering Apparatus.....	C. Perley.....	37,768
Steering Apparatus.....	J. F. Rochon.....	39,752
Steering Apparatus, Propelling.....	R. H. Lecky.....	39,936
Steering Apparatus, Steam.....	C. S. Morrison.....	37,517
Stencil Plates.....	S. C. Sumner.....	37,648
Stereoscopes.....	C. H. Wheeler and J. A. Basin..	40,798
Stereoscopic Apparatus.....	S. D. Goodale.....	40,794
Stereoscopic Instrument.....	E. G. Chormann.....	38,196
Stereoscopic Instrument.....	E. G. Chormann.....	38,197
Still's.....	H. Clements.....	38,729
Still's for Petroleum, &c.....	C. Lockhart and J. Gracie.....	40,632

Varnish, Water-proof, for paper, cloth, &c.....	J. H. Greene.....	39,095
Varnish for making printer's ink and for other purposes.....	D. Steinert.....	39,968
Varnish for pictures.....	J. McKillop.....	38,690
Vault covers.....	E. S. Boynton.....	38,941
Vault glasses, Tool for inserting putty beneath.....	F. Smith.....	37,422
Vegetables, Desiccating.....	W. K. Lewis.....	38,753
Vegetable substance for the separation of fibres, &c., Disintegration of.....	G. E. Sellers.....	40,576
Vehicles, Attaching breeching to thills of.....	La Roy N. Leslie and T. Richardson.....	39,736
Vehicles, &c., Locomotive horses for.....	P. W. Mackenzie.....	39,349
Vehicles, Wheel.....	G. S. Manning.....	39,297
Vehicles, Wheel.....	H. C. Drew.....	40,025
Vehicles, Wheel.....	C. J. Preston.....	40,944
Veneers, Cutting.....	H. Parker and C. W. Hawkes.....	39,352
Veneer-cutting Machine.....	G. Gardner.....	40,402
Ventilating apparatus for wounded limbs.....	T. C. Ball.....	39,453
Ventilating and illuminating risers, Mode of.....	M. J. McCormick.....	38,788
Ventilators.....	T. T. Prosser.....	37,772
Ventilators.....	F. D. Chase.....	38,946
Ventilators, Car, Railroad.....	S. Merrick.....	38,691
Ventilators, Car, Railroad.....	J. L. Howard.....	39,925
Ventilators, Car, Railroad.....	A. B. Spencer.....	40,199
Ventilators, Window.....	G. W. Otis.....	38,327
Ventilators for buildings.....	J. Leeds.....	39,937
Ventilators for shop windows.....	H. A. Gouge.....	38,675
Vents and Faucets.....	J. Jahraus.....	40,044
Vessels, Construction and defence of war.....	E. A. Stevens.....	37,411
Vessels, Cover for preserving.....	I. Stratton.....	37,595
Vessels, Deck-lights for.....	J. Sutton and J. Gregory.....	38,342
Vessels, Discharge of bilge water, and for the ventilation of.....	J. Briggs.....	40,394
Vessels, Iron-clad.....	L. Tees.....	38,771
Vessels, Iron-clad, Shutters for the port-holes of.....	B. H. Bartol.....	38,088
Vessels, Iron, Coppering.....	W. B. Barnard.....	37,998
Vessels, Iron-plated and other, Preserving.....	J. P. Jouvin.....	39,576
Vessels, Launching.....	G. F. Rowland.....	38,418
Vessels, Masts for navigable.....	C. P. Coles.....	38,151
Vessels, Means for speed in the propulsion of.....	J. F. Reigart.....	39,067
Vessels, Mode of raising sunken.....	P. E. Falcon.....	37,438
Vessels, Propulsion of.....	J. Briggs.....	40,393
Vessels, Raising sunken.....	F. Kettler.....	37,401
Vessels, Raising sunken.....	W. K. Fairbank.....	39,895
Vessels, Skid for discharging and loading.....	R. Bragg.....	39,211

Invention or Discovery.	Name of Patentee.	No.
Vessels, War.....	J. L. Jurgens.....	39,408
Vessels, War, Construction of.....	P. Andrew.....	39,788
Vessels, War, Construction and defence of.....	O. Tufts.....	38,014
Vessels, War, Port closer for.....	W. S. Auchincloss.....	40,895
Vessels, War, Port stopper for.....	J. Ericsson.....	40,830
Vessels, Water propulsion of.....	J. Watt.....	38,522
Vessels, and fruit jars, Closing.....	J. Harbster.....	39,441
Vessels and jars, Manufacturing enamelled fruit.....	H. Reed.....	37,591
Vices.....	N. Allen.....	38,273
Vices.....	P. Wright.....	38,621
Vice, Parallel.....	N. P. Otis.....	38,405
Vulcanizing Machine.....	E. A. L. Roberts.....	37,523
W.		
Wagons.....	L. M. Ham and J. H. Dodge.....	39,345
Wagons, Attaching hubs to.....	A. E. Smith.....	39,177
Wagons, Carriages, &c., Constructing.....	J. Kirkman.....	40,758
Wagons, Dumping.....	R. W. Green.....	39,478
Wagons, Holdbacks for.....	J. McNamee.....	39,260
Wagon for transporting medicines.....	J. Dunton.....	37,955
Wagon for transporting medicines.....	T. M. Perot.....	39,951
Wagon Bodies.....	N. B. Cooper.....	37,855
Wagon Standards.....	O. E. Miles.....	40,422
Waiter, Table, or tray.....	N. Waterman.....	38,519
Wardrobe.....	E. Durand.....	38,473

LETTER
FROM THE
COMMISSIONER OF PATENTS,
TRANSMITTING

His annual report for the year 1863.

MARCH 23, 1864.—Laid on the table and ordered to be printed.

UNITED STATES PATENT OFFICE,
Washington, D. C., January 30, 1864.

SIR: I have the honor herewith to transmit the annual report of this office for the year 1863, to be laid before Congress.

I am, very respectfully, your obedient servant,

D. P. HOLLOWAY,
Commissioner of Patents.

Hon. SCHUYLER COLFAX,
Speaker of the House of Representatives, Washington, D. C.

UNITED STATES PATENT OFFICE,
January 30, 1864.

SIR: In obedience to the requirement of the fourteenth section of the act of March 3, 1837, entitled "An act in addition to an act to promote the progress of science and the useful arts," I have the honor to submit a report of the operations of this office during the year 1863.

The receipts and expenses of the office for the past year, together with the present condition of the patent fund, will be seen by reference to the following statements:

No. 1.

Number of applications made during the year 1863.....	6,014
Number of patents granted, including reissues and designs.....	4,170
Number of caveats filed during the year.....	787
Number of applications for extension of patents.....	40
Number of patents extended.....	48
Number of patents expired 31st December, 1863.....	968

Of the patents granted, there were to—

Citizens of the United States.....	4, 048
Subjects of Great Britain.....	58
Subjects of French Empire.....	37
Subjects of other foreign governments.....	27
	<hr/> 4, 170

No. 2.

Statement of money received during the year 1863.

On applications for patents, reissues, &c.....	\$178, 617 00
For copies and for recording assignments.....	16, 976 29
	<hr/> 195, 593 29
	<hr/>

No. 3.

Statement of expenditures from the patent fund.

For salaries.....	\$89, 559 94
For contingent expenses.....	42, 715 29
For temporary clerks.....	54, 438 41
For withdrawals.....	1, 680 00
For refunding money paid by mistake.....	720 50
For judges in appeal cases.....	300 00
	<hr/> 189, 414 14
	<hr/>

No. 4.

Statement of the patent fund.

Amount to the credit of the patent fund January 1, 1863.....	\$38, 361 15
Amount paid in during the year.....	195, 593 29
	<hr/>
Total.....	233, 954 44
Deduct amount of expenditures during the year.....	189, 414 14
	<hr/>
Leaving to the credit of the patent fund January 1, 1864, the sum of	44, 540 30
	<hr/>

Table exhibiting the business of the office for twenty-seven years, ending December 31, 1863.

Years.	Applications filed.	Caveats filed.	Patents issued.	Cash received.	Cash expended.
1837			435	\$29,289 08	\$33,506 98
1838			520	42,123 54	37,402 10
1839			425	37,260 00	34,543 51
1840	765	228	473	38,056 51	39,020 67
1841	847	312	495	40,413 01	52,666 87

1863	6,014	787	4,170	195,593 29	189,414 14

The law requiring the Commissioner of Patents to communicate to Congress an annual report, contemplates that in addition to statistical statements and tables, such as have been above given, he should present his reflections upon the working of the laws he is called upon to administer, and exhibit a view of the progress of the arts of the country, which it is his peculiar privilege to observe. In discharging this duty, I shall take the liberty of departing from the formality of a mere official communication, and address myself through Congress, by whose munificence the reports of this office are so widely disseminated, to the public, for whose benefit they are mainly intended.

The subjects to which I shall call attention are, the policy of any system of protection by patents; the advantages of our own system as compared with those of other leading industrial nations, and particularly Great Britain; the state of the industrial arts in this country as exhibited by the inventions examined in this office within the last one or two years; and the modifications of patent laws which, in my judgment, would give greater efficiency to our present system.

POLICY OF PROTECTION BY PATENTS.

I am aware that to most inventors in this country it would seem not less preposterous to question the right of property, or the fundamental laws of morality, than to inquire into the right and policy of granting patents for inventions; but we cannot shut our eyes to the fact that within the last few years the policy of patent laws has been the subject of grave discussion in Europe. No later than 1862, a distinguished member of the House of Commons in England gave notice of a motion to consider, not the working, but the policy, of the patent law itself; and in a debate which arose in May, 1862, upon a motion of Sir Hugh Cairnes for an address to the crown, praying for the appointment of a commission to inquire into the working of the law relating to patents for inventions, members of Parliament stated that year by year the opinion had grown more general that, practically, patents did more harm than good to inventors. In 1852 a select committee of the House of Lords was appointed to consider a bill pro-

posed to amend the then existing law of patents. The voluminous evidence taken before this committee has been published, and is full of instruction as to the working of the patent laws in Great Britain, and the questions which arose as to the policy of those laws. The character of the questions which were raised as to the policy of any patent system, is exhibited by some of the interrogatories proposed by the committee :

“Do you not think that the fact of a patent being granted is a considerable obstruction to anybody else inventing in that line?”

“You think that in no case where a useful improvement in the course of a manufacture suggests itself to the mind of a man, he would be deterred from making that improvement for fear of being dragged into litigation by reason of his infringing some other patent?”

“Do not you think that the stimulus which a patent gives to a man withdraws a great many ingenious artisans from their usual and more useful work in order to invent things which, when invented, are of no use whatever?”

A question put to Mr. Brunel, an engineer of acknowledged eminence, is, “The result of your evidence is, that you are very decidedly of opinion that the whole patent system should be abolished?”

His answer is, “Yes; I think it would be an immense benefit to that unfortunate class of men whom we call inventors, who are at present ruined and their families ruined, and who I believe are a great injury to society.”

“And you think that those consequences, such as ruin to inventor, and evils of that description, would subsist equally, though the patent laws were made simple and effective?”

“Yes, I think they would be very much increased; and if patents are continued, I hope the principle will be carried out thoroughly, and then it will not stand for two years.”

“I can see every day that the poorer class of inventors ruin themselves by the attempt to work out some idea for the sake of getting a patent, while, in all probability, if the man had gone to his master and said, ‘Well, it strikes me, that by such a means we should be able to get through more work and do something better; what do you think about it?’ the chances are that most masters would, if they saw it was a good idea, give the man £1 or a £5 note; and the man the next day would be at work at something else, and you would have out of that man’s brains an immensely greater portion of invention, and I believe he would get much better paid for it. I believe he would really make money; whereas, now, everybody acquainted with these men knows that they lose money by it, and that an inventor, a schemer, is a poor man, who is more likely to go to the work-house than anything else.”

Mr. J. L. Ricardo, a member of the House of Commons, in his answers to the questions of the committee, forced the free-trade doctrines of his eminent namesake to the utmost verge. He says, “the result of my experience and observation has been a conviction that the whole system of granting patents at all is very injurious to the community generally, and certainly not of any advantage whatever to the inventor. I consider that it is in a great measure a delusion upon the inventor to suppose that the patent privileges which are granted to him render his invention more valuable than it would be, supposing there did not exist any monopoly with regard to it.” He regards a monopoly with respect to a particular trade as being in exactly the same situation as a monopoly respecting any particular invention. “The object of a patent is to monopolize a particular trade.” He quotes Mr. Say, who considers a patent as a recompense which the government grants to the inventor at the expense of the consumer. He quotes the opinion of Lord Kenyon, in the case of *Hornblower against Bolton*, in which he says: “I confess I am not one of those who greatly favor patents; for although in many instances, and particularly in this, the public are greatly favored by

them; yet, on striking the balance on the subject, I think that great oppression is practiced on inferior mechanics by those who are more opulent." He does not refer to the views of Lord Mansfield, the great founder of commercial law, who held that "in all work of the mind and of genius, the common law of England ought to be held as giving an absolute property." He refers to Lord Bacon, who, in his advice to Sir George Villiers, says: "Especial care must be taken that monopolies, which are the canker of all trading, be not admitted under the specious pretext of public good." But he makes no mention of the tribute to inventive genius which Lord Bacon proposes in his Atlantis, where he says: "Upon every invention of value we erect a statue to the inventor, and give him a liberal and honorable reward."

The objectors to the policy of a system of protection by patents, as appears by the questions propounded by the committee of the House of Lords, and the answers above quoted, may be resolved into three classes:

1. Those who honestly doubt whether the system of patents affects the assumed development of the industrial resources of the nation; 2, those who believe that the progress of a nation is to be secured only through the encouragement and instrumentality of the favored classes; and, 3, those who, carrying the abstract principles of free trade to too great a generalization, deny the policy of any law which savors of a monopoly, or effects even a temporary protection of industry or genius. The objections of the first class I will hereafter attempt to answer in detail. Those of the second class not openly favored under the present political condition of affairs in this country, have found sympathy with a class now, happily, perhaps, removed from us, who always regarded with contempt the poor inventors of the north. It is this spirit which breathes in the language of the eminent engineer, who conceives that the poor inventor would be sufficiently rewarded by receiving a one-pound or five-pound note from his master. It is unnecessary to reply seriously to this class of objectors. They can be found only in a country where the avowed objects of the laws which regulate the descent of property are the concentration of wealth in the hands of the few and the support of hereditary aristocracy; where the husbandmen on small properties have been driven from the land, in order that 2,000 proprietors may possess among them one-third of the land and the total revenue of the three kingdoms where the doctrines of political economy prevail that large farms, large machine shops, large cotton mills, and large iron works, can produce cheaper than small ones, and therefore may very properly supersede and obliterate them; and where a theologian no less respected than Dr. Chalmers can be found to affirm of the blessings of a splendid aristocracy, "that from this higher galaxy of rank and fortune there are droppings, as it were, of a bland and benignant influence on the general platform of humanity."

There is unfortunately, in this country more sympathy with the last class of objectors, no regard, with Mr. Ricardo, a patent obnoxious as a remnant of the old abuse of monopolies, by which an individual obtained from the Crown the exclusive right to exercise some particular trade, and who consider the patent laws as a product of the semi-barbarous age of Queen Elizabeth. During her reign the sole right to buy and provide steel within her realm was granted to a single nobleman. The sale of salt, starch, leather, paper, &c., was restricted to favored persons, who in some cases raised the prices 1,000 per cent. and upwards. It was this class of monopolies against which Lord Bacon inveighed. The evils of this policy increased to such an extent, that it was considered by the Parliament of James I altogether incompatible with the prosperity of the country. His feeling produced, in the 21st of James I, the famous "statute of monopolies"—famous not only for the abolition of the former unjust monopolies of trade, but for establishing the rights of inventors, which date, according to Blackstone and other English jurists, from that law. The statute suppresses monopolies by making void the future grants of all such as do not come under

the following proviso: "Provided also, and be it enacted, that any declaration before mentioned shall not extend to any letters patent and grants of privileges for the term of fourteen years or under, hereafter to be made, of the sole working and making of any manner of new manufacture within the realm, to the true and first inventor or inventors of such manufacture, which others at the time of making such letters patent shall not use, so as also they be not contrary to law, nor mischievous to the State, by raising the prices of commodities at home, or hurtful of trade, or generally inconvenient." Certain patents, more of the character of the ancient monopolies of trading, which paid a yearly rent to the exchequer, were exempted from the operation of the statute. The date of the act was 1624. In 1639, great discontent having arisen in the public mind with respect to the monopolies and privileges which remained, there was issued a proclamation abolishing a great many of the privileges which still existed, and among others "all patents for new inventions not put in practice from the date of their respective grants." There was thus in the general statute abolishing monopolies, and the subsequent proclamation clearing away such as subsisted, a distinct recognition of the claims of *useful* inventions to exemption.

It is a curious fact in the general history of the origin of the patent policy, that the original object in granting patent privileges in France, as stated by M. Wolowski, professor of commercial legislation, in the evidence before the committee of the House of Lords, was to break up the monopoly of the guilds of trade which formerly existed in France, as well as in almost every city in Europe. All the persons practicing any one art or trade in a particular city, such as the tailors, the brewers, the tanners, the goldsmiths, &c., were united into a company, which received from the government the exclusive right to practice their vocation. The competition of the art or trade was thus restricted to those who had been made free of the company; and no person could be made free until he had complied with regulations, often intentionally made numerous and vexatious in order to prevent too many persons entering the business. No member of the guild could work except in conformity with its rules. An inventor of any improvement in the trades practiced by the guild, not a member thereof, could not employ his own invention; a patent gave the inventor the right of working individually, in derogation of the chartered monopoly of the guild. According to M. Wolowski, patents are now granted in Austria for the same object. Thus the dawn of the rights of inventors has been actually coeval with the destruction of monopolies, odious to the common justice of man. And the common sense of mankind has marked a distinction between such monopolies and the exclusive rights conceded to inventors. Their rights under patents are called monopolies only, from the poverty of language, which has failed to express in words a distinction which no less clearly exists.

The odious monopolies, or those properly so called, such as were given in the time of Elizabeth for the sale of salt, starch, paper, steel, &c., were grants simply to aid individuals in amassing wealth, and favored the aggregation of property in a few hands without opening new sources of national wealth, and were thus in derogation of the rights of others without compensatory public benefit, and were therefore positively injurious. Prof. Bowen has shown, in opposition to dogmas of Adam Smith, that individual and national wealth are not identical; that individuals grow rich by the acquisition of wealth previously existing; nations, by the creation of wealth that did not previously exist. "Invention," says Mr. Ray, according to Prof. Bowen, "is the only power on earth that can be said to create. It enters as an essential element into the process of the increase of national wealth, because that process is a creation, and not an acquisition. It does not necessarily enter into the process of the increase of individual wealth, because that may be simply an acquisition, not a creation." "Hence," continues Mr. Bowen, "the most frequent cause of the increase of national wealth is the increase of the skill, dexterity and judgment, and of the mechanic contrivances, with which national labor is applied." In this view, how can a monopoly of a

trade be compared with the exclusive right in an invention? How can the exclusive privilege to sell salt in Elizabeth's time, which added not one bushel to the production, but which enriched the monopolist and robbed the community, as was the fact by raising the price from sixteen pence a bushel to fifteen shillings, and the exclusive right of Whitney to his invention of the cotton gin, which has added hundreds of millions to the products and exports of the country, be both branded, with equal justice, with the odious name of monopoly?

The argument of the distinguished member of Parliament, Mr. Ricardo, against patents, on the ground of their being monopolies, may have less weight when the immediate practical grounds of his objections are considered. It appears from his evidence before the committee that he was chairman of the Electric Telegraph Company—the great company which, under Mr. Wheatstone's patents and a charter from Parliament, exclusively controlled the system of telegraphic communication in England. This company paid for the patent rights under Mr. Wheatstone the sum of £140,000, and that the company had paid nearly £200,000 in buying patents and litigating them; that the company had bought up a very large number of patents which interfered with their exclusive rights, because they had made it a rule, if a man offered reasonable terms, to buy an invention, however bad it might be, sooner than litigate it; and that they paid for one patent—that of Mr. Bains—£8,000 or £9,000, which, although it did not quite come up to the expectation of the company, they found useful in combination with other patents. The obvious question occurs, how, but for the existence of the patent laws which recognized the rights of the company to the exclusive use of Mr. Wheatstone's and Mr. Bains's patents, for which they had paid the inventor a full equivalent, could they have had the means of reimbursing themselves for the vast expenditure for the original and competing patents? What more instructive illustration could be found, except the whole free-trade policy of Great Britain, of the fallacy of political economy founded simply upon the individual interests of men and nations?

It is gratifying to observe that Mr. J. S. Mill, admitted to be the ablest living writer upon political economy, and a strong advocate of free trade, thus frankly admits the reasonableness of granting patent rights: "The condemnation of monopolies," he says, "ought not to extend to patents, by which the originator of a new process is permitted to enjoy, for a limited period, the exclusive privilege of using his own improvement. This is not making the commodity dearer for his benefit, but merely postponing a part of the increased cheapness which the public owe to the inventor, in order to compensate and reward him for the service. That he ought to be both compensated and rewarded for it will not be denied; and also, that if all were at once allowed to avail themselves of his ingenuity, without having shared the labors or the expenses which he had to incur in bringing his idea into a practical shape, either such expenses and labors would be undergone by nobody, except by very opulent and very public-spirited persons, or the state must put a value on the service rendered by the inventor, and make him a public grant. This has been done in some instances, (as when Parliament offered a reward of £20,000 for a method of finding a ship's longitude at sea,) and may be done without inconvenience, in cases of very conspicuous public benefit; but, in general, an exclusive privilege of temporary duration is preferable, because it leaves nothing to any one's discretion; because the reward conferred by it depends upon the invention's being found useful, and the greater the usefulness the greater the reward; and because it is paid by the very persons to whom the service is rendered, the consumers of the commodity."—Political Economy, vol. II, page 497.

I now recur to the first and most important question, whether the patent policy has actually increased the industrial resources of nations.

It is grateful to refer to the testimony upon this point, given before the committee before referred to, by intelligent practical men, thoroughly familiar with the operation of the patent laws and the condition of the arts in Great Britain. Mr. Carpmael, a patent agent of great experience, in reply to the question, "Are you of opinion that the present patent law might be safely repealed altogether, and inventions deprived of all privilege of protection?" replies, "I can only say that I can see no inducement to an inventor to come forward to benefit the manufacturers of the country, unless you give him some reward. Looking through the history of the whole of the manufactures of this country, you will find that all the steps have been founded upon patents, from the earliest date up to the present time. Take any branch, whether it be the cotton manufacture, the steam engine, the manufacture of flax or wool—in the case of every one, if we trace the history of it through, which I should be happy to do if it were necessary, it will be seen that the whole system is based upon patents. Paper-making is the same, and so in every branch that I remember." Being asked, "Can you, without difficulty, point out a certain number of very important inventions, which were preceded by such costly experiments that they could not have been carried out without the patent law?" Mr. Carpmael says: "Watt, in the case of the steam engine, was seven years before he got the first engine to work efficiently. In the case of Arkwright's machine for spinning cotton, he was several years before he got efficiently to work. In the case of Crompton, the same; in the case of Hargraves, the same. Then, in regard to combing wool by machinery, and the first power-loom by Cartwright, he did not succeed in getting practically to work for many years, and he was rewarded by Parliament for what he had done, because he had not been remunerated in the working of his patent. The paper machine was worked out by a series of costly experiments, which never would have been entered upon but for the patent laws of the country. In this manner might I go through all our manufactures; indeed, in no instance has any manufacture grown into importance in this country, except by a series of costly experiments, and costly machinery, carried on for many years, in the hope of deriving benefit through grant of letters patent."

Mr. Webster, the well-known writer on patent laws, stated before the committee: "I am quite sure of this, that if any person who may be disposed to think that patents should be done away with, comes to examine the way in which particular manufactures have been built up by reason of the large amount of capital which has been thrown into them, in reliance upon the action to be obtained by means of the protection given for a short time, he will be very much surprised. In some of the most successful inventions of the present time, it will be found that the first patent effected little; but, in attempting to work this out, further improvements were made, and fresh patents obtained, so that by the protection which has been given to different stages of the invention, and the quantity of capital which has been laid out upon it, the invention has been perfected and introduced, and made useful to the public in a time within which it never could have been done but for the money which has been employed upon it, in reliance upon the protection of the patent. The whole of our experience of cases before the privy council is proof of that, and leads to the conclusion that many inventions would never have been introduced at all without such protection; and no man, so far as my knowledge of manufactures goes, would have ventured upon those experiments had it not been from some such inducement as the reward offered by the patent law."

Mr. Bennett Woodcroft, the accomplished Superintendent of the Great Seal Patent Office in England, under the Commissioners of Patents, to whom more than any other person is due the publication of the specifications and drawings illustrative of all the patents granted in England since 1617—a work which may be justly regarded as one of the proudest monuments of British genius—

has added to the many obligations conferred upon this office by presenting to it, within the last year, a series of engravings executed in the highest style of art. Their subjects can be best described in his own words: "Actuated by a sincere respect for mechanical genius, and a warm admiration of its productions, I have collected all the known portraits, eight in number, of the *ten mechanicians* whose inventions laid the foundation, raised the superstructure, and now secure the continuance of the cotton manufacture, the most marvellous for its extent and effects that ever employed the ingenuity of man."

Mr. Woodcroft, in a memoir which he has published containing brief biographies of these ten inventors of machines for the manufacture of textile fabrics, observes that in looking at the progress and magnitude of the cotton manufacture, surprise is excited at the simple construction of the few machines which have produced such wonderful results, "at the lateness of their revelation and their tardy adoption." And he appositely applies to those works the words of Milton:

Th' invention all admired, and each how he
To be th' inventor missed; so easy it seemed,
Once found, which, yet unfound, most would have thought impossible.

The ten mechanicians to whose inventions the results produced in the cotton manufacture are by Mr. Woodcroft mainly attributed, are—Kay, who was inspired to run the shuttle on pulleys, and impel it by a short lever attached to a string, by which one weaver was enabled to do the work of two or three; Paul, who taught a method of spinning a hundred or more threads at once; Arkwright, who reinvented and revived roller spinning; Hargraves, who invented the jenny, which drew sixty or seventy threads at once; Crompton, who invented the *mule*, (so called because it combined Paul's and Hargraves's inventions;) Radcliffe, the author of the improvement in sizing or dressing the whole of the warp before it was wound upon the beam, thus removing the grand difficulty then existing in the art of weaving; Cartwright, who brought forth a loom which would weave cloth by a mechanical, instead of a manual, motor, and thus quadruple the power of the weaver; Jacquard, who invented the apparatus to which his name is given for selecting the warp threads, which superseded the services of the draw-boy at the loom; Roberts, who made the mule of Crompton automatic, or self-acting; and Heilmann, who, from observing his daughters comb their hair, conceived the machine for combing cotton and wool, ever since in universal adoption.

Mr. Woodcroft thus states the result in Great Britain alone, produced mainly, as he considers, by these ten inventions. In 1760, at the accession of George III, the entire value of cotton goods manufactured in England was about £200,000 a year. In 1772 British calicoes were made to the number of 50,000 pieces. In 1816 upwards of 1,000,000 pieces were manufactured. In 1750 the population engaged in the cotton manufacture was about 20,000. In 1801 the persons engaged were about 80,000. In 1823 there were 10,000 steam-looms in Great Britain. In 1862 their number was 399,992, driven with a power of 294,000 horses, and employing 451,000 work-people in 2,887 factories, containing 30,387,457 spindles. Every one of the ten inventions which have produced these marvellous results was protected by patents; each inventor was stimulated by the reward which this protection opened to his hope, if not his fruition, and, without the prospect of appropriating to himself wealth and honor, would have shrunk from the labors of creating and introducing his invention. Granting, as is quite probable, that the individual importance of these men, in relation to the cotton manufacture, is somewhat exaggerated, and that the credit given to them should be shared with the eight hundred men who have taken out patents for improvements in this manufacture, it is no less true that the whole system of the manufacture of cotton in Great Britain is founded upon patents.

Illustrations, less striking, it may be, but not less convincing, of the beneficial

influences of the protection afforded by patents, can be found in the history of the industrial arts in this country. I will point to a totally different branch of manufacture which had its undoubted origin, and has attained its perfection, in the United States—the manufacture of India-rubber goods. The facts are obtained from records in this office and reports of committees in Congress. India-rubber was introduced into France in 1776. Dr. Priestley says that, in 1791, he saw a specimen of the gum at a stationer's, where it was used to erase pencil-marks—hence its name. In 1823 five hundred pairs of shoes, made by the natives in South America directly from the exudations of the gum-bearing tree, were imported into this country, and sold at Boston. In the years 1832, 1833, 1835, and 1836, several manufactories were established in New England for making India-rubber goods. Upon their introduction into market it was found that the goods became clammy and sticky when exposed to heat, and were stiffened by the cold. They were therefore useless. In consequence of these defects, in 1839 all the companies and individuals engaged in the manufacture were ruined. The manufacture was utterly prostrated.

At this time a simple workman in Connecticut, named Hayward, who had undertaken to carry on this manufacture by himself, who, to use his own words, hired the shop he worked in, and whose only income from the uncertain profits of his business was about five hundred dollars a year, sought day and night to discover some substance which might be combined with the India-rubber and cure its defects. Absorbed in the search of what to him was the philosopher's stone, "he dreamed at night," as he asserts, that the desired solvent was sulphur. He combined the rubber with sulphur, and, to his delight, discovered that the defects in the goods were almost wholly overcome. He had miraculously, as it were, discovered a substance which combined chemically with the rubber, making, in fact, a sulphuret of rubber—indeed, a new substance, whose structure is fibrous like horn, whereas the structure of rubber alone is granular, or molecular. He obtained a patent for his discovery; but being heavily in debt, and perhaps unable to conceive of the vast consequences which would result from his invention, he sold the right to his invention for a mere pittance to Mr. Goodyear. The latter experimented upon the new compound discovered by Hayward, and discovered the art of vulcanizing it.

This invention is thus described by Mr. Webster, in his great speech at Trenton: "The great peculiarity of this vulcanizing process is this: If you take a compound of sulphur and rubber in a dry state and grind and mix them together, and apply heat, the consequence is, that the substance softens and softens as the degree of heat increases, until it reaches a certain height in the thermometer, say 212° Farenheit and along there, a little more or less. Well, anybody," says Mr. Webster, "who ever tried the effect, to see what would be the operation upon this compound, and finding that it ran up to a great degree of heat, softening and rendering it more and more plastic as the degree of heat was augmented, would naturally be of the opinion that if the heat was carried still higher the whole substance would melt. But Mr. Goodyear, as the result of untiring experiment, found out that, although the application of heat produced a melting effect upon this compound, rendering it more and more plastic and soft as the degree of heat augmented, yet when the heat, going on, had got up to a certain much higher degree, its effect was the reverse of what it had been, and then the rubber composition commenced to vulcanize and harden, and in fact to make metallic the vegetable substance." The result of the two inventions is thus stated by Mr. Webster: "It introduces quite a new material into the manufacture of the arts, that material being nothing less than elastic metal. It is hard like metal, and elastic as pure original gum-elastic. Why, this is as great and momentous a phenomenon occurring to men in the progress of their knowledge, as it would be for a man to show that iron and gold could remain iron and gold, and yet become elastic like India-rubber."

Mr. Goodyear obtained a patent for his discovery, and granted licenses to manufacture under his and Hayward's patents. The manufacture at once revived. Twenty years afterwards the yearly sale of goods created by these inventions in the city of Boston alone was set down at \$2,500,000. Thousands of operatives are employed in their manufacture. The uses to which the vulcanized rubber is applied are innumerable, and new uses are discovered every day. Water-proof shoes, clothing, tents, pontoons, blankets for soldiers—invaluable as they have been proved in our service, preventing the loss of thousands of lives, and promoting the health and comfort of the soldier to a degree beyond estimation—buckets, life-preservers, mail bags, car springs, suspenders, pencil cases, combs, boxes, are only a few of the countless articles made, specimens of which may be seen in the beautiful collection deposited by Mr. Goodyear in the saloons of this office. There is probably not a family in the country that does not use these goods, and there is hardly an instance on record in which inventions have within so short a period become so essential to general comfort and convenience.

It is unnecessary to say that this great manufacture was founded upon the stimulus which the patent privilege gave to the inventors, and the protection which the patents have given to the manufacturers.

I have spoken of the great spinners and weavers who have carried the cotton manufacture to its great perfection in Great Britain. An invention in the class of textile manufactures has been made by an American, which equals in ingenuity anything which has been accomplished in Great Britain or France. The history of the invention proves that it would not have been introduced without the protection which the patent afforded, and there is precise evidence on record of the saving in money which it has effected for the consumers of the country. Previous to 1842 all three-ply and ingrain carpets were woven in hand looms, the motive power being furnished by the weaver. Numerous and costly experiments to weave ingrain carpets by power-looms had been made in England, but had proved unsuccessful. Mr. Erastus P. Bigelow, of Massachusetts, in 1842, conceived of a series of devices for making the carpet loom automatic, so that the costly labor of men might be dispensed with, and the whole process of weaving might be conducted by girls and boys. After laying his plans before many manufacturers, without obtaining their approval, he succeeded in engaging the attention of the treasurer of a manufacturing company in Lowell, who had the intelligence to see the importance of the undertaking, and to understand the grounds of its probable success. Through him he made an engagement with "the Lowell Company," which, in consideration of the exclusive right to use all his inventions then or afterwards made, so far as they could be applied to the weaving of ingrain carpets, agreed to pay the expenses of putting a trial loom in operation, and if that proved successful, to build a power-loom mill, and to pay Mr. Bigelow a certain patent rent per yard upon all carpeting woven during the existence of the patents which Mr. Bigelow was to take out for his inventions. The trial loom proved successful, and the company proceeded to erect mills to manufacture carpeting under Mr. Bigelow's patents. The cost of these works was many hundred thousand dollars, the fixed capital of the company in their carpet works being \$978,956. This vast outlay was made, and in fact the whole improvement was based, upon the protection given by the exclusive right under the patents. The invention was of such a character that it could be developed, tested, perfected, and made practically useful only by the expenditure of a vast capital. The only security for this outlay, which no individual could have made, was the protection of the patent. The company were careful to secure the right to all future improvements which the inventor might make. Encouraged by the certain though moderate reward offered by his arrangement with the company, the inventor continued for four years after the first loom was devised to add new improvements, which were protected by five more patents; and it now presents a machine which is admitted to be unsurpassed by anything

which the mechanical genius of man has ever devised. The benefits which this invention has conferred upon the manufacturing company, the inventor, and the public, are precisely shown by records in this office. The "Lowell Company" granted to the "Hartford Carpet Company" a license to use these inventions, the use being confined to these two companies. The profit in the carpet department, in the Lowell Manufacturing Company, from October 31, 1859, to April 30, 1863, was \$687,801 41. The total dividends of the Hartford Carpet Company from January, 1855, to July, 1863, were \$1,009,649 50. The par value of the stock, \$100 per share. The market value, \$155 to \$160 per share. The total receipts of the inventor from his royalty have been \$50,432 12.

The benefit to the public by this invention is, first, the production of superior goods, the texture of the power-loom carpeting being more uniform, the selvage more even, and the matching of the figures more perfect. The actual saving to consumers is thus calculated: Prior to the introduction of the power-loom, the Lowell Manufacturing Company paid, as wages for weaving by the hand-loom the description of carpeting known as two-ply, $11\frac{3}{4}$ cents per yard, and for three-ply 25 cents per yard; whereas, with Bigelow's power-loom, they only pay for weaving the former article $2\frac{57}{100}$ cents per yard, and for the latter $2\frac{83}{100}$ cents per yard; thus showing a saving by the power-loom in wages paid for weaving of $9\frac{18}{100}$ cents per yard for two-ply, and $22\frac{17}{100}$ cents per yard for three-ply, being an average of $15\frac{67}{100}$ cents per yard. But the saving in wages is partly neutralized by the more costly repairs of the power-loom machinery, and interest on the larger investment of capital required therefor, so that the average net saving by the power-loom is estimated at ten cents per yard. Accurate returns from the mills of the Lowell and Hartford companies up to April, 1863, show that the number of yards of carpeting woven upon looms was 25,964,185 yards; thus the saving to the people by this invention has been two million five hundred thousand dollars. That the saving in the price of manufacture of carpets has accrued to the consumers is evident from the fact that at the time Mr. Bigelow's invention was introduced the wholesale price of the best quality of two-ply carpeting was from eighty-five to ninety cents per yard, and of three-ply from one dollar and thirty to one dollar and thirty-three cents per yard; whereas, in 1860, the former description of goods, power-loom wrought, of a better quality than the hand-loom wrought, sold for from seventy to seventy-two and a half cents per yard, and the latter from ninety-five to ninety-seven and a half cents per yard, making an average reduction of over twenty per cent. It is worthy of observation that the ingrain carpets are used not so much by the wealthy as the middle classes. They give comfort and attractiveness to the homes of the people, and thus this invention, originated and introduced by the patent policy, has had a sensible effect in ameliorating and refining society.

Another class of inventions benefit the community, not by diminishing the price of goods for which there is already a public demand, as in the case just cited, but by producing and introducing labor-saving contrivances which the people must be *taught* to appreciate and use. Such are the inventions of labor-saving agricultural implements, which within the last twenty years have aided so materially in developing the resources of the country. The inventors and manufacturers of these machines, although prompted by a selfish but at the same time intelligent interest, have been more truly and effectually the instructors of the people than all the agricultural colleges in the land. The protection which the patent affords, is not only the cause in a majority of instances of an invention being made, but it is positively the cause why it is introduced and received. Losing sight of this practical truth, the government of Canada prohibited Americans from obtaining patents in that province mainly for the reason that they could obtain the benefit of our inventions without paying for them. The result has been, that, as it was for no one's interest to instruct the Canadians in the new mechanical arts of agriculture, they have plodded along with

the old tools, and have been benefited by none of the inventions which have stimulated the agriculture of the neighboring States.

In this country, in consequence of the protection which the patent laws afford, the inventors have found a ready sale of good inventions to capitalists and manufacturers who possessed the capital required to put the inventions into practical form. It is to those manufacturers that the introduction of the seed-ing, harvesting, and mowing machines, threshers, cultivators, &c., is immediately due. With a single eye to commercial results, they sent their agents through the rich agricultural districts, principally of the west, to exhibit the new machines and teach their operation. The agents convinced the farmers that the saving in the gathering of one year's crop would reimburse the cost of the machines, and readily made sales upon the understanding that the notes given in payment for the purchase should be paid out of the proceeds of the crop gathered by their use. The unparalleled rapidity with which the labor-saving machinery of the farm has been introduced throughout the west, in contrast with the proverbial slowness of the farmers of former times in adopting new improvements, must be attributed to the system I have just described.

We can hardly overestimate the benefit which the country has derived from these inventions, whose origin and introduction can be so clearly traced to the stimulus and protection by patents.

It is stated by Mr. Kennedy, in the census report for 1860, that a threshing machine in Ohio, worked by three men, with some assistance from the farm hands, did the work of seventy flails; and that thirty steam threshers only were required to prepare for market the wheat crop of two counties in Ohio, which would have required the labor of forty thousand men. It is estimated that a single reaping machine effects the saving of the labor of five men. With a good reaping machine ten men will cut, bind, and stack and house from ten to twelve acres per day, or two hundred acres in a single season—a task which would have required, without machines, the labor of fifteen men for its accomplishment. From reliable returns, in possession of this office, it is shown that forty thousand reapers have been manufactured and sold within the last year; and it is estimated by the manufacturers that over ninety thousand will be required to meet the demand for the next year. They will effect the saving of the labor of 450,000 men. The quantity of wheat grown in all the States and Territories in the year 1849 was 100,485,944 bushels. The quantity grown in 1859 was 171,183,381 bushels—an increase of nearly seventy per cent., or about double the increase of population in the same period.

It has been remarked that just before the commencement of the present war there was throughout the whole north, from no apparent cause, but, as it seemed, by an inspiration of Providence, a revival of a military enthusiasm which had slumbered for years. Without any concert, military organizations sprang up in every northern State, and at the sound of the first gun at Sumter, regiments, fully armed and equipped, were ready to rush to the capital. It is no less remarkable that the inventive genius of the nation within the last few years had taken a direction which has prepared the nation for the enormous demands upon her men and treasures. In consequence of this influence, the productive energy of the country has not been slackened, yet a million of men could be spared to fight our battles. And thus to each call from our great leader, the people have been able to respond—

“We are coming, Father Abraham,
Six hundred thousand more!”

The war, instead of checking, has stimulated our creative power in every branch of industry.

Within the last year there have been patented 240 inventions in implements of war, but during that period there have been patented 490 inventions of agricultural implements. And although the happy time foretold by prophecy

has not yet come, when the nation shall know war no more, the sword and the spear still yield to the ploughshare and pruning hook, and the arts of peace hold supremacy over the arts of war.

JUSTIFICATION OF THE UNITED STATES PATENT SYSTEM.

The next question which I propose to discuss, is the comparison of our own system of patents with those of the great industrial nations. Our patent system is founded mainly upon the statute of 1836, framed under the advice of the most experienced lawyers of the period, but carried through by the energy and wisdom of a distinguished senator of Maine, Mr. Ruggles, who deserves the grateful acknowledgments of the country for securing the passage of an act which has proved one of the most beneficial in our legislative history. The characteristic feature of our patent policy is the system of examination as to the novelty of inventions conducted by the Commissioner of Patents through an examining corps, selected for their special accomplishment in the arts which it is their duty to examine. No system of examination like our own exists in Europe, except to a very limited extent. I have before me a synopsis of the patent laws of nearly all the countries in Europe. In Great Britain, France, Austria, Belgium, Spain, the Roman States, Sardinia, and the Sicilies and Saxony, there is no examination as to novelty. In Prussia, Russia, the Netherlands, Hanover, and Bavaria, there is an examination by learned societies and commercial boards, instituted mainly for other purposes, but the whole number of patents granted in the last-named countries in 1858 was only 173; while in the first-named countries, in the same year, there were issued 10,297 patents. So that, considering the number of patents issued, our own peculiar system stands comparatively alone among those of all civilized nations.

Before proceeding to a consideration of our own system, I will state the principal features of the present patent law in Great Britain, which are of more interest to American inventors than those of any other country. These are well stated in a sensible speech made by Sir Hugh Cairnes, in the House of Commons, in May, 1862, whose language I shall use, with some abbreviations. The act of 1852 completely altered the system of patents which had previously prevailed. In the first place, before 1852 there was no means by which a person, who supposed he had arrived at an invention, could obtain temporary protection during the time that he was endeavoring to perfect it by experiments; and while making the experiments, there was the danger of their publication, and thus preventing the obtaining of any patent at all. In 1852 the legislature provided that, upon an inventor lodging a description of his invention, he should have a provisional protection for six months. The second change was in reference to the publication of specifications. Up to 1852 the specifications were kept in writing in certain very obscure offices in London, and were virtually inaccessible to the manufacturers of the kingdom. The act of 1852 provided that all specifications should be printed and sold at a moderate price. A mode of payment entirely novel was originated in 1852. An inventor suing for a patent pays £5 on lodging the provisional specification, and he pays nothing more for six months; at the end of six months, if he wishes to obtain a grant, he pays a sum of £20, and he pays nothing more for three years; during the three years he is able to consider whether the patent is worth any further outlay, and if so, a payment of £50 carries him on for seven years; during the seven years he has the opportunity of considering again whether the patent is worth any further outlay; and if at the end of that time he wishes to be further protected for fourteen years he has to make a final payment of £100; the total payment is, therefore, £175. And it is held that the payment being made by instalments, and increasing only as the profits of the invention might be supposed to increase, it is hardly irksome in any degree to the patentee—a view, I may remark, by no means supported by others in England who have discussed this feature of the

present law. The honorable member inquires what had been the consequence of the change of the law in the increase of the number of patents, and the results of his inquiries remarkably illustrate the benefits of a liberal legislation. Twenty years before the act was passed in 1833 the number of patents was 108. In 1851, the year before the alteration of the laws, the number of patents was 455. In 1852-'53, after the new act came into operation, the number of provisional protections for inventions was 3,260, out of which 2,050 patents were actually sealed.

These changes, although far from realizing the demands of the inventors of Great Britain, were vast improvements upon the laws existing previous to that time. Under the old law the process of an application for a patent, as stated in the London Quarterly Review, was required to pass through no less than nine stages and seven distinct offices situated in different places. Indeed, the object of sending the application through one of these offices was openly stated in the statute of Henry VIII, c. 11, "that the clerks should not by any manner of means be defeated of any part or portion of their fees." If the letters patent were required to extend to Scotland and Ireland, as well as to England, all the proceedings had to be gone through separately in each of the three cases. Thus the same patent may be said to have run the gauntlet of twenty-one offices. So heavy were the fees, applied not to the expenses of the patent offices, but mainly to swell the emoluments of the lord chancellor, attorney general, and other high officers, that the cost of a patent for the United Kingdom could not be estimated at less than £350, while the attendant expenses of preparing the specification, &c., often doubled the amount. It cannot be wondered that Mr. Dickins's poor inventor was forced to complain: "Is it reasonable to make a man feel as if, in inventing an ingenious improvement meant to do good, he has done something wrong? How else can a man feel when he is met with such difficulties at every turn? All inventors taking out a patent *must feel so*. And look at the expense. How hard on me, and how hard on the country, if there is any merit in me, (and my invention is took up now, I am thankful to say, and doing well,) to put me to all that expense before I can move a finger!"

Under the present, as well as the old laws, the only investigation which alleged inventions undergo before patents are granted is conducted by the law officers of the crown. They never inquire into the novelty of the invention. All that they do is to see that the alleged inventor describes in a clear and intelligible manner what he claims as his invention, so that he may not add to or take from it.

The system of granting patents in Great Britain without previous examination as to novelty has led to the granting of a great number of patents for the same thing—an evil which became so great as to lead to the publication of all the specifications, which only partially remedies the evil. Mr. Woodcroft says, "that having found so great an abuse to exist, as to granting patents for the same thing over and over again, he was led to prepare a list of those which related to the origin and progress of steam navigation." "I found," he says, "that no step in the art of steam navigation had been made which was not the subject of a patent. Among 400 patents, I found that a very few heads would comprise the whole of the inventions; for instance, of vertical paddle-wheels there have been a score of patents which are identically the same in mechanical action; for drawing water at the bow of a vessel and pumping it out at the stern, there have been another score or two; then for making the float-boards of paddle-wheels move in various directions on their axes, there have been also as many patents; and for propellers in imitation of ducks' feet, there has been a large number of patents." A striking instance of the evil resulting from this system is taken from Mr. Woodcroft's evidence. He says: "I have known of a patent within the last year upon which a gentleman had spent about £11,000. He

came and consulted me, and wanted me to go and look at a boat he had been constructing. I said it is of no use; I have seen the drawing, and the invention is as old as the hills, and you will never drive the boat six miles an hour; in addition to that, the invention is not yours—it has been patented over and over again.” Mr. Hodge, an English patent agent, who had personally witnessed the practical working of our system of examination, and heartily approved of it, speaking of the English practice, says: “Many inventors have been ruined in consequence of taking out patents under our (the English) system; whatever amount the patent may have cost the inventor, it may be assailed the very next hour. I can refer to a case in which a patent was tried before a special jury; upon their decision being given, the patentee went out of court saying he was a ruined man. And if he had not had a few friends to come and support him he would have been ruined. If the government had appointed a board of examiners to examine his patent, and to show him that it was not quite original, and that there was a little infringement upon another patent, he would not have had occasion to go to this great cost.”

The evils of this system were many years since pointed out in an able article on patents published in the Edinburgh Encyclopedia, and written by Mr. Simpson, under the direction and sanction of the eminent philosopher, Sir David Brewster, himself a patentee, whose beautiful optical toy, the kaleidoscope, some years ago, used to delight so many thousands of children, and even wise men, with its wonderful changing polychromatic beauties. This writer, after a severe reprobation of the then existing system of patents, observes, “the causes of these aggravated mischiefs are both before our readers, when we say that patents ought not to be granted *of course*, and ‘at the hazard’ of the patentee, but *causa cognita*, by a sufficient and competent authority.” He continues: “The expression is common, that a patent may be got for anything, but very few are found good when they come to the ordeal of a jury. Is not this saying, in so many words, that many that have, ought not to have been granted, and that it is unworthy of this great country to pervert a valuable privilege, and confound the trash of every pretender, whose end is answered by a mere patent mark, with those inventions which illustrate the genius and exalt the character of the people?”

More than thirty years afterwards Sir David Brewster declared that his opinions were clearly expressed in the article above quoted, that the protection of patents ought only to be extended to *new* ideas, and that he would ascertain the novelty of such ideas by means of a board of commissioners composed of scientific persons. It is due to the pervading knowledge that a patent in Great Britain is not even *prima facie* evidence of the originality of an invention, and that it is of little value, except to give the patentee a status in the courts until it has passed a judicial ordeal, that such severe litigation exists in that country in relation to titles to inventions. The costs of such litigation are sometimes frightful. Two startling instances are related by Sir Hugh Cairnes in the speech in the House of Commons, before referred to. A patent had been taken out by an eminent manufacturer in Sheffield for an invention which effected a revolution in the manufacture of steel, by the introduction of a chemical substance, and enabling steel to be produced at a reduction of thirty or forty per cent. on the previous cost. Mr. Heath, the alleged inventor, from the time he obtained the patent, in 1842, till he died, in 1853, spent his life in litigation. The suit was formally carried to the House of Lords, and he obtained a statement which showed that the costs of the defendant were estimated at £7,000, and those of Mr. Heath at £8,000, showing that the two sides had expended in litigation connected with a single patent the sum of £15,000. It appears by the statement of a writer in the London Quarterly Review that this patent was extended in 1853 for the benefit of Mrs. Heath. In August, 1853, Mrs. Heath brought an action against an infringer, and *then, for the first time*, credible evidence was

given that the invention was not new at the date of the original patent. A patent was taken out in 1850 or 1852 by a Scotch gentleman named Menzies for capsules and tops of bottles. The invention being a very valuable one, litigation in connexion with it was carried on both in chancery and in the courts of common law. After, according to Mr. Montagu Smith, a verdict in favor of the patentee, the case was taken to the Queen's Bench, where the patent was defeated on the ground that an *old patent had been discovered* in the office by which the invention had been anticipated. Finally, the case was carried by appeal to the House of Lords, where, in 1862, it was still pending. Sir Hugh Cairnes stated that the solicitor to the plaintiff informed him that the costs of his client amounted to £14,487, and he estimated those of the defendant at £10,370. So that the total costs of legal proceedings, in connexion with the invention, amounted to not less than £24,857. The legal expenses connected with these two patents, which might have been saved to the unhappy litigants by a system of preliminary examination, was £39,857, or about \$199,285, about \$10,000 more than the total expenses of this office for the last year, viz: \$189,414 14, which, during this period, has made examination of 6,014 applications. Of these applications, 1,844 were refused, principally upon the ground of a want of novelty, while 4,170 patents have been granted. It is not pretended that errors from unsoundness of judgment or insufficiency of investigation may not have occurred in these decisions. But I feel confident that, as the general result of our system, its benefits have accrued no less to the unsuccessful than to the successful applicants; that while the latter have secured patents to which an intrinsic value has been imparted by the scrutiny to which the inventions have been subjected, and by the sanction of the office are comparatively protected from infringement and litigation, the former have been saved from waste of time and labor upon well-known machines, and from the cost and misery of defending in courts of law rights to which they could maintain no title. This view of the benefit of a system of examination in preventing infringement and litigation is fully borne out by observation in Prussia, where there is an admirable plan of examination as to novelty by a board of patent commissioners, each one of whom is selected for his proficiency in some special department of the arts. Mr. Weddinge, a member of the board of trade of Prussia, as well as a member of the patent commission, stated, before the committee of the House of Lords, that in Prussia there are very few infringements of the patent rights of patentees, and that manufacturers generally prefer to get permission of the inventor to use his right under the patent.

It is true that litigation to no inconsiderable extent will always exist in this country, where such vast capital is invested in patent property, and especially in relation to questions of interference, or those where the question of priority arises between two inventors, both of whom may have been original authors of the discovery; but the amount of present litigation is trifling compared with the vast number of patents issued, and the value of property based upon them. I assume merely that litigation is most materially prevented by our system of examination. If even this is true, it is the highest commendation of our system, for, as Lord Langdale, the late master of rolls in England, says, "It is the great object of good legislation to cut off the causes or sources of litigation; that I conceive to be the object of government."

It is the duty of patent agents, who now form so important a class of professional men in this country, not too earnestly to press doubtful applications, and not to demand of the office a liberality in granting patents, which, if carried too far, would destroy the system which is the foundation of their business. It is the duty of the office to conscientiously and rigorously scrutinize every application, and to be sure that no patent is granted for anything which is not absolutely new, and at the same time to see that the applicant shall have the benefit of whatever, whether claimed or not, which is shown by specification, model or

drawing, to be a new invention. That both these objects have been kept in view by the office, at least under its more recent administration, is shown by the fact that more than half of the applications upon which patents are granted are amended by the applicant at the suggestion of the office, so that he may not claim any more than has been found by the office examination to be actually new.

The reasons urged by Lord Stanley and Sir Hugh Cairnes, in the important debate so often referred to, that a patent should be granted after an inquiry little more than nominal and formal, it being understood that it should confer nothing more than a right to sue in a court of law, were, that it would be difficult to find men who were competent to pronounce authoritatively upon the novelty and utility of an invention, and that if scientific men were selected to compose a tribunal to pass judgment upon the novelty and utility of an invention, those inventions which were most original, and which, in the end, would be likely to turn out most valuable, would be most unlikely to receive scientific sanction. It was urged, for example, "Sir Humphrey Davy did not believe in the possibility of lighting houses with gas, and had he been acting as a judge, would have condemned that invention as useless." The last objection applies only to the examination as to utility, upon which with us the office does not pronounce judgment. The readiness with which persons acquainted with any particular branch of invention, and provided with facilities for investigation, can determine questions of novelty, is admitted by Mr. Woodcroft, although opposed to the system of examination. Being asked by the select committee whether, supposing he were professionally employed to determine for parties upon the novelty of their inventions, he thought he could undertake generally to determine that point with a moderate degree of time and expense, he replies, "If I had the whole of the specifications before me, I could do it in a moderate degree of time, and at a moderate expense." The facilities for determining the novelty of inventions demanded by Mr. Woodcroft are most amply provided in this office. It possesses a technological library, unequalled by any in this country.* It has opened relations with nearly all the governments in the

* About 14,000 volumes have already been collected. Few or no libraries in the country are so complete in many of the departments of useful knowledge. The collection of encyclopædias and of scientific and technological journals cannot be surpassed. Of journals it possesses not only the leading ones of this country and Great Britain, but those of France and Germany, and also those in the separate departments of science and arts. For example, in photography there are three American, four English, five French, and three German. The office subscribes to ninety-five periodicals, and receives seventy-five by donation, in addition to the Transactions of learned societies. Of these periodicals sixty-nine are in the English language, twenty-seven published in America, and forty-two in Great Britain, thirty-five in the French language, fifty-seven in the German, two in the Italian, and two in the Dutch. Of these, eleven relate to general science, twenty-six to arts and manufactures, fifteen to photography, seven to civil engineering, seven to horticulture, four to mining, six to chemistry, two to chemistry and physics, two to chemistry and pharmacy, thirty-four to agriculture, eleven to literature, three to bibliography, three to statistics, three to mercantile affairs, two each to acclimitization, manufacture of paper, railroad engineering, entomology, gas lighting, patents, military affairs, and architecture, and one each to fine arts, microscopy, law, electricity, medicine, medicine and surgery, pharmacy, veterinary surgery, horology, coal oil, coach-making, printing, bees, botany, and geology.

During the past eight years the office has sent its reports to all the principal libraries and learned societies of the world, and received in return many valuable works, besides the regular publications of the societies. From the Great Seal Patent Office of England, for example, it has received a complete set of its publications, forming a library in themselves consisting of the specifications of patents of the old law series, issued prior to October, 1852, to be bound in 408 volumes of 8vo letter press, and some 350 volumes of folio plates, 378 volumes of letter press, and 378 volumes of plates of the new law series, 35 volumes of indexes, 10 volumes of the Commissioners' Journal, 25 volumes of abridgments of specifications, 1 volume of appendix, and 1 volume of supplement.

To enumerate the more valuable works in this library would be a long and tedious task, as it is well supplied in all its various branches, embracing in the simple subject of photography, the literature of which is of recent growth, 144 separate and independent works,

world for obtaining information, up to each current month, of the progress of inventions abroad. Its portfolios of drawings, so numerous as to crowd two halls, each nearly one hundred feet in length, and yet so systematically arranged that the hand can at once be laid upon any drawing sought for, and its museum of models, unrivalled by any similar collection in the world, exhibit as in an open book all that has been done in American inventions. It is the fault of the administration, and not of the system, if the plan and facilities for examination are not as perfect as human ingenuity has devised.

Another favorable point of comparison of our own with the English policy is the cheapness with which patents are obtained in this country, the cost being limited to the amount necessary to create a fund for reimbursing the expenses of the Patent Office, while in Great Britain the cost of obtaining a patent is £175—over twenty-two times the cost in this country. From the fund accumulated by these fees in five years there was deducted for stamp duties the enormous tax of £67,060. It was in relation to this great grievance that Lord Stanley said, in a pamphlet published in 1856: "One discovery checked, or even retarded, by exorbitant imposts, may cause a greater diminution of wealth, which would otherwise accrue to the nation, than can be compensated by tenfold the gain actually netted by the treasury." The acknowledged object of subjecting patentees to these enormous charges is the prevention of the multiplication of worthless or frivolous patents, and patents for small improvements on valuable inventions, or combinations thereon.

The objections to the frivolity and multiplicity of patents are so often thoughtlessly made, even in this country, as to be worthy of refutation. Those who have carefully studied the progress of civilization must have observed that the uplifting of society has not been effected by paroxysmal convulsions, such as were supposed by geologists of former times to have upheaved the ancient continents at a single shock, but by causes which have operated as gradually and imperceptibly as those which modern science has shown to have actually raised, within historic periods, vast countries, with the whole burden of their cities and unconscious people. The progress in mechanical improvements and in science has been so gradual that it is difficult to trace it except by the great general results. The fields of invention and practical knowledge have been extended by accretions as insensible as those which have formed the delta of the Mississippi. Every new fact in science, every new conception of ingenuity, no matter how trivial, has added something to their area. The noblest inventions which now astonish the world—the steam-engine, the cotton mill, the railroad—have been as truly built up block by block, layer by layer, as the pyramids. More than eight hundred distinct inventions were required to perfect the cotton-spinner. To refer to more recent branches of mechanical industry, we find some of the best harvesting machines protected by no less than twenty patents, each invention consisting of but a trivial improvement, yet the whole being necessary to

not including its periodicals. During the year 1863, 574 volumes and 114 pamphlets have been added to the library. Of these, 308 were by purchase and 380 by donation.

As the business of the office extends and the number of patents is increased, the library will become a more and more important auxiliary. Its use is not confined to the examining corps, but is extended to the inventors of the country and to solicitors and attorneys from the distant cities. To those engaged in the trial of patent cases before the courts it is invaluable, as it is impossible to find so complete a history of the improvement in litigation as upon its shelves.

A liberal spirit ought always to be exercised in the purchase of books, and every means taken to render the library complete, that it may at all times show the condition of the arts. Unfortunately, during the past three years, owing to the decrease of the receipts, it has been necessary to limit the expenditures, but with returning peace large additions ought to be made and improved accommodations be secured. The example of the Great Seal Patent Office, which within a few years has accumulated a library of upwards of 40,000 volumes, may well be followed.

the perfection of the machine. The art of sewing by machinery, which originated no later than 1842, has attained its almost miraculous development in this country through more than six hundred inventions for which patents have been issued. It is by no means asserted that all these inventions have been found practically useful; but perhaps no other art can so well illustrate how, in mechanical contrivances, idea begets idea, and the invention of yesterday gives birth to the invention of to-morrow.

The apparent insignificance of an invention is no measure of its value. Inventions in the meanest of household arts, such as improvements in washing and wringing machines, have not only contributed most materially to domestic comfort, but have given rise to single manufacturing establishments employing over half a million of dollars of capital. Improvements in articles so trivial as hooks and eyes, and pins for infants' clothing, have been the foundation of patents which have produced tens of thousands of dollars.

The application, in a manner to be hereafter described, of a *pencil mark* in submarine blasting, and the explosion of military mines by the electric current, enables the operator to dispense with cumbersome and costly batteries and machinery formerly indispensable. A spring for holding the deflector and chimney upon a coal-oil lamp, consisting simply of a bent strip of brass, has gone into universal use, and through a tariff of a few mills upon each lamp to which the invention is applied, has yielded several hundred thousand dollars to the inventor. The more minutely the arts are studied, the more will the conviction be forced upon the mind that, as the distinction between great and small appears to be unrecognized by Providence, the distinction between important and trivial, and useful and worthless, should never be applied to any original work of human ingenuity.

This is the doctrine of Sir David Brewster, who believed that "patents should be granted for every new idea, whatever that idea might be; that every encouragement should be given to persons to bring forward such ideas; and that instead of throwing difficulties in their way, even when the ideas appear to be frivolous, every facility should be given for their development, because they may contain the germ of future inventions. They may contain ideas which will suggest others more useful and practical; and what is a simple and amusing experiment in one age, may become a great invention in another."

REVIEW OF THE PROGRESS OF THE ARTS.

I proceed next to a review of the progress of the arts in this country within the last one or two years, as exhibited in the different classes of inventions which have been the subjects of examination during this period. For minute information reference must be had to the carefully prepared brief descriptions of all the patented inventions, with the claims of each patent for the present year, and the admirably executed plates of drawings which accompany this report.

I am withheld, for obvious reasons, from giving the names of particular inventors even when they may have exhibited extraordinary merit, and shall attempt only such a general sketch as may indicate the direction which the industry of the country has taken, and may be suggestive to ingenious minds of the fields of invention in which there is the most promise of reward for exploration and discovery.

Upon assuming the head of this office, I found the classification of inventions, by means of which the work of examination was distributed into distinct departments, and the vast collections of drawings and models arranged for ready reference, defective in philosophical arrangement, while the development of new branches of industry exhibited the need of forming new classes; I therefore prepared a new classification of the subjects of invention, which was published for the guidance of the office, and for facilitating inventors and agents in their reference to drawings and models.

In the sketch which I propose now to present I shall follow the order of classification then adopted. It is needless to remark, that in preparing this review I have availed myself of the talent and industry in the office which the law has placed at my command.

CLASS A.

AGRICULTURE.

DIVISION I.—IMPLEMENTS AND MACHINES FOR WORKING THE SOIL, SOWING AND PLANTING.

DIVISION III.—IMPLEMENTS, ETC., FOR PREPARING PRODUCE FOR MARKET.

The most striking fact connected with this class is the rapid increase of applications filed. Notwithstanding half a million of our agriculturists have been withdrawn from the farm to engage in military service, still the number of applications for patents on agricultural implements, (exclusive of reapers, beehives, horse hay-forks, and horse hay-rakes,) has increased from three hundred and fifty in 1861, to five hundred and two in 1863. At first thought such a result would seem an anomaly, but it is this large drain upon the laboring classes which has caused a greater demand than usual for labor-saving machinery. The increased demand for farm products, and their higher price in consequence, have also doubtless helped to increase the number of labor-saving machines: first, by stimulating agriculturists to increase the quantity of their products while they could obtain for them these higher rates; and secondly, by rendering them more able to purchase such machines.

As a general thing, the inventions in this class have consisted in improvements upon existing implements, with the object of rendering them more perfect in their operation and more elegant in appearance; and it is gratifying to notice the degree of perfection attained in the more prominent farm implements of the day. Machines for sowing and planting seed are the most numerous in this class, and they have been brought to such a state of perfection that one can now be supplied with those which will plant everything, from a mustard seed to a potato, either by hand or animal power, and at prices varying from one hundred dollars down to two dollars and fifty cents. In these machines and implements attention has been turned, of late, more to the details, such as inventing improved methods and devices for distributing evenly and without crushing the seed; also in providing machines with indexes for regulating and indicating the quantity sown per acre; in devices for converting them, at pleasure, from drill to broadcast sowers, and *vice versa*; and in improvements by which the tubes or teeth are prevented from being broken or injured by roots, stones, &c.

Much attention has also been given in this class to machines for sowing wheat, oats, &c., which are attached to the body of the operator, worked by a crank, and distributing the seed broadcast by centrifugal force. Next in number and importance are cultivators, which appear to have assumed almost every conceivable form and style. The most noticeable feature in connexion with them is the making of them tall, and so constructing the frame that they may readily pass over corn from four to six feet high, and in so arranging and pivoting the shares that they may be readily controlled in their movements, and enable the operator to adapt their movements to the irregularity of the plants in the row. This feature, as might be expected, emanates from the west, where the hoe is but little used in the culture of this plant.

In ploughs there has been less improvement, the form of the mould-board, which is the main feature, having apparently been brought to a satisfactory condition. Of late more attention has been given to arranging the plough in connexion with a frame mounted on wheels, whereby the ploughman can "both hold and drive" while sitting securely upon his seat; also in arranging two or more ploughs in a gang, whereby one man can operate two ploughs and teams as readily as one, thus saving the time and labor of one man.

In steam ploughs considerable has also been done, mostly, however, in the form of rotating, digging, or spading machines. The demand for increased facilities for raising grain, together with the destruction by war, and consequent scarcity and high price of animals for farm labor, renders this, at present, a most inviting field for inventors.

Machines for threshing and cleaning grain have received a large share of attention, and have been rendered so complete that the grain is now threshed, cleaned, measured and bagged, and the straw stacked, at one operation. Improvements have also been made in the machines by which the dust is taken up and conveyed away, and also by which the bands are cut and the sheaves fed into the thresher. Connected with these is a class of machines of recent origin, by which clover is threshed, separated from the straw, hulled and cleaned, at one operation.

In grain separators great improvements have also been made, whereby oats and foul stuff are more readily and thoroughly separated from the wheat, thereby furnishing a better article for seed, and adding greatly to the market value of the wheat crop.

Dairy implements, especially for the manufacture of cheese and the working of butter, have been much improved. In churns nothing of special importance has been developed, this class generally exhibiting in its improvements more of ingenuity than of utility.

Considerable improvements have also been made in a large number of miscellaneous implements connected with agriculture, such as manure distributors, fruit-gatherers, cow-milkers, field-rollers, cattle and sheep racks, farm and fruit ladders, egg-hatching machines, and machines for manufacturing cigars and tobacco in all its varieties, potato-diggers, straw and vegetable cutters, stone-gatherers, bog-cutters for smoothing rough meadow land and adapting it to the use of the mower, boxes and baskets for packing and conveying fruit to market, &c., &c. Indeed, throughout this entire class there appears to be an increased activity in the effort to substitute labor-saving machinery for manual labor, and, judging from appearances, with most beneficial results.

DIVISION II.—IMPLEMENTS, ETC., FOR HARVESTING AND SECURING CROPS.

The improvements in this class of machines during the year have been chiefly in details of construction, looking rather to the simplifying and the perfecting of the operation of such as are most approved and in common use, than to any marked change in the principle of construction or operation of such machines.

These improvements in details have been numerous, and are believed, in many instances, to have had the intended effect, as is evidenced by the great increase in the popularity of these machines with the agricultural community throughout the country. The large number of reissues of important patents in this branch also tends to show the increased importance which they have assumed, both in a legal and in a commercial point of view. The number of these machines manufactured during the year, as learned from reliable sources, is upwards of 40,000, while the number in process of manufacture, required for the harvest of 1864, is estimated at over 90,000 machines.

DIVISION IV.—GRINDING MILLS FOR GRAIN, SUGAR, ETC.

During the past year the improvements in flouring mills have been, for the most part, confined to the bolting apparatus, looking particularly to the quality of the flour produced.

Machines for hulling rice have been considerably improved and perfected, so that greater quantities can be hulled now, without breaking the grains, in a given time than formerly.

The attention of agriculturists having been, by a necessity growing out of the war, directed to the production of sugar cane, which has added millions already to our national wealth, there have been various improvements in sugar mills, as well as machines for crushing the cane.

CLASS B.

DIVISION I.—CALORIFICS.

This class embraces the devices used in household economy for heating and cooking, as well as some which, like grain-dryers, have a commercial character.

The progress of invention in the whole class is as positive now as at any other time in the history of the Patent Office, although it has long been the popular belief that the ground for improvement in one branch of it, the cooking stove, was almost covered.

Of the three hundred applications in this class in 1863, thirty-five were for improvements in cooking stoves, and some of them are highly original and add greatly to the effectiveness and economy of its operation.

Gas and petroleum stoves are getting to be prominent subjects of invention.

The demands of commerce have called forth many improvements in grain-dryers, the main object in view being to save time and labor in the process of drying the grain. Twenty-five applications were made in this branch of the class in 1863.

Very decided advances have been made in ventilators for railroad cars, the aim having been to bring in an abundance of fresh air, deprived of its usual load of dust and soot, without building costly and cumbrous additions upon the car.

The exigencies of army life have given rise to many inventions in camp stoves and utensils for cooking in the field. Some of these are ingenious and give promise of becoming permanently useful.

There is constant but not very marked progress in the art of heating buildings by means of hot-air furnaces and steam radiators. It is believed that the best results, in a hygienic view, are obtained thus far by the use of steam as a heating medium.

Within the past five years increased attention has been given, both by the public and by inventors, to that kind of coal stoves called "base-burning" or "reservoir" stoves, in which the fire-pot is kept supplied with fuel from a magazine in the top of the stove. The starting point in this kind of stove was from a patent obtained in this country in 1838 by an Englishman, Thomas Joyce. The genius of American inventors has developed his embryonic attempt at a magazine stove, until it has become a successful and practical automaton so far as fuel-supply goes.

Considering the class as a whole, it is clear that although some of the inventions included in the large variety belonging to it are ingenious rather than simple and practical, yet by far the greater part are direct improvements in both simplicity of construction and the manner of use, and they thus become aids to economy both in money and labor; while of the whole number of applications a larger proportion, year by year, are successful, for the reason, chiefly, that old devices are not so often re-invented as formerly.

DIVISION II.—PHOTICS, LAMPS, INCLUDING LANTERNS, GAS, ETC.

The immense development of petroleum, commonly, but erroneously, called coal oil, beginning practically in August, 1858, in western Pennsylvania, and amounting in the year 1863, in the United States, to 6,000 barrels per day, or 2,190,000 barrels per annum, of which one-half is exported and the remainder consumed at home, has directed American inventors, within the last three years, to the construction of a large number of lamps intended specially for its con-

sumption. This will best be seen by reference to the number of applications presented to this office during the last three years as compared with the number for the three next preceding years.

Patents applied for during the year ending—

This oil is rich in carbon and hydrogen, but void of oxygen; and from the excess of carbon evolved, one main object to be attained was to command the oxygen of the atmosphere to effect that degree of combustion most productive of illumination, and thus at once economize oil, obtain a pure white flame, and avoid smoke and unpleasant odor. To this end various devices have, within the last three years, been patented.

1. The deflector previously in use has been materially altered in form, and in some lamps two or three deflectors within each other, used in throwing successive currents of air against the flame above each other.

2. The flat wick has been very generally adopted, being more simple and exposing a larger surface of flame to the air.

3. The glass chimney previously in use, to shield the flame from currents of air and to increase the draught and consequent quantity of oxygen to the flame, has largely maintained its place. In some models the chimney has been extended below the flame, and shortened above it; in others the deflector and chimney have been united; and in others oval chimneys, either of glass or mica, have been made to correspond with the flat flame.

4. The liability of glass chimneys to break from unequal heat, or accident, as well as their expense and general inconvenience, have made it a *desideratum* to construct a good hand-lamp without a chimney, for which purpose many patents have been granted, of very various forms, with more or less success. Some have used numerous very small wicks, others very thin wicks; others have made, in effect invented, metallic chimneys below the flame. To keep the oil in the lamp as cool as possible, so as not to throw off more gas than the flame can consume, various non-conductors have been interposed between the burner and the reservoir, such as porcelain, glass, gypsum, wood, gutta percha, &c. Other inventors have effected the same object by isolating, in a great measure, the burner, by resting it on slight metallic points, &c. In a few examples oxygen has been ingeniously and effectively, but rather expensively, supplied to the flame by a revolving fan-wheel propelled by machinery enclosed within the base of the lamp.

5. Other improvements have been introduced, removing the chimney vertically, horizontally, or obliquely, so as conveniently to turn and light the lamp or supply it with oil; others effecting the same objects without removing the chimney at all. Mica and glass deflectors have been used instead of metallic ones, and glass cylinders surrounding the flame and below it, so as to avoid the shadow around the base of the lamp.

6. The necessities and demands of our great railway system have originated improvements in locomotive *head-lights*, so as to obviate the effect of the motion

of the engine and counteract strong currents of wind; also in *lanterns*, so as to avoid extinguishment by sudden motions, vertically or laterally, and so that the lamp may be easily fastened in or removed from the case and the wick regulated without removal therefrom.

7. Finally, great improvement has been made in the machinery for the manufacture of every part of the lamp, so that for a few cents a good and convenient and even elegant lamp for burning this cheap and highly valuable native oil is now within the reach of every family in the land.

CLASS C.

CARRIAGES AND LAND CONVEYANCE.

Notwithstanding the various improvements heretofore made in land carriages, and the consequent perfection existing in that department, such have been the improvements during the year 1863, that much additional security and comfort have been gained.

Particular attention is given to the matter of propelling carriages by means of steam upon common roads, and a wide field is here opened for the inventive genius of the people; and judging from the present state of this improvement, as well as the progress made in other branches of mechanics, it is not improbable that in a few years the talent now aroused to this important interest will perfect some mechanism by means of which steam will be used upon common roads, as well as it is now upon railways.

While there have been many improvements in the branch of mechanical engineering, comprising horse powers, presses, &c., they have chiefly related to the simplifying and combining of former inventions in order to produce a cheaper and more effective mechanism.

CLASSES D & E.

CHEMICAL PROCESSES, MANUFACTURE AND COMPOSITIONS OF MATTER.

The scarcity of cotton in the northern States has attracted attention to the preparation of fibre from flax, hemp, and other fibre-producing plants. Several patents have been issued for cleaning and separating flax fibres, so as to produce a material to resemble cotton, and which can be spun on the ordinary cotton-spinning machinery. The efforts in this direction, however, have been only partially successful.

The preparation of paper pulp from wood, reeds and straw, has occupied several inventors, and these have attained considerable success, so that the production of paper stock from these materials is now an established manufacture.

The refining of petroleum is now a large and still increasing industry. The inventions in this department relate principally to the construction of stills and condensers. These are now constructed in such a manner as to make the operation of distillation continuous, and so as to separate at one distillation the various products which are derived from petroleum. A new manufacture has grown up during the past year from the waste products or residuum of petroleum. A valuable oil, to be used as a vehicle for paints, has been obtained from what is known as the acid residuum; and a lubricant is made from the tarry residuum of the still. The proper treatment of these residuums is well worth the attention of inventors.

The demands for the different products from petroleum have not kept pace the one with the other. The oil, of medium density, commonly known as illuminating oil, bears the highest price. It is therefore desirable that inventors should direct their attention to the lighter oils, known as carbon spirits, or naphtha, and to the very dense and thick products. To some extent the light

products are now used by varnish makers and others as substitutes for spirits of turpentine. The heavy and thick oils containing paraffine and similar compounds are used as lubricants. But a sufficient demand for these must be created by the efforts of the inventors in finding new applications for them, or new modes of transforming them into more useful products. A valuable application of the heavy oils has been found in their use as a substitute for ordinary tanner's oil for dubbing; thus supplying a much felt want.

A great number of patents has been issued for improvements in apparatus for evaporating the juice of Chinese sugar cane, or sorghum. This kind of apparatus is now brought to a considerable degree of perfection. But heretofore the inventors have aimed only at making a good quality of sirup. This object has been attained, and the attention of inventors is now directed to the making of sugar from the sirup. But very little has yet been accomplished in this direction. In fact, those who have examined the composition of sorghum juice have not satisfied themselves as to its true character. But the indications are that the new sugar plant will be in the future as profitable for the manufacture of sugar as it already has been for making sirup.

The great number of iron-clad ships of war has made a demand for some mode of protecting them from corrosion, and their bottoms from the accumulation of barnacles. Four patents have been issued during the year having this object in view. The first of these depends upon the combination of three different processes, viz: the interior of the hold is lined with zinc plates, the outside is coated with a poisonous paint, and the whole covered with a paint containing metallic zinc in fine particles. The next invention coats the bottom of the vessel with a cheap paint, made by combining copper ore in fine powder, either oxide or pyrites, being used in combination with asphaltum, or the tarry residuum of petroleum, the whole reduced to the proper consistency by light coal oil or petroleum. The other two inventors simply incase the ship or vessel in a vitreous enamel, which may protect the iron from corrosion, but will not prevent the accumulation of barnacles.

The large commerce in petroleum has made a demand for barrels and tanks. The liquid hydrocarbons easily leak through the ordinary wooden casks. To make an oil-tight cask has therefore become a problem of considerable importance, since the leakage from oil casks not only occasions great loss of oil, but makes the danger from fire very great. Fourteen patents have been issued for oil-tight barrels, besides nearly as many more for tanks and cans. Some of those are for metal casks; others for a common wooden cask or tank, with sheet metal lining; but the larger number aims at producing a composition with which to coat or saturate the staves, to make them impenetrable to oil. The difficulty of finding such a composition is increased by the fact that there is generally a small quantity of water diffused through the oil at the time it is put into the barrel, which gradually collects at the bottom, thus making it necessary to have a composition that is impervious to, and insoluble in, both petroleum and water.

CLASS F.—ENGINEERING.

DIVISION I.—CIVIL ENGINEERING.

Under this classification of inventions may be found improvements in architecture, bridges, canals, dams, wharves, roads, &c. For the last year the inventions have in this class been confined in a great degree to the use of iron in its various forms and adaptations to building purposes, such as houses, bridges, &c. The very rapid development of iron mines, the improvements in machinery, and the greater durability of iron structures, seem to have awakened the attention of inventors to the more general application of iron in all structures to which it can be applied. A patent for the construction of domes for public buildings has been issued by the office, in which iron is used exclusively,

giving them a light and airy appearance, and great strength. This invention has been tested upon one of the largest buildings in St. Louis, Missouri, and the principle applied in the construction of turrets for iron-clad vessels.

DIVISION II.—RAILROAD ENGINEERING.

This classification comprises all that is required in the construction and equipment of railroads, exclusive of locomotives, which have become a very useful and important class of invention. As the railroad system of the United States is probably more perfect in its appointments than that of any other country, and has become so necessary in giving that facility of transit to persons and merchandise that our national progress requires, it has received, as it deserves, the attention of practical men, engineers, and inventors. Car-wheels, brakes and couplings, car-springs, chairs, switches, and lubricating journals and bearings of axles, have been the subject of frequent applications for patents under this class. In most instances the invention is confined to specific details and combinations, while in some the most intricate machinery is applied to accomplish the desired results, the expense of which tends to prevent in a great degree their introduction into public use.

Among some of the most novel, as well as important, of inventions under this class, I would notice several, having for their object the change or transfer of cars from the broad to the narrow gauge, or vice versa. The description of these inventions, and the models accompanying them, illustrate the feasibility of the plans devised. They will supply a want hitherto much needed in carrying on the traffic of the country.

CLASS G.

FIBROUS AND TEXTILE MANUFACTURES, INCLUDING LOOMS, SEWING AND KNITTING MACHINES, ETC., ETC.

In looms, improvements have been made by which, in the weaving of tufted or Axminster carpets, the spool frames containing the tufts are automatically taken from the chains on which they are suspended, depressed to the required position, and after a range of tufts has been introduced into the warp and cut off, are returned to the chains; in a mode of holding and combing the tufts when cut off to prevent their becoming entangled; in the means for cutting at one operation a whole range of tufts by a single pair of shears instead of using a pair for each tuft; in the means for preventing the chafing of the warp threads; and in the mode of mounting the warp.

In making fabrics in which warps of India-rubber are introduced, a swinging frame has been added to the loom for the purpose of taking up the slack; also elastic rollers acting on metallic ones to keep the rubber threads in a proper state of tension; also a peculiar mode of driving the shuttles by means of a rack-bar and pinion, and a rack on the shuttles, two sets of shuttles travelling in opposite directions, the rack-bars being connected by cords and pulleys, and thus dispensing with pickers and picker-staves.

Another form of improvement also dispenses with the pickers and staves, as well as the lay and the usual heddle movements, the aim being to avoid the violent concussion, noise and wear consequent upon the motions of these parts, and substitute a progressive weaving operation by means of a system of endless belts which give motion to the several devices used, the heddle being raised and lowered, and the shed opened progressively across the loom, and the shuttle rolled across the warps, and the weft laid up in the shed progressively in harmony with the shuttle movement, the shed opening before and closing after it during its passage.

Within a year or two past looms have also been patented for weaving irregular goods, such as corsets, in which gores are required. The fabric is at the desired stages woven only partially across the warps in a gradually increasing and diminishing series, and the ordinary mode of weaving across the entire warp is resumed when the irregular part is woven; the take-up and let-off rollers being made sectional so as to admit of taking up any portion of the breadth as woven, whether it be at the sides or the middle of the fabric.

The following table shows the annual number of patents for looms for the past ten years :

For the year 1854.....	18
1855.....	32
1856.....	18
1857.....	20
1858.....	17
1859.....	15
1860.....	14
1861.....	22
1862.....	20
1863.....	22

In the class of *sewing machines*, which are justly recognized as one of the proudest triumphs of American ingenuity, the activity and skill of inventors gave decided signs of revival during the past year, notwithstanding the rebellion. The number of patents in 1863 for these machines was fifty-five against thirty-seven in 1862, which was the smallest number for any year since the year 1857.

The aim of inventors has of late been mainly directed to the improvement and simplification of the various styles of machines already patented. These improvements take a wide range, from the most complex machines for sewing button-holes with from two to five threads, to a very unique and simple one-thread machine, formed complete, (inclusive of the feed and looping devices, and needle if desired,) from a single piece of sheet metal, and operated by compressing as a spring a part of the same between the thumb and fingers. The cost of this is a mere trifle, and it seems to mark the furthest extreme of that simplicity and cheapness of structure which are so great a desideratum; and it may yet prove suggestive of something more practical whose price may place the sewing-machine within the reach of the poorest citizen.

Another step in this class is the making of four stitches on the same machine, the changes being made by simply turning a thumb-screw or hand-lever; the same thumb-screw also serving to regulate the length of feed, and to reverse its direction without stopping the machine or removing the fabric.

Several low-priced machines may be mentioned as having revived the mode of automatic sewing with the running or basting stitch by means of a common hand-sewing needle. The improvements in these relate principally to the feed-rollers, some of which are made smooth instead of corrugated or toothed, to the mode of presenting the cloth so that the needle shall penetrate alternately its opposite sides, and to the mode of discharging the cloth from the needle.

The following shows the annual number of patents for sewing machines, and improvements thereon, since the first patent in 1842, with the total up to 1863, inclusive:

For the year 1842.....	1
1843.....	2
1844.....	1
1846.....	1
1849.....	5
1850.....	6
1851.....	4
1852.....	8
1853.....	6
1854.....	36
1855.....	39
1856.....	27
1857.....	54
1858.....	100
1859.....	85
1860.....	74
1861.....	66
1862.....	37
1863.....	55
Total.....	<u>607</u>

If to these be added the number of unsuccessful applications, which may be approximately stated at over 200, we have between 800 and 900 independent applications mostly within the last ten years, indicating a record which, for an invention that may be said to be still in its infancy, is, perhaps, unparalleled.

In knitting machines improvements have been made which admit of making tubular goods upon two straight parallel rows of needles, and with one thread-carrier which delivers the yarn to both sets of needles, either set being susceptible of being thrown out of operative action for the purpose of knitting a straight piece, as for the heel of a stocking.

Other improvements admit of knitting tubular goods of different sizes or diameters on the same circular machine by so constructing it that a number of needles may, at will, be inserted or removed, and still the continuity of the circle of needles be preserved although the circle itself be increased or diminished: this is effected by placing the needles around a conical base or support, and raising or lowering them all uniformly until their barbed ends occupy a circle of the size desired; the other ordinary devices are made adjustable to conform to these changes of position.

Considerable attention has been given to the construction of the burrs or wheels of circular machines; some being made with removable blades to allow of replacement in case of breakage; others have blades of an open-work or skeleton form, to allow more room for the doubled yarn and permit the use of finer yarns.

Several forms of self-lubricating burrs are also worthy of note, the burr having an enclosed oil-chamber surrounding its hollow axis, and having outlets from this chamber to the spindle on which it revolves, thus containing within its own small compass a reservoir sufficient, it is alleged, to lubricate the spindle for a week without further attention, and with much saving in oil, and greater cleanliness to the machine and its products.

As the product of a knitting machine may be mentioned a knitted cassimere, which upon leaving the knitting-frame compactly knitted is passed through the same processes as woven goods; and thus is produced a fabric resembling on the surface the woven cassimere, but having the elastic quality peculiar to knitted fabrics.

Since 1837, 123 patents have been granted for knitting machines; of which 110 have been since the year 1850, and 36 since 1860. Whilst eleven is the highest number in any given year, it is worthy of remark that during the three years of the rebellion there were patented ten in 1861, nine in 1862, ten in 1863, as against seven in 1860.

The following tabular statement of the number of knitting machines patented in this country may not be uninteresting:

Year 1813.....	1
1814.....	1
1815.....	1
1816.....	1
1837.....	1
1839.....	1
1840.....	1
1842.....	1
1843.....	1

In cotton gins the seed is, by a lately patented machine, crushed between revolving and reciprocating rollers, which then carry the fibre to a delivering brush-roller on the opposite side of the machine, the fibre in its transit being cleaned of the crushed seed, &c., by the incessant beating of revolving blades. By another mode the cotton passes between an elastic roller and an endless belt forced in close contact therewith by a concave plate, and is thus griped and pulled through, leaving behind the seeds, which are ejected by reciprocating grooved, toothed cleaning-plate of peculiar construction.

Whilst in spinning, paper, and numerous other machines, in the fibrous and textile class, there has been no dearth in inventions, there does not recur to my mind anything demanding special notice.

The high rates of cotton have drawn much attention to the utilizing of other fibres, and many efforts have been made to adapt flax, &c., to the cotton machines; most of these applications, it is believed, relate to chemical processes.

Machines have been patented for separating the fibres of tropical plants, such

as the *Agave Americana*, the fleshy portions of which are scraped from the long-stapled fibrous portion by drums mounted with widely-separated combs, and scrapers revolving at high velocity under a closely-fitted stationary case.

CLASS H.

FINE ARTS AND GAMES.

This class includes typography, photography, lithography, engraving, etching, stereotyping, sculpture, printing and painting, type-founding and setting, book-binding, preparation of paper for printing, post office and revenue stamps, bank notes, jewelry, enamelling, japanning, and veneering, designs, music, musical notation, games, and implements for the same, &c., &c.

In this class four hundred and twenty-one applications were received during the year 1862; and in 1863 four hundred and seventy-two were received, showing a slight increase. Of the applications examined in 1862, three hundred and fourteen were passed for issue; and in 1863 three hundred and fifty-three were passed for issue. These included one hundred and eighty-four designs in the former year, and one hundred and eighty-one designs in 1863.

Under the head designs, in this class, there does not appear to be a very clear perception of the law. Section eleven, act approved March 2, 1861, is frequently interpreted by applicants to include the mechanical functions of machines and apparatus, as well as the form or ornamentation, which occasions delay in the issues, and sometimes disappointment. In the higher branches of art there are but few applications for patents, as shown by the issues in 1863; of the one hundred and forty-one patents for designs granted, forty were designs for stove-plates; ninety for carpet and floor oil-cloth patterns; and forty-three were miscellaneous, consisting of statuettes, medallions, and trade-marks.

In photography there has been a steady advance, but no marked improvement in 1863. Of the thirty-three applications, a large proportion were for improvements in known apparatus, or the mounting and treatment of pictures. Three were for the preparation of paper.

The internal revenue laws have called out a number of devices, and apparatus of various kinds, for making and cancelling postage and revenue stamps. Thirty-one applications have been made within the year. Some of the devices are very ingenious.

The applications for improvements in musical instruments have gradually decreased since the rebellion.

In printing, binding, and in the apparatus and machinery connected with literature generally, there has been a steady advance and substantial improvement. Printing in colors has now arrived at a point far in advance of former work of its kind. Several lithographic power-presses have been patented and promise well.

Books are now folded by machinery better than they were formerly folded by hand.

CLASS I.

FIRE-ARMS AND OTHER IMPLEMENTS OF WAR.

It was impossible that the country should pass through a great military crisis without an unusual stimulus being given to invention in the subjects of fire-arms and the munitions of war. This impulse, commencing with the year 1861, appears to have reached its culmination in the following year, 1862, and in the past year to have declined to nearly its condition in the former year, 1861. This

is shown in the following table of the whole number of applications filed in the last four years for improvements in this class of inventions :

	1860.	1861.	1862.	1863.
Cannon.....	12	66	81	52
Projectiles.....	17	106	159	81
Small arms.....	78	113	120	115
Cartridges.....	17	12	25	42
Tents, &c.....	2	48	18	13
Miscellaneous.....	13	21	50	19
Total.....	139	366	453	322

Under the above head of improvements in cannon are embraced various appliances for strengthening the body of the gun, devices and mechanical arrangements for operating gun-carriages and heavy ordnance; some few projects of no very striking novelty for rifling cannon, having reference to either the shape of the grooves or the system of their spiral development; methods of loading ordnance; devices for disabling them in case of emergency by the insertion of expanding and jamming plugs within their bore and otherwise; and several contrivances, more or less complex, for rendering artillery many-loaded, by multiple barrels or repeating, by self-feeding magazines, for the purpose of increasing the rapidity of their fire. Plausible as these latter classes of improvements may be, they do not seem to have practically sustained the anticipation of their contrivers.

A number of the improvements in cannon has reference to methods of rendering them capable of being loaded at the breech. The relative numbers of improvements of this class, and of all other improvements in ordnance, actually patented during the last four years, are as follows :

	1860.	1861.	1862.	1863.
Breech-loading cannon.....	3	14	15	8
Other improvements in cannon.....	4	16	28	31
Total.....	7	30	43	39

There are peculiar obstacles to the application of the breech-loading principle to heavy guns which leave but little encouragement to the hope of any great success in this direction. The fact that the strength of material does not increase in the ratio of size, while the explosive energy of the powder is augmented at least as rapidly as its increase of mass, the necessity of adding considerably to the bulk or weight of a gun when it is divided or pierced at the point of greatest strain, and this in a weapon already too unwieldy, and the difficulty of securing the fitting of any considerable moving parts or surfaces exposed to extreme inequalities of temperature, all appear to stand in the way of any available extension of the system, excepting, possibly, in the lightest artillery.

Amid many minor matters, the system of revolving turrets for the use of ordnance may be mentioned as a subject developed and patented during the present national struggle, though really invented many years ago. This method of for-

tification, or of operating cannon, applicable equally to land and naval defences, presents the two great advantages of a more ready direction to, and control of, an enemy's position, and of a more rapid concentration of fire upon any given point. Several applications of steam to the working or manœuvring of heavy guns have also been patented within the last year or two.

Of the class of projectiles (for ordnance) a large proportion of the applications has presented modifications of the packing for reducing or preventing windage between the shot and the bore of the gun, and insuring the full effect of the rotating grooves of rifled cannon.

Some few modifications of no special promise have been made in what is usually known as the "sub-calibre" shot, or projectile, so jacketed as to fill a larger calibre of gun, and present a diminished diameter or area of resistance in its flight through the air. The particular object in using this well-known form of shot is to impart to it a higher velocity (and consequently increased penetration or range) by discharging it from a larger gun, and with a larger charge of powder than the calibre of the shot would require or allow. Tubular steel shot have occasionally been offered as a variation of the "sub-calibre;" various devices have been presented for more effectually securing the packings or the sabots to their projectiles and preventing their separation; and on the other hand, devices have been proffered for more certainly removing or detaching the packings or the sabots from their shot after leaving the gun; some few improvements in canister and explosive shells, and in incendiary shells, have been made; and considerable ingenuity has been exhibited in adjustments for time fuzes, and for percussion and concussion fuzes, designed either to render such fuzes more certain in their action or less dangerous in their handling.

It is in the class of small arms, as was to have been expected, that the greatest activity has been exhibited. Whatever improvements tend to the perfecting of the weapon of the private soldier must have a great value in warfare, where, as is usually the case, masses of men are marshalled to oppose collected masses.

A large proportion of the patents in this class granted in the past two years will be found to embrace improvements in breech-loading arrangements. In reviewing the large numbers of such arms judged to be sufficiently distinctive in some particular feature or features to be entitled to a patent, it would seem as if every conceivable form and direction of the closure and unclosure of a disjointed breech had been exhausted. The numbers of breech-loading and of other arms patented during the last four years are as follows:

	1860.	1861.	1862.	1863.
Breech-loading arms.....	15	19	34	42
Other small arms.....	32	25	38	39
Total.....	47	44	72	81

It will thus be seen that the number of patents granted for breech-loading small arms has been steadily increasing during the four years, while the number of patents for other improvements in fire-arms has continued nearly the same. It should be remarked that the lower line of the above table does not indicate exclusively muzzle-loading patents, as in this line are included a considerable number of improvements, not only on the incidents of locks, sights, bayonet attachments, &c., applicable alike to either form of arm, but also a large proportion of improvements in revolving fire-arms, which belong essentially to the class of breech-loaders.

Of the numerous improvements in revolving fire-arms patented within the past year a large portion relates to adaptations to special forms of fixed ammunition,

or of primed metallic cartridges. The employment of chambered revolving cylinders has *practically* been almost restricted to pistols; but there does not appear any sufficient reason why a method of rendering arms repeating—found to be so convenient and efficient—should not be much more largely extended to muskets, or arms with long barrels.

In view of the very striking advantages presented by breech-loaders in their greater ease and safety of loading, and their rapidity of firing, as well as in the increased facility of handling the arm in many straitened conditions of ambuscade, &c., there seems to be every reason to expect that this class of weapons must before long come largely into use in modern warfare, and probably ultimately displace entirely the present system of loading at the muzzle.

What particular form or forms among the great variety of breech-loaders are best entitled to the government patronage, or most likely to establish their supremacy, is not so easily indicated.

It not unfrequently occurs that the actual value of such an arm, in practical experience, bears an inverse ratio to the amount of ingenuity, skill, and labor expended on its organization and production; and modifications apparently so slight and simple as scarcely to deserve the protection of a patent will sometimes be found to confer a largely increased practical efficiency. It appears evident that, for the requirements of the military service, an arm must be strong and simple in its construction, having few moving parts, and not liable to be deranged by rough and careless usage.

A large amount of attention has been directed to the subject of cartridges for small arms, embracing a great variety of metallic and other cases, mainly for fixed ammunition, and many devices for priming such cartridges so as to render them independent of external means of ignition. The great objection to the ordinary paper cartridge (with all its simplicity and cheapness) is its liability to deteriorate by the absorption of moisture, and its consequent want of reliability after having been kept any length of time.

Many projects have been tried (with varying success) for rendering cartridges water-proof without impairing their efficiency or sensibility. The applications for patents in this class of improvements have steadily and rapidly increased in number within the last few years, and have probably not yet reached their highest range of competition.

The first year of the war for the maintenance of our national sovereignty produced a remarkable influx of applications for improvements in tents, including folding tent-frames, appliances supposed to add to the comfort of their occupants, indefinite slight modifications of the French "Tente d'Abri" or portable shelter, and a variety of convertible blanket-cloaks, beds, hammocks, litters, &c., designed to be folded up and carried as knapsacks. In attempting too much, many of these inventors have rendered their arrangements quite unavailable for the actual and necessary limitations of the military service, though some of these contrivances have doubtless fulfilled their laudable object of partly relieving the hardships of the patriot soldier.

Among the miscellaneous details of cap-machines, bullet-moulds, cap-holders and feeders, cartridge-boxes, tom-pions, &c., there is nothing presented worthy of any special remark.

If in a cursory survey of the general character of the patented improvements in military implements called forth during the present war no great or striking novelties attract attention or excite admiration, the interval has not been barren in real and valuable advancement in the material arts of offence and defence.

Amid much that is merely fanciful and ingenious, many illustrations are afforded of clear-headed and judicious provision to remedy ascertained evils and defects—perhaps the only direction in which important or satisfactory results are to be expected in the present advanced state of the belligerent arts.

CLASS J.

HOUSEHOLD FURNITURE.

In this class 294 cases have been presented during the year. The inventions were distributed in improvements upon furniture for the bed-chamber, nursery, drawing and dining rooms, kitchen, and laundry. One feature of interest appears: nearly one-quarter of all the improvements are for laundry use, consisting of washing and wringing machines, and among these are many improvements upon the simple washing-board.

These labor-saving machines are passing into general use, and, as I have before remarked, there are large manufacturing establishments for their production.

These statements show the genial and important action of the patent law which protected the individual's rights to his invention; otherwise there would have existed no motive for the action of the skill and ingenuity which, under protection, have brought these valuable labor-saving machines towards their perfection, and this to the great benefit of the public.

CLASS K.

HYDRAULICS AND PNEUMATICS.

In water-wheels, the improvements relate chiefly to modifications of turbines and centre discharge wheels. One of these shows the wheel suspended upon a hollow column, through which the vertical shaft passes, to which shaft a collar is attached, resting upon the upper end of the hollow column. This collar may be elevated and depressed by means of set screws so as to adjust the wheel in position and prevent leakage. In other cases, by means of ball governors, the gates surrounding a vertical wheel are opened and closed, and the flow of water regulated. In one instance a vertical wheel is arranged with an annular space around it. Within the inner wall of this space an elastic diaphragm surrounds the wheel, which consists of three arms, each having a roller at its end held to duty by a spring in the arm. These rollers press the diaphragm out against the wall as they revolve, and the water flows behind them through ports leading from the annular water space without. In centre discharge wheels, the improvements consist generally in various modifications of cams for opening and closing the swinging buckets as they recede from or approach the stationary abutment, and in suspending the wheel from the upper end of the shaft on friction rollers or otherwise. In many of these wheels, however, the chutes that guide the water to the wheels are stationary, and the buckets are fixed in relation to their radius. Another modification of the vertical wheel consists in admitting the water at the bottom and permitting its discharge from the top, the buckets being spiral; and a variation of this consists in placing the wheel some distance below the level of the stream, and conducting the water through it from its base to a distance above the surface of the stream by means of an annular passage placed over the buckets, the object being to take advantage of the momentum of the falling water. In an over-shot wheel the buckets are so formed as to retain a considerable portion of the water until the bottom of each successive bucket is in a perpendicular position under the wheel; and to this end an aperture in the bottom of each bucket permits a portion of its water to fall into the bucket next below rather than fall by overflow directly to the ground.

Improvements in rotary pumps relate chiefly to the adjustment of pistons which slide into interior cylinders against resisting springs by means of cam movements, stationary abutments being placed in the required relation to the induction and eduction ports. In some cases the pistons are held in contact with the inner periphery of the cylinder by means of water in place of the

spring, the aperture for the escape of the water under pressure being adapted to the desired celerity of the movement.

A reciprocating pump of horizontal action operates by forcing down half the water elevated, two pistons on a single horizontal stem being thereby moved in a valve just below, and while forcing water alternately up two pipes, creating a vacuum behind the latter or rear piston, and thus inducing an influx from the well.

A lift pump consists of three cylinders, the outer and the inner stationary, and the intermediate moving between the other two and carrying a valve piston upon its end, which receives the water from a valve at the base of the outer cylinder and forces it through a valve in the lower end of the inner cylinder, through which it is conveyed by pipes to any desired point.

A horizontal reciprocating pump of double action has a transverse division plate in the centre of its cylinder, and in each division thus formed a piston is moved, both by the same gearing, and in this manner a continuous discharge from a single eduction port is effected.

An engine for raising water consists of a horizontal cylinder, in which a piston moves to give motion to the other working parts. The water, flowing from a source of sufficient elevation, ascends through a pipe and passes to a valve located immediately under the cylinder, which valve controls the amount to be admitted to the ends of the cylinder alternately. The position of the valve is automatically changed at each stroke by the movement of the piston.

In water elevators windlasses are so arranged as to enable the operator to prevent or permit the descent of the bucket by means of friction plates, arranged upon the shaft in such manner that slight pressure upon the crank, in a line parallel to the cylinder, controls the movement of the cylinder.

In lubricators a tube is inserted in the stem, which screws into the cap of the journal box. This tube is so small, that atmospheric pressure prevents the escape of the oil, until affected by the increased temperature of the journal. Another lubricator adapted to the cylinders of steam-engines has a right and left hand screw upon the stem, to which are attached two valves so arranged that a continuous movement in the same direction controls the movement of both valves simultaneously—the upper one opening to permit the oil to flow into the body of the lubricator, and as it closes, the lower one opening to allow the oil to flow upon the cylinder. In another, steam is admitted above the tallow, by which it is melted, and afterward forced into the cylinder of the engine.

In a pipe for conveying water to buildings, a chamber is formed having a perforated diaphragm placed transversely within it to prevent the passage of fish and other matter to the smaller pipes. At each end of this chamber a stop-valve is placed to shut off the flow while the chamber is being cleansed through a lateral port.

CLASS L.

LEATHER AND HARNESS.

Improvements are numerous and progressing in the complicated and diversified machines and machinery for the manufacture of leather into boots and shoes, much ingenuity having been devoted thereto. Though few of the improvements of the past year are anything more than slight improvements upon previous inventions, yet important results arise from slight improvements; so that now effective machines are supplied for performing every operation with leather, of which it is susceptible, in the production of boots and shoes. Much improvement has also been made during the past year in *hand tools* for shoemakers and saddlers, desirable for their simplicity, compactness, and labor-saving facilities. Improvements have also been made in harness, saddles, bridles, spurs, travelling trunks, carpet and mail bags, of a convenient and practical character, uniting economy with better adaptation.

Valuable improvements have been made in buckles, snap-hooks, and other devices of that description. Several styles of skates and skate-fastenings have been patented, some of the latter very ingenious, complicated, and expensive; the inventions principally being improvements for securing the skates to the boots, whereby, when they are properly fitted, they may be attached and detached without unbuckling the straps, at the same time relieving the feet from the pressure and pain attending other modes.

CLASS M.

LUMBER.

This class embraces all the machines and tools for working in wood, the most important of which are sawing-mills, machines for re-sawing lumber, planing machines, turning lathes, and barrel machinery.

During the year 1863 there were two hundred and twenty-four applications for patents in this class.

Saw-mills are the most important, as well as the initiative machine, for manufacturing lumber, and only a few years have elapsed since such mills were disproportionate in their parts, imperfect in their design and operation, and unsightly in their structure; but with the improvements in the machinery now in use by which the sawing is done, we find them comparatively lighter, more compact, and requiring less attention to the operation of sawing, whilst the work is more perfectly done, and a saving is effected by producing more lumber from a given amount of unmanufactured material.

Gearing for saw-mills was once looked upon as a great objection, on account of the loss of power necessary to increase motion; but this opinion has given way to the march of improvement in all labor-saving machines. An "up and down" saw for sawing lumber is now driven over four hundred strokes a minute, whereas in former times one hundred and fifty were considered the maximum speed. Then the saw was one-fourth of an inch in thickness; now one-half that thickness of saw is used, requiring much less power to cut through the log, as well as causing a saving of the difference in the thickness of the kerf at every cut in the lumber.

With the rapid strides of improvement in this direction, the old method of sawing lumber by the "up and down" saw is becoming less used, and the circular saw is supplying its place, a great proportion of the lumber being now cut by means of this saw.

As the forests which have hitherto supplied the choicest kinds of timber begin to fail, invention comes to our aid. By means of improved sawing machines now in use, ship timber can be sawed from crooked or curved logs, which, with the old process, could not be made available except by hand-sawing; and further, we are able to saw not only on a curve, but at any angle desired, with equal facility as straight or square work, and both by the "up and down" and by the circular saw, thus accomplishing a most desirable result.

Planing machines have become indispensable in most of the branches of wood-working; and with the best machines now used the mechanic has his lumber given into his hands with only the *smoothing* wanting, it having been wrought to the right size and shape, or tongued and grooved, or beaded, or a moulding having been cut thereon, more perfect than can be done by hand tools.

Lathes for wood-turning have been much improved, by which we are enabled without additional attention to turn wood in various irregular forms, such as round, oval, nearly square, hexagonal, of any number of sides or angles, and

to almost any desired pattern, and in many lathes this is done nearly automatically. Wagon spokes are formed to shape, with square or round tenons cut upon the ends; screw-threads and spirals are also cut with great facility and exactness; a perfect sphere can be turned without placing the block to be turned between points or centres at all, so perfect is the machinery now in use for these purposes.

Staves and heading for coopers' work, for which the best of timber with the straightest grain was required, are now made from timber regardless of crooks, curves, or twists in the grain, being either *sawed* or *cut* into the desired shape; or if split, the twist in the grain is no objection, as a machine will dress a stave without loss of timber on account of the twist. Heading, after being sawed or cut from the bolt, is planed to the proper thickness, jointed, dowelled, and cut to a given circle and shape ready to be inserted in the barrel, by a single machine. The crozing, bevelling, and jointing of the ends of the staves after being set up into a barrel, are performed by a machine at a single operation. The hoops used on barrels are now made by cutting them from the edge of a plank having the thickness of the width of the hoop, ready pointed or tapered, of equal thickness, or one edge thicker than the other, ready for use, causing a great saving in time and labor over the common method of making such hoops from round poles.

What is said of the few more prominent machines in this class, as to the progress of improvement, can also with equal force be said of most others not specially enumerated here. The machines and tools for the working of wood into various forms, and fashioned to the wants of all, are nowhere else to be found in the same state of perfection as in the United States.

CLASS N.

MATHEMATICAL AND PHILOSOPHICAL INSTRUMENTS, ELECTRICITY, ETC.

In almost every subdivision of this class, inventive genius has been successfully active; and although the subjects are apparently among the most peaceful pursuits of life, yet the present war has elicited some valuable contributions to the progress of improvement in this connexion. Among the patents intended more particularly for army and navy purposes, are telegraphs for the field and for use on ship-board, for steering purposes and communication with the engineers; electric fuzes for cannon and blasting, torpedoes, signals on land and at sea, telescopes for rifles, telescopes for measuring distances, field glasses, mariners' compasses for iron-clad vessels, and others of indirect relation, such as portable scales for weighing and engineering apparatus, designed especially for army and navy uses.

These have all passed in review and received the sanction of letters patent. Conspicuous among them is a magneto-electric telegraph, now in extensive use in the United States army for field purposes, and elsewhere for ordinary telegraphic purposes. This is a signal triumph in electro-mechanics, for by the motive power of a small magneto-electric machine, occupying less than a cubic foot, a dial or index telegraph is operated through great distances, from five to two hundred miles, with the prospect of greater and indefinite extension. It was found with the Atlantic telegraph in 1858, that alternating, or to and fro currents, were indispensable to its operation, and the magneto-electric machine of the telegraph before us has the peculiar movement of normal to and fro currents in rapid succession, without any extra contrivance for their production, this condition growing out of the very arrangement of the magnetic poles and helices. The operators for this telegraph require no training, and any person who can read, can telegraph. For the Morse telegraph, two or three years of training are required. It is not liable to piracy by tapping, as is the Morse tel-

egraph, and may be justly regarded as the inauguration of a new era in telegraphy, by dispensing with the cumbersome, uncleanly, unhealthy, and inconstant galvanic battery as the motive power, and the introduction of a simple and economical telegraph, adapted with equal facility to domestic and public purposes. It is not too much to say, that the days of telegraphing by the galvanic battery are numbered, and that the magneto-electric machine will ere long take its place for this, as well as for many other purposes.

Another highly interesting development in magneto-electric science is the discovery and application of a new mode of ignition for purposes of blasting with powder. Hitherto torpedoes and other powder blasts, fired by electricity, have depended upon the ignition of a very fine platinum wire. When this had to be done through long circuits or at great distances, very large and expensive galvanic batteries were required, owing to the great diminution of the quantity of electricity. It was proved by experiments made at the Capitol many years since, that 150 pairs of Grove's battery were necessary to ignite powder by the finest of platinum wires placed in the telegraphic circuit between Baltimore and Washington, a distance of forty miles. By means of this new discovery, powder has been fired through the distance of 100 miles by means of a little magneto-electric machine, occupying less than a cubic foot. This astonishing achievement has been accomplished by means so simple that electricians will wonder as much, if not more, than the uninitiated. It is done by a *pencil-mark*. The stroke of a common black-lead pencil on a block of wood is substituted for the platinum wire, and this disintegrated conductor, as it may be called, is so intensely ignited by the magneto-electric current as to set fire to the wood.

The application of this ingenious device within a suitably prepared cartridge will be hailed as one of the most valuable contributions to mining and engineering operations of the present day.

Following upon this discovery was an interesting application to the firing of cannon by magneto-electricity, dispensing with the vent or touch-hole, which, although hitherto a necessity, has been regarded as a weak point in cannon.

Experiments made at the navy yard in this city prove the firing by this method to be wholly successful, one thousand cartridges having been fired by the inventor without a single failure.

A patent has been granted for an electro-magnetic telegraph for steering vessels, and public exhibitions made of the practical operation of the system. By very ingenious mechanism, the orders of the pilot to the engineers and helmsman are given with such promptness and unmistakable precision, that its early introduction, especially in the immense vessels of the present day, may be reasonably looked for.

The electric and magneto-electric lights have also been subjects of examination and of patents, and there can be no material doubt now as to the practicability of the magneto-electric light for light-houses and other purposes of signal lights.

The magneto electric current passing between charcoal points has been used in a light-house at Dungeness, on the English coast, since 1862, and the light is said to possess more power of penetration than any other light.

From these and other cursory observations of the recent developments of magneto-electricity, flattering promises rise up in the contemplation of its future.

The steam-engine is hardly eighty years old, and the magneto-electric machine hardly thirty. It is only about forty years since the steam-engine was fairly appreciated, and hardly a decade since the magneto-electric machine was duly recognized in the family of practical mechanics, and if its future career should be commensurate with its past, it will take high rank among the great engines of human progress.

Some ingenious contrivances have been made with a view to prevent the local influence of iron in ships on the mariner's compass, and especially for use in

iron-clad ships. These are in connexion with the water compasses, in which the needle swings in a liquid, and the box so elevated above the mass of iron in the ship as to be beyond its influence, while the deviations of the needle may be observed from below.

In one instance it is asserted that a peculiar arrangement of wires, conveying an electric current, operates so as to completely intercept local influences and not interfere with that of the earth, or produce any local effect of its own. The office has had no verification of this improvement.

CLASS O.

MEDICAL AND SURGICAL INSTRUMENTS.

The most fruitful subject under this class is that of artificial limbs, more applications having been examined in the year than in all previous years combined. Some excellent improvements have been developed, the painful experience of the war affording the inventor ample opportunities for studying all the requirements for artificial limbs, and adapting their construction to all the varieties of amputation.

Crutches have also been much improved, and several patents granted for new contrivances, tending chiefly to give them strength and lightness, and facilitate the manufacture.

Numerous improvements in hospital beds, ambulances, stretchers, apparatus for treating fractured and bruised limbs and wounds by a constant drip of cold water, coffins and burial cases, all bear melancholy testimony to the horrors of war.

CLASS P.

METALLURGIC MANUFACTURES.

In this class the applications for patents made during the past year have exceeded in number by only about six per cent. those of the year previous. It is worthy of remark, however, that while there has been a slight falling off even in the number of inventions of a miscellaneous character, and those least conducive to the progress of the industrial arts, a more than corresponding increase is observed in that class specially required by machinists; such as machines for forging, rolling, bending, drilling, planing, boring, turning, and the like. Improvements in this class were found to be necessary to meet the demands created by the war, and, as in everything else, northern genius and northern hands have met the emergencies as they arose. Thus the improvements made in our navy—the substitution for wooden ships of those clad in metallic armor, and otherwise constructed to be, as nearly as possible, proof against the shot and shell of the enemy—not only added greatly to the amount of work which the machinists of the country were suddenly called upon to furnish, but made new and improved machinery therefor indispensable.

Improvements in the construction of ordnance, fire-arms, and projectiles, were also made, which have given rise to new methods of founding, and improved machinery for constructing and finishing. But, while many of the most important inventions may be said to owe their origin to the war, very many others of a different class, but of little less importance, such as machines for making nails, bolts, nuts, screws, horseshoes, sheet-metal ware, as well as a great variety of tools and implements for working in metals, which can claim no such special impulse, may very properly be attributed directly to wants growing out of, and increasing with, the general advancement of the nation.

CLASS Q.

METALLURGY.

The inventions in this class relate to processes and apparatus for roasting and smelting ores; refining iron and making steel; the making of new alloys; the washing and separating of ores; and for amalgamating and collecting the precious metals. About fifty patents have been allowed during this year in this class, some of them for very valuable improvements.

In roasting ores an important improvement has been made, which consists in passing the ore in fine powder through flame, or the hot gases from combustion. By this process each minute particle of ore is roasted by itself, and the result is that the roasted ore is in fine powder instead of being in an agglomerate mass, as it is when the ore is roasted in a heap. It is well known that but a small part of the gold in pyritous ores is obtained by the ordinary modes of working. If not roasted, the gold is encased in the sulphurets so as not to be reached by the mercury. If the ore has been roasted in the common mode, the incrusting slag or earthy oxides still protect the gold, to a great extent, from the action of the mercury. By the new mode of roasting, it is believed that the precious metals will be found diffused through the fine powder in globules of easy access to the mercury.

The powdered ore may either be blown through the flame from a reverberatory furnace, or it may be allowed to fall through a shaft, and then be acted upon while falling by flame and hot vapors or gases. Immediately after the ore leaves the flame it is thrown or falls into water, whereby the earthy matters in it are further disintegrated.

The production of iron and steel has been greatly advanced during the year. The principal aim of inventors has been to produce the better qualities of iron, and, especially, to make iron possessing many of the qualities of steel. The large demand for the best kind of iron for war and naval purposes, and for the production of a better class of agricultural implements, has greatly stimulated this branch of industry.

It has long been an object with inventors to make malleable iron on a large scale directly from the ore, instead of making first pig iron, or cast metal, and then burning out the carbon in it by puddling or other means. Several patents have been issued for accomplishing this. These are on the principle, not now new, of reducing the ore by the hot products of combustion, yet keeping the temperature so low as not to fuse the mass of ore. When reduced, the metal is raised to a welding heat, and at once formed into blooms, one fire serving both for the welding and the reducing processes.

Several minor improvements have been patented on what is commonly known as the Bessemer process.

Three patents have been issued for making steel, by combining in different modes cast and wrought iron, the novelty consisting only in the mode of effecting the result. One of these processes consists in heating in a crucible the wrought iron to a white heat, and then letting into the crucible pig or cast iron directly from a blast furnace or cupola. Another inventor makes a kind of steely iron, by melting together, in proper proportions, particular kinds of cast iron and bar iron. The third process consists in treating the cast iron on the puddling hearth until it becomes granular and spongy, then throwing it into water, and reducing it to powder. This powder is then enclosed in a wrought-iron box, which is subjected to a welding heat, and the box and its contents placed under the hammer.

Two patents have been issued for new alloys of the metal aluminum. By one of these very close imitations of gold are obtained. The other is for an improved gun-metal.

About twenty patents have been issued for improvements in gold-washers, ore-separators, and apparatus for collecting gold and silver by the process of

amalgamating them with mercury. Compared with former years, this shows increased interest in mining for the precious metals. Several of these improvements are for the new mining fields of Nevada and Colorado Territories.

It is scarcely possible to classify the inventions in this department.

For a while most of the devices consisted in making different parts of the machines of amalgamated plates.

For grinding and amalgamating at the same time, all the known machines have received improvements. The ordinary tub and corrugated muller is more used in California, but not to the exclusion of the arastra and German barrel. In washers and separators the gig-mill seems now to be the favorite, though the old-fashioned ripple and sluice machines have received considerable attention.

CLASS R.

NAVIGATION.

The improvements upon the construction and equipment of vessels-of-war are numerous, and relatively of the greater interest; nevertheless, because the attention of inventors is fixed on the navy, the number of the applications of the usual character, presenting improvements upon steering and propelling apparatus, sails and rigging, and the like, have increased, these improvements being applicable both to the commercial marine and to the vessels-of-war. Thus the number of cases of this class acted upon has increased, amounting to 127 cases for the year.

Much ingenuity has been applied to the defensive metallic armor for "iron-clad" vessels. The improvements in this range relate to the kind of plates, to plates solid as one mass, and as divided into strata or laminæ, to the fastening of the armor to elastic cushions or intermediates between the plates, and to elastic *backing* of the armor.

In one case the invention places a stratum of wood exteriorly in front of the metallic defence, in order that a part of the force or momentum of the shot may be absorbed by its action on the wood before it comes in contact with the interior iron plates; it is also proposed that plating in laminæ be used, the strata of which are to be held somewhat apart by angle iron; this, on the ground that the greater action of the shot on the exterior plate, and upon plate after plate, will dispose of more of the momentum of the shot than if the plates were rigidly connected in one mass.

There has been invented a combination of plating elastic intermediates, backing and elastic washers for the bolts; this to provide for a slight but general yielding of the armor upon being struck by the shot.

A defensive armor has been invented with openings in it. These recesses are angular and funnel-shaped, and are intended to receive, and, in connexion with hollow beams, to convey the shot harmlessly across the ship; fusible metal is proposed to be cast between two separated plates upon the ship's side. Compound plates have been invented, such as a mass composed of fusible metal cast between a network of wrought-iron bars diagonally crossing each other.

These instances show a wide range in the action of the inventive mind; and it is by such essays, changes, and improvements, that an approach to the perfect will be attained.

Attention has been given to the Ericsson or "monitor turret." The improvements in this respect propose no change of general principle or mode of structure; they have reference to the perfecting of the details of construction, to additional or different supports, to facilities of rotation, and to greater conveniences in working the guns. Port-hole stoppers have received much attention, and, apparently, with valuable results.

There are cases of improvement upon the *steam* ram, to be used in penetrating and sinking the enemy's vessels. These relate to the strength of the beak, or striking part, and are intended to give, at its supporting parts, additional strength of construction. There has been attention to the use of the oscillating

ram, so arranged as to strike repeated blows. There are also inventions for grappling with the enemy's ships, and for boring holes into their hulls under water; and inventions for conveying torpedoes under the enemy's ship, and so on.

The ingenuity which has been exercised upon submarine batteries appears to possess interest. These batteries are guns arranged to be discharged under and through the water, in order that the shot may penetrate the enemy's ship below her line of flotation. It was, and is now, generally believed that a gun fired with muzzle under water would burst. In one case the improvement consists in filling the bore of the gun, beyond its loading, with an air-tight metallic case or cylinder; on firing the gun the metallic case is sent out, and, collapsing, its contained air lightens up or gives elasticity to the water; this not only permits guns to be fired safely through the water, but it is said that an experimental shot from the gun thus used passed through twenty-five feet of water, and thence through both of the sides of the bottom of an old hull of a vessel devoted to experimental practice.

Another inventor proposed to accomplish the result by the extension of air-tight sliding, or telescopic tubes, from the gun towards the object of attack.

An examination of this class shows that a patent was issued to Thomas Gregg, of Connellsville, Pennsylvania, at the early date of March 19, 1814, for a metallic-plate-protected vessel, having angular sides, in order to deflect an enemy's shot upward or downward, as it should strike above or below the apex of the angle of the sides of the vessel. This not only presents the first invention of metallic defence for vessels, but also Mr. Gregg's angular structure by far anticipates Captain Jones's angulated system of ship-building, "patented in England as late as the year 1859."

To depart, in this instance, from the rule of not introducing names from the high character of the parties and their former relations with our government, the patented improvements of the Messrs. Stevens, pertaining to their steam battery, evince the extreme of skill and surpassing inventive genius. These improvements are so numerous, and so closely bound together into a system, that the necessarily short expositions of this report can do no justice to them. It may not be generally known that their experiments resulting in these improvements were commenced as early as the year 1816. Mr. Stevens, the elder, and his son are regarded in Europe as the *fathers* of the art of the application of metallic defensive armor to vessels.

The investigation of the office, in this class, has brought to light certain facts to which it may be well to refer.

A committee composed of a rear-admiral and four post-captains of the British navy, in the report on harbor defence, recommend, as the principal expedient, the obstruction of *harbors* by sinking in their channels vessels laden with stone, thus recognizing this expedient as an accorded right of warfare. An Englishman has invented a shell, which, on exploding, is to throw out *suffocating and poisonous flames*.

These propositions had been entertained in Great Britain, and yet British sympathizers with the southern rebels had the presumption to express indignation because vessels laden with stone were sunk in Charleston harbor, and because Greek fire was used in shelling that city. A sound philanthropy rejoices in the successful use of all expedients known in warfare to secure the great object, the preservation of the integrity of this nation, and the permanence of its form of government.

CLASS S.

STEAM AND AIR ENGINES.

The progress of improvement in steam, air, and gas engines has been regular and important throughout the year, not only in the minor features of existing apparatus, but in some instances in radical characteristics.

A new engine, composed of an oblong cylinder, has two pistons of like form,

working one within and at right angles to the other. Both pistons are connected to the crank-shaft in such a manner that, when one is passing the dead point, the other is exerting its maximum force. A very ingenious valve is so applied as to act as an induction and eduction valve to both pistons. This valve is capable of reversing the motion of the engine by a simple change of its position.

Many improvements have been made in balanced slide valves, and in pistons.

An apparatus for preventing the priming of steam boilers consists of a series of pipes attached at intervals to the steam space of the boiler from the front to the rear end, and leading to the main steam pipes, placed on both sides of the boilers which pipes convey the steam to the engine. The object of this arrangement is to take the steam from where it is generated in the boiler, and thus prevent the rush of steam over the surface of the water to its eduction port.

In a device for governing the speed of engines by the velocity with which the steam enters an enlargement of the steam pipe, containing a piston and valve, the piston is so connected with a jointed portion of the valve rod that the eccentric will open the valve to admit steam to the engine, a greater or less distance in proportion to the velocity of the steam pressing upon the piston, in the enlargement of the pipe.

A marine engine has an additional eduction valve placed at the centre of the cylinder for the purpose of allowing a portion of the steam to be withdrawn at that point of the stroke of the piston to heat the feed-water, instead of being allowed to remain in the cylinder to urge the piston to the completion of the stroke.

A modification of this device is simply to make an aperture through the cylinder at the same point, in which to insert the eduction pipe, which is provided with a valve to prevent the reflux of steam; the object in this case being to condense the steam discharged from the cylinder of the engine by the first eduction by delivering it into the hot well of the engine. The arrangement of the parts, and not the general idea, is the subject patented.

An improvement on Stevens's cut-off consists in placing upon the rock-shaft movable tappets, and an arm carrying a screw with sliding nuts attached, which nuts bear upon projections from the tappets, and thus enable the engineer to change the position of the tappets, by which means steam is cut off at any desired portion of the stroke.

Various improvements have been made in surface and other condensers; some being placed outside the vessel, and below the water-line, and some inside and below that line, so that the motion of the vessel causes a current of water to pass through or around the condenser, as the case may be. A peculiar device consists of two or more narrow, deep tanks, placed one on each side of the condenser, and connected with it by pipes in such manner as that the water circulates through the condenser from the tanks, and thus the water in the tanks is used again and again. At one end, and near the top of the condenser, is attached another pipe, the opposite end of which is connected with the tank some distance above the point of attachment of the previously mentioned pipe. About midway of this pipe (the one attached near the condenser) is attached still another pipe, which communicates with an ordinary fan-blower, designed to force a current of air through these pipes and into the tank, where it mingles freely with the water, and thus serves to cool the water in the tank, and to condense any steam that may arise from the surface of the water.

The improvements relating to boilers, furnaces, and flues have reference principally to economy of fuel, and consist in devices for the admission of atmospheric air, and its thorough admixture with the gases evolved from the burning fuel in such manner as to insure better combustion of these gases. Combustion chambers are placed between the fire-box and the flues, into which pipes are inserted connecting with the water space of the fire-box at the top on one side, and at

the bottom on the other. Inside these pipes are placed others communicating with the external atmosphere through perforations, in which pipes the air is admitted to and commingled with the gases in the combustion chamber.

Another economic arrangement consists in corrugating that portion of the shell of a steam boiler which is exposed to the fire, and so applying a corrugated jacket thereto as to form a flue space enclosing the corrugated portion of the boiler shell, this flue space communicating with the principal internal flues of the boiler, which, also, are corrugated; the object being, in the whole arrangement, to increase by corrugation the surface of the boiler and of the jacket exposed to the heat, the parts exposed to radiation being preserved plain in the usual manner.

In air engines the improvements relate principally to the construction of the piston, which is formed in such manner that all the air to be heated is made to pass through the piston for the purpose of preventing too great a temperature. The air, after being heated, is conveyed through an outlet pipe, directly to the reservoir, from which it is taken to propel the engine. The air is forced through this piston by means of air pumps placed immediately over the cylinder of the engine, which pumps are actuated directly by the piston of the engine itself. The communication is kept up by means of a bent pipe having a telescope joint.

In the devices for raising water by steam the improvements relate to various modifications of the Giffard principle. A simple device of this class consists in the use of a T piece, with the induction steam pipe secured to one end and passing horizontally through the T piece, and over the induction opening for water. A pipe is then secured to the opposite end of the T piece for the purpose of conveying the water to the desired point. The induction steam pipe is provided with a valve for regulating the influx of the steam. The steam being discharged into the eduction pipe causes a vacuum to be created in the T piece, into which water from the well rushes and is carried forward by the steam.

CLASS T.

GLASS, STONE AND CLAY.

Inventions in this class have displayed much ingenuity, although no very important results can be referred to. In the manufacture of glass, one object sought for has been the substitution of machinery for hand labor in polishing, dressing and ornamenting glass. Improvements in this direction have so far succeeded that several articles, such as globes, vases, goblets, &c., may be operated upon simultaneously by a single workman. Great perfection in the execution of the work has been attained by the use of the new machinery. The most elaborate designs, tracery or lettering, previously delineated on paper, are reproduced upon the surface of the glass by machine work. The particular form of the glass is immaterial for the successful operation, the designs being executed with equal facility upon flat, cylindrical or angular forms.

In machinery for drilling rocks there are improved devices for holding and rotating the drill and adjusting it in a more or less inclined position. By another device the drill is made to act upon the rock by uniform blows throughout the entire depth of the hole to be drilled, the drill being rotated and fed to its work by automatic machinery.

CLASS U.

WEARING APPAREL.

Improvements affecting wearing apparel are usually made in the production of the materials of which the various articles are fabricated, and in the sewing machines employed in the production of such articles; yet, minute as they may appear to many minds, the succession of improvements called forth from year to year in the direct manufacture of clothing must always constitute an in-

teresting feature in the inventions of the time, contributing alike to the promotion of the convenience and comfort of the people and to the gratification of the general taste.

During the present year many of the inventions in this class have had reference to economy of material. Thus a shirt has a plain bosom, which, when opened out in lappels, reveals a fanciful lining and another bosom within, of finer texture and more comely appearance, of which the outer lappels are, when closed, the efficient protectors. Shirt collars of paper are formed by dies with embossed counterfeit stitching. Water-proof enamelled collars and bosoms are distended and preserved in shape by elastic metallic forms. The toes and heels of stockings are made in separate pieces, to replace the worn-out portions of stockings in use. Ruffles and dress borders of many patterns are made with great exactness and at very small cost, by slight adaptations of the ordinary sewing machines. Hats are pressed into form by steam or other fluid, acting upon flexible diaphragms; and the brims of soft hats are distended and curved by narrow springs in their peripheries, which admit of folding so that the hat may be carried in the coat pocket. Hat blocks are made expansible by the action of cams, so that a bell shape presents no obstacle to the insertion or removal of the form. The extensive use of clasps in connecting the tapes and wires of hoop skirts, and of eyelets in corsets and other articles of apparel, has led to the construction of ingenious automatic apparatus for conducting the clasp to the anvil and affixing them to the cloth, and for punching the cloth and conducting the eyelet and securing it therein.

PROPOSED MODIFICATIONS.

The last subject which I have proposed to consider is the question of the modification of the existing patent laws. I have endeavored to show that our system may be favorably regarded in comparison with any other existing. This view involves the opinion that no laws materially affecting our present system are expedient. The decision of the courts, and the practice of agents and inventors, are conformed to the present laws. It is therefore desirable that there should be no legislation in relation to the subject of patents except to perfect and carry out the theory and principle of the present system. It is in this view that the recommendations for modifications of existing laws are now made. By the act of March 3, 1863, it was provided that a fee of fifteen dollars should be paid upon the filing of an application for a patent, and that an additional fee of twenty dollars should be paid upon the ordering of the patent to issue. The office having been embarrassed by the delay of many inventors in paying the final fee, a provision was made by law, that if the final fee for a patent be not paid within six months from the time at which it was passed and allowed, and notice sent to the applicant or agent, the patent should be withheld, and the invention therein described should become public property as against the applicant therefor. Some cases of great hardship have occurred under the operation of this law. Applicants have been absent from the country, have been ignorant of the existence of the law, or have failed, by accident, to transmit the final fee within six months. I respectfully recommend that the present law be so modified as to confine the forfeiture to the pending *application*, leaving it optional with such applicants to renew their applications for the same inventions, and any modifications they may choose to introduce, or not, as they may elect; and that this modification be also extended to such inventions as may have already been forfeited under the act of 3d March, 1863.

A modification of the existing laws has been suggested by patent solicitors of great experience, which commends itself to my approbation. It has been repeatedly decided by the courts that the application of what is old, to a new

purpose, is not patentable. The records of the office show that hundreds of patents have been granted in defiance of these decisions, while an examination of the rejected department will bring to light as many applications which have been refused upon reference to these decisions. It is difficult to conceive of any sound reason why the application of what is old, to a new purpose, should not be the subject of a patent.

The attention of an expert bridge-builder is directed to iron bars of a peculiar sectional form. He perceives that these bars can be applied with useful effect to the construction of a truss frame bridge. He makes a stronger, lighter, and cheaper bridge than had before been made. He applies for a patent, and must be refused upon the principle of these decisions, because bars of the form he uses had been known before and used for other purposes, and, therefore, he has done nothing more than apply what is old to a new purpose. There seems to be no reason in principle why the sound judgment and inventive faculty which led the bridge-builder to apply these bars to a new purpose should not be rewarded. I respectfully submit a draught of a bill designed to remedy this defect in our law and practice.

CONCLUSION.

In concluding this report, I am impelled to present in prominent relief the important fact that, although the country has been engaged in a war which would have seemed to tax to the utmost all its energies, the applications for patents for the last year have been equalled in only two former years; and yet one-half of our territory, shrouded in the cloud of rebellion, has contributed nothing to invention or human improvement.

The institution which has blighted that portion of the republic has long since recorded in this office its adverse influence to the arts and civilization. It appears that in the year 1857 there were granted to citizens of Massachusetts 421 patents, being a proportion of one to a population of 2,362. In the same year there were granted to citizens of Virginia 58 patents, a proportion of one to 24,511; to North Carolina 14 patents, a proportion of one to 62,064; and to South Carolina 12, a proportion of one to 55,708.

Labor being degraded in these States, there was no stimulus to mechanical activity; and as labor-saving machines were supposed to have the effect of supplanting and diminishing the value of slaves, improvements were regarded as injurious to the paramount interest of the State. It was only by unparalleled efforts that a northern inventor succeeded in introducing into the cotton States the gin, which added a hundred-fold to their productiveness and value. This invention is an example of the benefit which the South will derive from new arts to be applied to her peculiar climate and products.*

* In an interesting work lately published, entitled "In the Tropics, by a settler in Santo Domingo," the author says:

"Those who say the treasures of the tropics are to be best won by the brute force of ignorant labor, cannot have studied with sufficient patience the march of invention.

"Intelligent laborers; men who know how to make wood and iron perform the severest part, to the sparing of human sinews; men who can work steam in harness, these are what is wanted here.

"Under the warm sun of the south *intelligent men and machinery will yet open the grandest field of civilization ever realized.*

"Even in such a small matter as hoeing a corn field this is illustrated. Without violent labor I do as much clearing in a short forenoon with my little donkey cultivator as three good field hands in a whole day, and do the work much more effectually. Rating the donkey and myself as equal to a pair of Dominicans, the cultivator, which neither eats, sulks, nor runs away, (to which as a class they are subject,) counts for four common hands, which are subject to all those defects. The cultivator, I repeat, counts for four laborers, and asks no wages."

The imagination fails to conceive of the happy future in store for this country when its fairest portion shall be regenerated by the adoption of a just system of labor, and conquered by free industry; when its land, by this change, shall, according to the remarkable estimates of Mr. Walker, have an increased value of over six billions of dollars; and when a whole race shall be taught to think, contrive, and create. The richest field of invention, with its fruits of wealth and prosperity, will then be opened that ever occupied the faculties of man. The visions of Virgil and Milton will be realized, and—

“Time will run back and fetch the age of gold.”

D. P. HOLLOWAY,
Commissioner.

No.	Patentee.	Invention or discovery.	Date.	Class.
6019	Dean, Linus, and A. Higham	Wheels, cast-iron car	Jan. 9, 1849.	X.
6198	Dearborn, John M.	Ranges, cooking	Mar. 20, 1849.	V.
6661	Decker, John	Freezers, ice-cream	Aug. 21, 1849.	IV.
6867	Degum, Francis	Hat-brims, curling	Nov. 13, 1849.	XXI.
6376	De Haven, John J.	Fire-box, removable, for locomotives	April 24, 1849.	VI.
6768	De Haven, John J.	Fire-boxes of steam boilers, removable, water lining for the	Oct. 2, 1849.	VI.
6151	Delano, Calvin	Rakes, horse	Feb. 27, 1849.	I.
6952	Dempsey, Robert M.	Bran-dusters	Dec. 18, 1849.	XIII.
6610	Devlan, Patrick S., assignor to G. S. Langdon	Boot heels, metallic	July 24, 1849.	XVI.
6049	Dickey, Ebenezer J.	Planters, seed	Jan. 23, 1849.	I.
6576	Diehl, David	Planters, seed	June 12, 1849.	I.
6291	Diehl, Hannah, and Charles M., administrators of William Diehl, deceased.	Nail plate feeder	April 10, 1849.	II.
6182	Dimpfel, Frederick P.	Smoke-consuming apparatus	Mar. 13, 1849.	VI.
6675	Doan, George N.	Drilling machines, combined construction and operation of the drill in	Aug. 24, 1849.	IX.
6772	Doane, Calvin	Ovens, portable	Oct. 9, 1849.	V.
6425	Dodge, George H.	Yarn, apparatus for spooling	May 8, 1849.	III.
6102	Dory, Cyrus B.	Bricks, coloring	Feb. 6, 1849.	XV.
6722	Doughty, J. H.	Privies, signal for	Sept. 18, 1849.	IX.
6585	Dow, C. C.	Bonnets, pressing	July 10, 1849.	XXI.
6436	Dow, Jesse E.	Tent frames	June 5, 1849.	XXIX.
6970	Dow, Phineas	Borer and elevator, earth	Dec. 25, 1849.	IX.
6609	Downer, Charles	Unloading carts, &c., apparatus for	July 27, 1849.	XII.
6144	Draper, George	Temples, jaw, for looms	Feb. 27, 1849.	III.
6891	Dugard, Thomas	Saw-mills, curvilinear	Nov. 20, 1849.	XIV.
6622	Dugdale, Joseph A.	Beehives	July 31, 1849.	I.
6478	Dunham, Daniel	Stoves, cooking	May 29, 1849.	V.
6493	Dutton, Carlton	Railroad turnout	June 5, 1849.	IX.
2658	Dyott, Michael B.	Lamps for essential oils, &c.	May 30, 1842.	V.
6344	Eastman, Arthur M.	Bobbins, driving	April 17, 1849.	III.
6174	Eastman, Robert, assignor to Maria L. Eastman	Balances for weighing	Mar. 13, 1849.	XII.
6919	Eayrs, William	Stone-dressing machines	Dec. 4, 1849.	XV.
7137	Eccles, Samuel	Looms for figured fabrics	Mar. 5, 1850; antedated Dec. 22, '49.	III.
6134	Eddy, James M., assignor to John Kimball	Turning irregular forms, machinery for	Feb. 20, 1849.	XIV.
6117	Edwards, William A.	Pearlash, manufacture of	Feb. 20, 1849.	IV.
6737	Egbert, D. N.	Churn dashers, rotary	Sept. 18, 1849.	I.
6371	Eldred, Allen	Hemp, &c., machinery for breaking and dressing	April 24, 1849.	III.
6606	Eldred, Allen	Ploughs, hill-side	July 24, 1849.	I.
6164	Elgar, John	Rail, two-part, tubular	Mar. 10, 1849.	IX.
6303	Elgar, John, and Benjamin Hallowell	Cradle, revolving, for unloading canal-boats or sections thereof	April 10, 1849.	IX.
6997	Ellicott, Ely, and Samuel A. Abbott	Scale, lever, for canals, railroads, &c.	Feb. 6, 1849.	XII.
6491	Emerson, Richard H.	Locomotive, with driving axle above the boiler	May 1, 1849.	VI.
6676	English, Michael	Gold-washer	Aug. 28, 1849.	II.
6255	Eriesson, John	Steam-engine, an auxiliary employment of, in combination with the condenser pump.	April 3, 1849.	VI.

6844	Ericsson, John.....	Engine, arrangement of, for using steam expansively	Nov. 6, 1849.	VI.
6332	Essex, Jeremiah.....	Squares, carpenters', machine for making	April 17, 1849.	XIV.
6746	Essex, Jeremiah.....	Baths, shower	Sept. 25, 1849.	XX.
6061	Evans, Evan Lewis.....	Stoves, cooking	Jan. 30, 1849.	V.
6591	Ewing, David L.....	Wheat-cleaning machines	July 17, 1849.	I.
6827	Fagin, Lewis.....	Mills for grinding	Oct. 30, 1849.	XIII.
6169	Fairbanks, Thaddeus.....	Balances, double-scale	Mar. 13, 1849.	XII.
6895	Fairbanks, Thaddeus.....	Scales, platform	Nov. 20, 1849.	XI.
6192	Farrand, Jehial T.....	Water, apparatus for drawing, from wells	Mar. 20, 1849.	XI.
6756	Farrand, Jehial T., and William Hinman.....	Water, machinery for raising, from wells	Oct. 2, 1849.	III.
6316	Faulkner, Augustus.....	Looms for weaving	April 17, 1849.	III.
6813	Faulkner, Augustus.....	Looms	Oct. 23, 1849.	V.
6067	Feinour, Joseph.....	Stoves, cooking	Jan. 30, 1849.	X.
6041	Felton, Horace, Perley D. Cummings, and Harington Hinckly.....	Wheels, cast-iron plate car	Jan. 23, 1849.	XV.
6907	Fenton, C. W.....	Pottery ware, glazing	Nov. 27, 1849.	II.
6323	Ferrell, William.....	Pastener, stopper sash	April 17, 1849.	XVIII.
6664	Fife, Andrew.....	Inkstands	Aug. 24, 1849.	XVIII.
6278	Fife, Matthew S.....	Pens, metallic	April 3, 1849.	I.
6018	Filkins, John D.....	Bog-cutters	Jan. 9, 1849.	X.
6657	Finch, Edward.....	Wheels, car, manufacture of	Aug. 21, 1849.	XIII.
6658	Finlay, James.....	Regulators for water-wheels, &c.	Nov. 13, 1849.	I.
6379	Finney, William C.....	Cotton scrapers	April 24, 1849.	IV.
7616	Finsel, Conrad W.....	Sugars, draining	Sept. 3, 1850; antedated Oct. 12, '49.	I.
6593	Fisher, Luther B.....	Vegetables, cutting, crushing, and grinding	July 17, 1849.	II.
6054	Fisher, M., and W. Martin, jr.....	Iron, cast, process for welding to wrought or steel	Jan. 23, 1849.	I.
6569	Fisk, John W.....	Winnowing machines	July 3, 1849.	XX.
6512	Fitch, Samuel S.....	Braces, shoulder	June 5, 1849.	XIX.
6090	Fitzgerald, Jesse.....	Cannon, sectional, bolt and disk	Feb. 6, 1849.	VII.
6670	Fitzgerald, Jesse.....	Trenails, machinery for dressing	Aug. 28, 1849.	X.
6688	Flack, John J.....	Axles of carriages	Sept. 4, 1849.	VI.
6637	Flagg, Josiah F.....	Spark-arresters, locomotive, and smoke-conductors	Aug. 7, 1849.	IX.
6042	Flagg, J. F. B.....	Railroads, rails and wheels for turning curves of	Jan. 23, 1849.	II.
5994	Flanders, Joseph F.....	Shears, circular, and beading tool combined	Jan. 2, 1849.	XV.
6383	Fletcher, George, sr.....	Stone, machines for polishing	April 24, 1849.	XII.
6194	Flint, Tilly and Warren.....	Steelyards for weighing	Mar. 20, 1849.	XXIII.
6825	Folger, Andrew J.....	Accounts, ledger, keeping	Oct. 30, 1849.	I.
6802	Follet, Abner.....	Bog-cutting machines	Oct. 16, 1849.	XXII.
6297	Forbes, Archibald H.....	Bottle-stopper, undetachable swinging	April 10, 1849.	IV.
6815	Forbes, Robert B., and John Ericsson.....	Distilling sea-water, apparatus for	Oct. 23, 1849.	X.
6442	Ford, Mason H.....	Carriages, railway, annunciators for	May 8, 1849.	XV.
6399	Foss, Cotton.....	Grindstones, machines for making	April 24, 1849.	XIII.
6377	Foster, Charles.....	Belts, rope, forks for holding upon drum wheels	April 24, 1849.	X.
6608	Foster, Junius.....	Hubs, connecting with axles	July 24, 1849.	I.
6920	Foster, Samuel W.....	Grain separators	Dec. 4, 1849.	I.
6450	Fountain, James L. and Henry K.....	Harvesters	May 15, 1849.	I.
6544	Francisco, Samuel P.....	Churns, atmospheric	June 19, 1849.	XVII.
6302	Frank, Theodore.....	Tables, extension	April 10, 1849.	XV.
6882	Frost, John W.....	Brick, machines for moulding	Nov. 20, 1849.	XI.
6426	Fulton, George W.....	Pumps	May 29, 1849.	XVI.
6826	Farley, William.....	Barrel carriages	Oct. 30, 1849.	IX.
6934	Gardner, Abel.....	Harnes, apparatus for bending	Dec. 11, 1849.	
6828	Garnsey, Ebenezer.....	Weather strip	Oct. 30, 1849.	

Persons whose patents for inventions have expired, &c.—Continued.

No.	Patentee.	Invention or discovery.	Date.	Class.
6845	Garsed, Richard	Looms for weaving figured fabrics	Nov. 6, 1849	III.
6668	Garside, Joseph, and Henry J. Detjemann	Bedsteads, machinery for cutting screws in	Aug. 28, 1849	XVII.
6368	Gatchel, Joshua L.	Rams, water	April 17, 1849	XI.
6393	Gay, David	Beer fountains, portable	April 24, 1849	IV.
6325	George, Ammi M., and Ephraim Brown, assignors to Nathan Richards and Lucius C. Alexander.	Spike machine, revolving die	May 18, 1849	II.
6684	George, Dennis, jr., and Norman Millington	Squares, carpenters', graduating	Aug. 28, 1849	XIV.
6970	Grow, John L.	Stoves, cooking	Jan. 30, 1849	V.
6352	Gilbert, George	Staves, machinery for dressing	April 17, 1849	XIV.
6558	Gill, George E., and Joseph B. Tillinghast	Churns	June 19, 1849	I.
6692	Gilman, Alonzo, assignor to William Johnson	Paper, machines for cutting	Sept. 4, 1849	III.
6494	Gilmore, Arza	Beehives	June 5, 1849	I.
6165	Goffin, Francis Charles	Lock, door, by a combined key and gauge, also a thief detector	Mar. 10, 1849	II.
6522	Goffin, Francis C., and Conrad Liebrich	Leek, pad	June 12, 1849	II.
6423	Goodman, Agdalena S.	Broom brushes	May 8, 1849	XVII.
6843	Goodman, Allen, and Hammond Doane	Lathes for turning	Nov. 6, 1849	XIV.
6786	Goodyear, Nelson	Suspenders, elastic cords for	Oct. 16, 1849	XXI.
6571	Gore, Emory and Emerson	Windmills	July 3, 1849	XI.
6068	Grainger, R. D.	Stoves, cooking	Jan. 30, 1849	V.
6069	Grainger, R. D.	Stoves, cooking	Jan. 30, 1849	V.
6046	Grant, William	Lathes, chucks for	Jan. 23, 1849	XIV.
6601	Gray, A. N.	Whiffletree hook	July 24, 1849	X.
6012	Green, Benjamin H.	Telegraph wires, painting	Jan. 9, 1849	IX.
6801	Green, Thomas J.	Gold-washers, rockers of	Oct. 16, 1849	II.
6737	Greene, James D.	Boats, life, form of the air chambers of	Sept. 25, 1849	VII.
6935	Greenwood, Asa	Clothes-pins, machinery for turning	Dec. 11, 1849	XVII.
6071	Grenville, Alonzo S.	Compound, lubricating	Jan. 30, 1849	IV.
6120	Griee, Francis	Vessels, blocks for supporting bilges and keels of	Feb. 20, 1849	VII.
6489	Griest, Gideon	Brakes for carriages	June 5, 1849	X.
6411	Gridley, Josiah A.	Churn dashers	May 1, 1849	I.
17017	Griffiths, Robert	Propeller	April 7, 1857; antedated Sept. 13, '49.	VII.
2455	Grimes, William C.	Spark-arresters	Feb. 12, 1842	VI.
6123	Grinnell, Samuel H.	Rakes, horse	Feb. 20, 1849	I.

6602	Young, Samuel S.	Calculating machines.	July 24, 1849.	VIII.
6876	Zisemann, Ferdinand	Brick-presses.	Nov. 13, 1849.	XV.

ALPHABETICAL LIST OF PERSONS WHOSE PATENTS HAVE EXPIRED DURING THE YEAR 1856.

No.	Patentee.	Design.	Date.
807	Allen, John F., assignor to Stratton and Massey	Stoves, cooking.	June 17, 1856.
816	Ames, Winslow	Stove, box, plate	July 15, 1856.
783	Beesley, Jacob, assignor to Cresson, Stuart, and Peterson	Furnace, summer.	April 15, 1856.
841	Beesley, J., and E. J. Delany, assignors to Cresson, Stuart, and Peterson	Stoves, parlor	October 7, 1856.
820	Blake, P., and E. W., and J. A.	Drawer-pulls	August 5, 1856.
798	Bosworth, Albert, assignor to Albert Bosworth and Timothy H. Leomis.	Piano-forte legs.	May 27, 1856.
837	Bridge, Hudson E.	Stoves, cooking	October 7, 1856.
845	Bridge, Hudson E.	Stoves	October 14, 1856.
851	Bruce, George	Printing types	December 2, 1856.
765	Burnam, Sanford, assignor to Cox, Warren, Morrison & Co.	Stove-plates	February 12, 1856.
767	Coggshall, Wm. S.	Stoves, parlor	February 19, 1856.
855	Davy, John T.	Grates, parlor	December 23, 1856.
856	Davy, John T.	Stoves, cooking	December 23, 1856.
857	Davy, John T.	Stoves, cooking, parlor	December 23, 1856.
782	Delany, Edward J., assignor to Cresson, Stuart, and Peterson	Oven, gas	April 15, 1856.
801	Diller, Isaac	Stoves	June 17, 1856.
848	Duiley, James J., assignor to Fuller, Warren, and Morrison	Stoves	November 4, 1856.
796	Dyott, Michael B.	Watch safes, paper weights, and pin cushions combined	May 27, 1856.
788	Engle, Isaac	Piano-forte legs	May 13, 1856.
769	Evaus, Theodore	Forks and spoons, handles of	March 4, 1856.
789	Gallagher, Anthony J.	Stoves, cooking	May 13, 1856.
832	Gibbs, Samuel W., assignor to A. H. McArthur & Co.	Stoves, cooking	December 9, 1856.
833	Gibbs, Samuel W., assignor to G. W. Ball & Co.	Stoves, cooking	December 23, 1856.
808	Gibbs, Samuel W., assignor to North, Chase, and North	Stoves	June 24, 1856.
840	Gibbs, Samuel W., assignor to North, Chase, and North	Stoves	October 7, 1856.
806	Gibbs, Samuel W., assignor to Treadwell, Perry, and Norton	Stoves	June 17, 1856.
770	Gibbs, Samuel W., assignor to W. and J. Treadwell, Perry, and Norton	Stoves, elevated oven	March 18, 1856.
793	Gibbs, Samuel W., assignor to W. and J. Treadwell, Perry, and Norton	Stoves	May 20, 1856.
850	Gibbs, Samuel W., assignor to Wood, Roberts & Co.	Stoves, kitchen	November 25, 1856.
763	Gleason, R., jr., assignor to R. Gleason & Sons	Bottle-casters and egg-cup stands	February 12, 1856.
831	Glominski, A., assignor to D., A. E., and N. B. Powers	Floor-cloths	September 16, 1856.
832	Glominski, A., assignor to D., A. E., and N. B. Powers	Floor-cloths	September 16, 1856.
859	Glominski, Antoine, assignor to D., A. E., and N. B. Powers	Floor-cloths	December 23, 1856.
838	Gott, John	Busts of J. C. Frenont	October 7, 1856.
780	Granger, Albert	Pen, steel	April 15, 1856.
784	Green, William H.	Casters	April 22, 1856.
817	Hackett, Joseph	Stoves, cooking	July 29, 1856.
794	Hathaway, David, assignor to Cox, Richardson, and Boynton	Stoves, parlor	July 1, 1856.
826	Hathaway, David, assignor to Cox, Richardson, and Boynton	Stoves, parlor	August 19, 1856.
795	Herrick, Thomas H., assignor to Lemuel M. Leonard	Stoves, cooking	May 20, 1856.
797	Horton, James, and John Currie, assignors to Cox, Hager, and Cox	Ranges, portable	May 27, 1856.
760	Johnson, L.	Printing type	February 12, 1856.
814	Macy, John C.	Grate, ornamental, for fire-places	July 9, 1856.
847	Muller, Charles	Statuettes of Burton as Captain Cuttle	October 21, 1856.
771	Muller, Nicholas	Clock-case fronts	April 1, 1856.

786	Muller, Nicholas	Clock-case fronts	April	29, 1856.
787	Muller, Nicholas	Clock-case fronts	April	29, 1856.
812	Muller, Nicholas	Clock-case fronts, the base of	July	1, 1856.
813	Muller, Nicholas	Clock-case fronts	July	1, 1856.
823	Pierce, Samuel, and J. J. Dalley, assignors to Fuller, Warren, and Morrison	Stoves, cooking	August	5, 1856.
764	Pierce, Samuel, and J. J. Dalley, assignors to Fuller, Warren, and Morrison	Stoves, cooking	February	12, 1856.
822	Pierce, Samuel, and J. J. Dalley, assignors to Fuller, Warren, and Morrison	Stoves, parlor	August	5, 1856.
766	Pierce, Samuel, and Sanford Burnam, assignors to Cox, Warren, and Morrison	Stoves, cooking	February	12, 1856.
809	Pratt, Samuel F., assignor to W. and J. Treadwell, Perry, and Norton	Stoves	June	24, 1856.
834	Pratt, Samuel F., assignor to Treadwell, Perry, and Norton	Stoves, oven	September	23, 1856.
833	Pratt, Samuel F., assignor to Treadwell, Perry, and Norton	Stoves, parlor	September	23, 1856.
775	Ransom, Samuel H.	Stoves, cooking	April	1, 1856.
772	Ransom, Samuel H.	Stoves, parlor	April	1, 1856.
774	Ransom, Samuel H.	Stoves, cooking	April	1, 1856.
773	Ransom, Samuel H.	Stoves, parlor	April	1, 1856.
776	Ransom, Samuel H.	Stove-plates	April	1, 1856.
781	Ransom, Samuel H.	Stoves, six-plate	April	1, 1856.
792	Read, Joseph A., assignor to John H. Cahill	Stoves, cooking, elevated oven	April	1, 1856.
799	Resor, Wm.	Stoves, cooking	April	15, 1856.
800	Resor, Wm.	Oven and stove doors	May	13, 1856.
791	Sanderson, W. L., and N. S. Vedder, assignors to Sanders, Wolle, and Warren	Stoves, cooking	June	3, 1856.
818	Shepherd, J. and R.	Stoves, cooking	June	3, 1856.
849	Smith, Elihu	Stoves, cooking	June	13, 1856.
854	Smith, Garretson, and Henry Brown	Stoves, cooking, plates of	March	13, 1856.
803	Smith, Garretson, and Henry Brown, assignors to J. G. Abbott and A. Lawrence	Clock fronts	July	29, 1856.
802	Smith, G., H. Brown, and Jas. A. Read, assignors to J. G. Abbott and A. Lawrence	Stoves, parlor	November	11, 1856.
804	Smith, G., H. Brown, and Jas. A. Read, assignors to J. G. Abbott and A. Lawrence	Stoves, air-tight	December	23, 1856.
805	Smith, G., H. Brown, and Jas. A. Read, assignors to J. G. Abbott and A. Lawrence	Stoves, cooking	June	17, 1856.
830	Smith, G., H. Brown, and Jas. A. Read, assignors to Cox, Hager, and Cox	Stoves, cooking	June	17, 1856.
844	Smith, G., H. Brown, and Jas. A. Read, assignors to Hayward, Bartlett & Co.	Stoves, nine-plate	June	17, 1856.
811	Smith, Garretson, Henry Brown, and Joseph A. Smith, assignors to Leibrant, McDowell & Co.	Stoves	June	17, 1856.
785	Smith, Harvey, and Frederick A. Sheldon	Stoves, cooking	September	16, 1856.
761	Thompson, James M.	Stoves	October	7, 1856.
753	Vance, S. B. H., assignor to Mitchell, Bailey & Co.	Stove-plates	June	24, 1856.
754	Vance, Samuel B. H., assignor to Mitchell, Bailey & Co.	Stove-plates	April	22, 1856.
777	Vance, Samuel B. H., assignor to Mitchell, Bailey & Co.	Bricks, moulded	February	12, 1856.
778	Vedder, N. S., assignor to Cox, Richardson, and Boynton	Pendants, hall	January	2, 1856.
821	Vedder, N. S., assignor to G. F. Filley	Pendants or chandeliers, hall	January	2, 1856.
843	Vedder, N. S., assignor to Graff, Reisinger, and Graff	Chandeliers	April	8, 1856.
842	Vedder, N. S., assignor to Mann, Torrence & Co.	Chandeliers	April	8, 1856.
825	Vedder, N. S., and Ezra Ripley, assignors to Cox, Richardson, and Boynton	Stoves, cooking	August	19, 1856.
827	Vedder, N. S., and E. Ripley, assignors to Sweetland and Little	Stove-plates	August	5, 1856.
810	Vedder, N. S., and W. L. Sanderson, assignors to North, Chase, and North	Stoves, cooking	October	7, 1856.
839	Vedder, N. S., and Wm. L. Sanderson, assignors to North, Chase, and North	Stoves, cooking	October	7, 1856.
779	Vedder, N. S., and Wm. L. Sanderson, assignors to North, Chase, and North	Stoves, six-plate	August	19, 1856.
828	Vedder, N. S., and W. L. Sanderson, assignors to North, Chase, and North	Stoves, cook	August	26, 1856.
829	Vedder, N. S., and W. L. Sanderson, assignors to North, Chase, and North	Stoves	October	21, 1856.
790	Vedder, N. S., and W. L. Sanderson, assignors to N. S. Vedder	Stoves	June	24, 1856.
768	Vose, Samuel D.	Stoves	June	24, 1856.

Alphabetical list of persons whose patents for designs have expired, &c.—Continued.

No.	Patentee.	Design.	Date.
819	Wardwell, Benjamin, and Ephraim R. Barstow.....	Stoves, cooking.....	July 29, 1856.
759	Wesche, Herman E., assignor to Robert Wood.....	Gates.....	February 5, 1856.
762	Wesche, Herman E., assignor to Robert Wood.....	Gates.....	February 12, 1856.
755	Wetherill, Augustus E.....	Bottles, perfumery.....	January 8, 1856.

DESCRIPTIONS AND CLAIMS OF PATENTS

ISSUED IN THE YEAR 1863.

ILLUSTRATED WITH ENGRAVINGS.

No. 37,266.—AUGUSTUS ALGOEVER, of New York, N. Y.—*Improved Wire-work for Fences.*—Patent dated January 6, 1863.—Straight rods of wire are crimped or bent into three depressions at intervals, the depth of each depression being a little more than half the diameter of the wire rod. The wires are placed diagonally a short distance apart, with others conversely, with the depressions up and between the rods. Straight and uncrimped rods are then placed through the upper and lower diagonal rods, through the passages formed by the depressions in the same. By applying the force of a hammer upon the intersecting portions it reduces the thickness to that of two layers of wire, and bends the straight rods in the same manner as the others were before being applied: thus forming a firm and secure intersection in which the wires will not separate from each other.

Claim.—The method of constructing wire fence and other wire work, by first crimping a portion of the wires to be used in such manner that, being laid in a proper position for the work intended to be made, the indentations formed in them will admit of the insertion of straight wires in such a manner that they will form a lock to the whole when finished, substantially as described.

No. 37,267.—JAMES S. & THOMAS B. ATTERBURY, of Pittsburg, Penn.—*Improvement in Kerosene Lamps.*—Patent dated January 6, 1863.—This invention consists of a glass lamp collar of peculiar construction, adapted to prevent the transmission of heat from the burner to the reservoir of oil.

Claim.—As a new article of manufacture, a glass collar C constructed and applied to a lamp in the manner and for the purpose substantially as set forth.

No. 37,268.—MELLEN BATTEL, of Albany, N. Y.—*Gold Washer and Amalgamator.*—Patent dated January 6, 1863.—This apparatus consists of a series of toothed annular plates secured to the casing of the machine and inclining down towards the centre, and a corresponding number of revolving toothed plates mounted on a vertical shaft, and occupying the spaces between the stationary plates. The material to be washed or scoured, falling on the outer part of the upper stationary plate, is acted on by the teeth of the revolving plate above, and passes inward by its own gravity until it falls on the centre of the revolving plate next below, whence it is carried outward by centrifugal action until it falls on the stationary plate next below, and so on to any extent required.

Claim.—The mode of constructing and using two or more concave plates, with points or pins passing between each other; one or two or more of these plates are stationary, as shown, h and I, with rims forming the recess for the revolving plates, as shown, S and T, and one or two or more revolving plates are hung on a vertical shaft on the under side of the stationary plates, as shown, E and F, substantially as before described.

No. 37,269.—GEORGE C. BEECHER, of Livonia, Livingston county, N. Y.—*Improvement in Anti-Friction Car Wheels.*—Patent dated January 6, 1863.—This invention consists in providing the car wheels with a friction wheel or band, held in place by a cap or section of the wheel, bolted to the other section, so as to secure the band, and yet admit of its free revolution in turning curves.

Claim.—The application to railroad car wheels of friction wheels or bands of wrought or cast iron, or any other suitable metal, and of any desired thickness, which will prevent friction in turning curves, by the independent revolutions of said friction wheels or bands, in the manner substantially as described.

No. 37,270.—LEWIS F. BETTS, of Albion, Calhoun county, Mich.—*Improvement in Chimney Caps.*—Patent dated January 6, 1863.—The object of this improvement is to secure a passage for the volatile results of combustion, under unfavorable circumstances, by the addition of flues which cause the wind from above to add to the current of the air within, and expel the smoke, &c., at the cowl.

Claim.—The peculiar arrangement of the two flues B B in combination with the openings or inlet passages X X, "guide plate" D and cowls E E, substantially in the manner and for the purposes specified.

No. 37,271.—D. G. BLUE, of Winfield, Iowa.—*Cultivator.*—Patent dated January 6, 1863.—In this invention the forward plough-stocks are made longer than the rear ones, and the draught so applied as to relieve the horses from the weight of the front of the plough. By the employment of removable shield, roller, and plough-stock, in the centre of the implement, it is adapted for use either as an ordinary cultivator or a corn plough.

Claim.—First, the rear posts, when made shorter than the front ones, in combination with the use of an adjustable draught connexion, substantially as and for the purposes set forth.

Second, the combination of the guage runners *d d* with the front posts, substantially as and for the purposes stated.

Third, the combination with the frames of the removable shield box G, plough H, and roller I, substantially as set forth.

No. 37,272.—WILLIAM BOEKEL, of Philadelphia, Pa.—*Moulding Chilled-iron Projectiles.*—Patent dated January 6, 1863.—In this invention the chill is formed of a bottom piece, recessed at the top to receive a ring, composed of four segments, over which is placed the upper chill. The ring serves to make the annular groove by which the missile is attached to the metal. The sand flask rests on the upper chill. The sand mould is surmounted by a top piece having two holes, through which pins are inserted, one forming the gate for the molten metal to flow in, the other forming a vent for the air to escape, as the metal enters the mould. The ring in the bottom chill must consist of segments, so as to allow its being taken off after the missile is moulded.

Claim.—The described mode of moulding chilled-iron projectiles, when the sand mould employed in combination with a chill for any convenient number of castings is formed by means of the moulding irons E and F, and their appendages, substantially in the manner and for the purpose set forth.

Also, the employment of the ring *b* or its equivalent, in combination with the main body of the chill, for the purpose described.

No. 37,273.—L. F. BRONNUM, of Brooklyn, N. Y.—*Improvement in Canteens.*—Patent dated January 6, 1863.—The object of this invention is to produce a wooden canteen without unnecessary bulk or weight. It consists of two concave pieces cemented together and secured by a flanged hoop encircling their edges and fitting in grooves therein. The inner edges of the cheek pieces are grooved and receive a gasket or packing of any suitable material, to prevent leakage. The mouth-piece is screwed in.

Claim.—First, a canteen formed of concave cheek pieces of wood, attached together with a suitable packing or gasket at *b* to keep the joints water-tight, as set forth.

Second, a metal band surrounding the joints, in combination with the aforesaid cheek pieces, for the purposes and as specified.

No. 37,274.—WILLIAM F. BURDEN, of Troy, N. Y.—*Improvement in Rolling-Mill Stands, &c.*—Patent dated January 6, 1863.—In this rolling mill there are three rollers, the middle one fixed, and the others adjustable vertically; the invention consists in the method of supporting and securing them in their positions; the middle roller bears on arches which span the journals of the lower rollers and rest upon projections on the frame; the bearing upon the upper side of the middle roller journal is pressed down by set screws, which project through the upper piece of the main frame; above this bearing the lower seats or bearers of the upper roller journals are suspended by rods, and a bearing above said journals keeps them down; the lower rollers are supported by bearings actuated by screws through the sill-piece of the frame.

Claim.—First, in a rolling mill which has its middle roller fixed and its top and bottom rollers adjustable, the manner substantially as described of applying the screws E E, for the purpose of holding down the middle roll bearing *a'*.

Second, in a rolling mill which has its middle roller fixed and its top and bottom rollers adjustable, the arrangement of the screws H G and E with the top roller bearings *d f*, and upper bearing *a'* of the middle roller, substantially in the manner described.

Third, the combination of the bearings I, screws J, spur wheels K, pinions L, and key shafts M, with the bottom roller, substantially in the manner as described.

Fourth, in a rolling mill which has its middle roller fixed and its top and bottom rollers adjustable, the use of bearings *a a'* of arch or analogous form, so that the bearings I *d f* may be adjusted within the arch thereof, and thus compactness secured, substantially as described.

No. 37,275.—JOHN W. COCHRAN, of New York city, N. Y.—*Improvement in Percussion Fuze for Explosive Shells.*—Patent dated January 6, 1863.—The shell is of the usual exterior form, but is provided with a chamber at its anterior end, traversed by a hollow striker or piston which has a connexion in its axial tube between the cap on its end and the cavity of the shell; hooked into the screw cap at the point of the shell are wires which extend towards the

rear, and are bent behind the shoulder of the piston; the striker is weakly attached to the screw cap until the piece is discharged, when the inertia of the striker breaks the connexion.

Claim.—First, weakly attaching the striker D to the cap C at the front end of the projectile, substantially in the manner and so as to secure the advantages herein set forth.

Second, the construction and arrangement of the parts C D and F, so that the parts F F shall hook into the cavities C C, in the manner and for the purpose herein set forth.

Third, performing the triple function of first holding the striker directly connected to the front cap of the projectile until the discharge of the piece; second, partially overcoming the inertia of the striker before or in the act of their breakage; and third, absorbing the shock and inducing non-elasticity in the impact of the striker on the rear face of the chamber B, all by the employment of the same wires F F, or their equivalents, arranged and bent as herein shown.

No. 37,276.—JOSEPH H. CONNELLY, of Wheeling, Va.—*Improvement in Lamp Wicks.*—Patent dated January 6, 1863.—This improvement relates to hollow wicks and to the method of constructing them, and is sufficiently described in the claim.

Claim.—First, making a hollow wick for lamps of a folded strip of muslin or other textile fabric, by uniting the edges of the strip by means of a paste or cement, insoluble in the oil or burning fluid which is to be burned by the wick.

Second, inserting in an internally wrapped hollow or tubular lamp wick a strip or strips of porous paper, or raw cotton wrapped in paper, so as to give to the wick the requisite stiffness and shape, while increasing its capillary power.

Third, making hollow or tubular lamp wicks of muslin, linen, or other suitable textile fabric without nap, and filled with porous paper, paper pulp, raw cotton, or other substance possessing the requisite capillary property, substantially in the manner hereinbefore described.

No. 37,277.—JOHN A. DANN, WILLIAM F. DANN, and ISAAC N. DANN, of New Haven, Conn.—*Improved Folding Chair.*—Patent dated January 6, 1863.—The arms have slots in which pins upon the outside of the standards of the chair-back may slide. The seat is supported upon X-shaped legs, and as the latter are collapsed against the seat the back rocks forward on to the seat, the pins traversing the slotted arms.

Claim.—The arrangement of the slotted arms A, the bolts I, and standards F, in combination with the legs B C with the several parts, operating substantially as and for the purpose specified.

No. 37,278.—GUSTAVUS F. DEETKEN, of Nevada, California.—*Improved Apparatus for Extracting Gold from Pyrites.*—Patent dated January 6, 1863.—The pyrites, having been first roasted, is placed in a tight vat, and there exposed to a stream of chlorine gas; it is afterwards washed, and the solution of various chlorides collected and precipitated in carboys.

Claim.—The combination of the several devices and apparatus herein described, and operating substantially as illustrated and explained.

No. 37,279.—JAMES H. COON, of Deposit, Delaware county, N. Y.—*Improvement in Servicing Ordnance.*—Patent dated January 6, 1863.—The charge is deposited in a cradle, which is then elevated to a convenient height and position for loading; the breech of the gun is vibrated downwards, being hung upon trunnions so as to bring the bore in line with the charge; a rammer is then set in motion which drives the charge into the breech; the parts are returned to their original positions, and the piece fired. These operations are performed by machinery, the working of which is continuous and uninterrupted, even during the recoil of the piece and its being pushed in battery.

Claim.—First, the device composed of the two arms, 54. and 55, and the crank rod 56, when combined and arranged in the manner hereinbefore described, and operated by the crank 59, so as to move the rammer 60, for the purpose set forth, and in the manner indicated.

Second, the device composed of the arm 30, and the two arms 34 and 35, the chains 39 and 40, in combination with the rods 66 and 67, and the cradle 75, and the lattice elevator 72, all combined with each other in the manner before described, and operated by the crank rod 28', for the purpose of lowering the forward end of the breech 33, and elevating the cradle 75, simultaneously with each other, as hereinbefore described and set forth.

Third, the combination of these two motions with each other, by means of the machinery hereinbefore described, so as to cause the depression of the breech 33, the elevation of the cradle 75, and the ascent of the rammer 60, simultaneously, together with all the minor and subsidiary operations, as hereinbefore described and for the purposes set forth.

No. 37,280.—SAMUEL H. DUBOIS, of Buffalo, N. Y.—*Improvement in Railroad Car Axles.*—Patent dated January 6, 1863.—From the under side of the truck is a dependent post supporting a journal-box, and into this are socketed the balls at the inner ends of the pair of axles.

Claim.—Forming a ball-journal on the inner end of each pair of axles, in combination and arrangement with an appropriate journal-box, having a central support upon the track, for the purposes and substantially as described.

No. 37,281.—M. B. DYOTT, of Philadelphia, Penn.—*Improvement in Coal Oil Burners*.—Patent dated January 6, 1863.—The burner consists of two parts; the upper one being raised and lowered inside of the lower by means of a partial rotation, causing pins on the outer cylinder to traverse slots in the spiral arms which project downwards from the upper piece containing the cone and chimney.

Claim.—A lamp burner constructed of two parts, A D, connected together by slotted spiral arms G, and pins *d*, arranged substantially as shown and described, to admit of the raising and lowering of the part D, cone E, and chimney, for the purpose set forth.

No. 37,282.—T. F. ENGLEBRECHT, of New York, N. Y., and R. BOEKLEN and M. STAEBLEN, of Brooklyn, N. Y.—*Improvement in Artificial Legs*.—Patent dated January 6, 1863.—The improvements consist in the arrangements for adjusting the length and shape of the limb and foot to the requirements of the user; in the articulation of the ankle joint whereby it is made to approximate the natural motions; and in the use of corrugated sheet metal for the rigid or permanent parts. The lower portion of the leg is adjustable vertically, slipping telescopically into the calf and retained by set screws. The instep is stuffed and padded to the requisite proportion and covered with a laced flap. The ball of the ankle is socketed to the lower end of the leg, and retained by a screw bolt suspended by a strap from a transverse rod, allowing a moderate "play" by the deflection of the strap. A modification of the ball and socket may be made, in which a ball on the end of the leg enters a screw socket on the foot, keeping the rigid parts from contact and having the intervening space occupied by an elastic membrane.

Claim.—First, the combination of the two pieces B and C, which form the exterior of the lower leg, substantially as herein described for the purpose set forth.

Second, the construction of the artificial foot with a cavity *m n*, in the place occupied by the instep of the natural foot, and with flaps F, and a lace *n*, or their equivalent, to receive and confine a packing *p*, substantially as and for the purpose herein described.

Third, the construction of the ankle joint with a ball and socket, or cup and spring, combined to operate substantially as herein described, and dispense with the use of stops or other bearings than the ball and its socket or cup.

Fourth, the construction of the joint of an artificial limb in such manner substantially as illustrated in Fig. 7, that the rigid parts connected by the joint do not lap over each other, but leave the opening between them protected by a surrounding spring.

Fifth, the construction of the rigid portions of an artificial limb of plate metal, having corrugations, the length of which runs lengthwise of the limb, substantially as and for the purpose herein specified.

No. 37,283.—JAMES W. EVANS, of New York, N. Y.—*Improvement in Railroad Car Springs*.—Patent dated January 6, 1863.—This machine consists of a number of groups of circular springs superimposed in a box with diaphragms between, and of a smaller diameter and increased number as they ascend in the series, so that the lower ones shall first be impressed by the load. Each group is arranged upon a collar on the diaphragm below it, and when unimpressed by the load is in a plane, but assumes under the imposition of weight the circular segmental form of the rigid surfaces of the diaphragm pistons and the box in which the series or groups of springs are contained.

Claim.—First, the peculiar form and construction of the intermediate un-elastic plate *c*, as regards the progressively increased length of lip in each, according to the number of springs in each group, and the ogee recess *c''*, near the angle.

Second, suspending and holding the elastic plates together at the centres and edges without fixed fastenings, as described.

Third, the combining and arranging the box or cover D with the other parts so as to hold together the whole as a complete spring with or without a bolt, and without any fixed fastenings of the working parts.

Fourth, the combining and arranging the elastic and non-elastic plates, with the above described manner of hanging the elastic plates loose at their centres, thereby rendering fracture or tearing of the plates almost impossible.

No. 37,284.—THOMAS FARRINGTON and LEWIS WHITE, of Washington county, Vt.—*Improved Wringing Machine*.—Patent dated January 6, 1863.—This is a device for bringing the end of an adjustable spring to bear upon the journals of the upper roller in a wringing machine; the ends of the U-shaped spring being wrapped around the end of a rod which passes through both standards of the machine, and is adjustable therein by thumb-screws.

Claim.—The thumb-screws F, the rod B, the slot *c*, the spring A, and the adjustable bearing E, arranged in the manner and for the purpose herein set forth and described.

No. 37,285.—GEORGE FEATHERSTONE, Ansable Forks, Clinton county, N. Y.—*Improved Curriers' Knife*.—Patent dated January 6, 1863.—The invention consists in placing the cross handle with its axis perpendicular to the surface of the blade.

Claim.—The combination of the cross handle *c* with the blade *b*, having upon it one or more double-cutting edges, when said handle is arranged with its axis perpendicular to the surface of the blade, or nearly so, as herein specified.

No. 37,286.—WILLIAM FINLEY, of Schoolcraft, Kalamazoo county, Mich.—*Improvement in Seeding Machines*.—Patent dated January 6, 1863.—The improvements consist in a suspended distributing box below the hopper and feed roller, which is provided with inclined chutes for the grain to roll upon in its descent; and also in the manner of engaging and releasing the driving wheel and feed gear of the seeder, which is by a loose collar, working endwise on the shaft, and with four arms protruding between the spokes of the wheel into a disk plate on the end of the hub.

Claim.—First, the box H, suspended underneath the seed box F by a central pin or bolt i, and provided with the inclined chutes h, as and for the purpose specified.

Second, the sleeve L, provided with the loose collar M and bars P, in combination with the fixed perforated plate o and ratchet pulley Q, all arranged as and for the purpose herein set forth.

No. 37,287.—CHARLES GOODYEAR, jr., of New York, N. Y.—*Improvement in Boot and Shoe Soles*.—Patent dated January 6, 1863.—The invention consists in imbedding in a vulcanized rubber shoe sole a piece of wire cloth, to give form and rigidity to the article.

Claim.—As a new manufacture, boot and shoe soles and parts of soles composed of vulcanized India-rubber, or other vulcanizable material, and wire cloth, or its equivalent, substantially as herein described.

No. 37,288.—WILLIAM K. GREEN, jr., of Amsterdam, Montgomery county, N. Y., and WM. M. PAWLING, of Hagaman's Mills, Montgomery county, N. Y.—*Improvement in Machines for Drying and Finishing Tubular Knit Fabrics*.—Patent dated January 6, 1863.—The claim fully explains the invention.

Claim.—First, the combination or arrangement together for conjoint use of an open hollow support for the tubular web, an apparatus for producing a blast of air, and a device for progressively drawing the tubular web from the said hollow web holder, substantially as herein described, whereby the tubular web may be progressively dried by a blast of air from the inside, in the manner herein set forth.

Second, the combination of a hollow web holder, an apparatus for producing a blast of air, a device for progressively drawing the tubular web endwise from the said web holder, and an internal web expander, substantially as herein described, whereby the tubular web may be progressively stretched transversely and lengthwise, and simultaneously dried by a blast of air from the inside, in the manner herein specified.

Third, the combination of a suitable support A for the long piece of washed tubular web, a pair of compressing draught rollers E E', and an internal web spreader E, of a flattened form, and arranged with its rear end g, Fig. 3, in the bight of the said draught rollers, substantially as herein described, whereby the tubular web may be progressively stretched flat widthwise and lengthwise, and compressed or calendered in such expanded condition, as herein set forth.

Fourth, the herein described arrangement of a flat web spreader E, in combination with calendering rolls E E', a hollow web support A, and a blower C, whereby the tubular web may be progressively dried and simultaneously stretched flat widthwise and lengthwise from the inside, and calendered while thus expanded, as herein set forth.

Fifth, the arrangement in combination of a support A for the long tubular web, a flat web spreader F, a pair of compressing draught rollers E E', and an incumbent take-up roller I, substantially as herein described, whereby the tubular web may be progressively stretched transversely and longitudinally, and calendered and wound into a roll in such expanded condition, as herein set forth.

Sixth, the arrangement in combination of a device C, for producing a blast of air, a hollow web holder A, a flattened web spreader F, draught rolls E E', and an incumbent take-up roller I, substantially as herein described, whereby the tubular web can be simultaneously dried and stretched laterally from the inside, and compressed and wound into a roll in such expanded condition as herein specified.

Seventh, the arrangement of friction wheels o o on the web expander F, combined with a web support A and draw-off mechanism E E', substantially as and for the purpose herein described.

No. 37,289.—W. H. GWYNNE, of White Plains, Westchester county, N. Y.—*Improvement in the Manufacture of Illuminating Gas*.—Patent dated January 6, 1863.—The invention consists in obtaining gas by the usual machinery from wood and highly charged bituminous coal, placing the coal in the back part of the retort and the wood in front, then closing and luting the joint. Proportions, thirty pounds of coal to one hundred of wood.

Claim.—Obtaining illuminating gas from coal and wood placed together in a retort, in manner and proportions and treated substantially as described.

No. 37,290.—WILLIAM HALL, of Brookline, Norfolk county, Mass.—*Improvement in Locks*.—Patent dated January 6, 1863.—This lock is operated by a key with adjustable bits, which, on being introduced into the keyhole, operate a corresponding number of studded key slides, so as to adapt each of them to receive the opening or recess of the corresponding

tumbler in the throwing of the bolt. This latter motion is effected by the knob working by its projection or cam within a recess in the bolt. A bent lever latch catches into notches in the tumbler, to hold them in position during this operation. The latch is operated by the bolt slide L. The bits on the key are made reversible, end for end, in the forked frame, and thereby a greater number of changes afforded. An auxiliary bolt is previously withdrawn from the channel *t*, in which the key slides traverse; and in case of tampering with the lock by pressure on the slides, a projection on the auxiliary bolt enters a notch on the slides, allowing a little play, to prevent picking the lock by the tentation method.

Claim.—The combination and arrangement of one or more studded key slides N N, a corresponding number of tumblers K K, and catch lever M, and the auxiliary slide L, or its equivalent, the whole being applied to the main bolt substantially as specified.

Also, the arrangement and application of the main bolt B with its key slides N, tumblers K, catch lever M, and slide L.

Also, the combination and arrangement of the auxiliary bolt O and its actuating apparatus (or retracting spring and system of levers operated by the knob) with one or more studded key slides N N, a corresponding number of tumblers, a catch lever M, and a slide L, combined with the main bolt.

Also, the combination and arrangement of the tooth *z* and the notches *a2*, or mechanical equivalents therefor, with the auxiliary bolt and its system of key slides.

Also, the application of the auxiliary bolt to its supporting lever or to the lock, so that the said bolt and either of the key slides, when in engagement, may be capable of being moved together in manner and under circumstances substantially as specified.

Also, the key as constructed, with its bits separately revolvable on a pin, in order that either extremity of each bit may be employed in operating a key slide.

No. 37,291.—L. P. HARADON, of Independence, Buchanan county, Iowa.—*Improvement in Grain Distributors.*—Patent dated January 6, 1863.—This invention consists of an inclined telescopic tube, to be attached to the discharge spout of an elevator, by which the stream of grain can be discharged into any of a series of openings communicating with bins or chambers. These openings are in line, and, as the tube is prolonged or contracted, it is brought vertically over the opening to the proper bin. This motion of the tube is given by a chain and pulleys extending to the lower floor.

Claim.—First, the telescopic tube A, provided with the box C, and placed on an inclined framing B; which has a series of spouts D attached, in combination with the cord or chain E attached to the box C, and a windlass provided with a ratchet I and pawl J, or an equivalent device for drawing up the box C in line with the several spouts D, all arranged as and for the purpose specified.

Further, the valve L, in combination with the two inclined spouts C' C'', and the cord or chain N, arranged with the pulley O, loaded arm P, and the loaded lever M, as and for the purpose specified.

No. 37,292.—HENRY HISE, Ottawa, of La Salle county, Ill.—*Improvement in Gauge Cocks.*—Patent dated January 6, 1863.—This improvement consists in the application to a water-gauge cock of a collar, on which is placed a glass tube in which a ball valve of light material floats on the surface of the water; when the water in the boiler sinks below the valve-seat the ball settles thereon, almost hidden from the sight of the engineer, but is plainly visible in the tube at the proper height of water.

Claim.—The attachment of a glass tube to the column B B, in combination with the valve D and floating ball I, when applied to a cock, substantially as and for the purpose herein specified.

No. 37,293.—ANSELL N. KELLOGG, of Baraboo, Sauk county, Wis.—*Improvement in Printers' Press.*—Patent dated January 6, 1863.—This machine is designed as an improvement in the machine known as Newbury's Mountain Jobber and Card Press, patented July 5, 1859, and consists in improvements in delivering the printed cards or sheets, levelling the platen more readily and firmly, and effecting a more perfect distribution of ink upon the ink-roller. These parts are described in the claim with great particularity.

Claim.—First, the method of delivering the printed work substantially as follows: By the removal of the parts specified above as obstructing the free descent of the printed work, the spreading of the arms *a a* of the platen A, the lengthening of the joint-rod *b*, the inversion of the stop-arm *c*, and the construction of the hinge *e* in said arm *c*, the position and shape of the frisket bearers *g g*, the position of the frisket screws *h h*, of the springs *c c*, and of arms P P, the use of screw connexions at the ends of the rod *i*, and the flap *m*.

Second, the apparatus for piling, wherever used, substantially as shown and described, to wit: The box *k*, with lip *l*, and throat *n*, the adjustable back *o*, and raised edge *v*, the fly *p*, arms *g g*, shaft *r*, crank *t*, rod *w*, wrist *y*, and pivot *z*.

Third, the arrangement for levelling and holding the platen A, substantially as shown and described, to wit: The use of the shouldered screws *w w*, and the caps F F', with their fastenings G G' G' G'.

Fourth, the placing of the point of draught of the roller-frame forward of the centre, effected substantially as follows, to wit: By the use of the pivots I and the bar *m*, in the positions shown.

No. 37,294.—SAMUEL LEE, of Taunton, Bristol county, Massachusetts.—*Improvement in Tobacco-Cutters*.—Patent dated January 6, 1863.—This machine is constructed for cutting tobacco, squeezing corks, and cracking nuts, and consists of a lever whose jaws impinge upon the corresponding recesses on the upper edge of a vibrating arm, underneath which are a knife and nut-cracking arrangement.

Claim.—The machine or slicer as constructed either with the cork-squeezing jaws or the nut-cracking jaws, or both, arranged and combined with the levers and stand, applied in manner and so as to operate together, substantially as specified.

No. 37,295.—WILLIAM LECHLER and J. K. SCHUPP, of Cleveland, Cuyahoga county, Ohio.—*Improvement in Mould-Boxes for Casting Propeller Wheels*.—Patent dated January 6, 1863.—The propeller blades, having to assume in their relative positions the form of a screw, are moulded separately in boxes, which are afterwards suitably connected for a casting to be made of the complete propeller with its blades.

In the separate mould-boxes is a mould-block whose face is worked to correspond with the side of the pattern to be used, the pattern being the counterpart of the blade; the mould-block giving the position and inclination of the pattern in the mould so as to come together to its fellows with the right pitch.

Claim.—Making the mould-box for casting propeller wheels in sections A A A A, substantially as described, each section to correspond to a wing or blade of said wheels, which sections, when fitted together with the moulds in them, will constitute a complete mould for a solid propeller wheel, substantially in the manner described.

Also, in combination with the mould-box for a propeller wheel as herein described, the mould block or bed D, substantially in the manner and for the purposes herein set forth.

No. 37,296.—HENRY LEIBERT, of Norristown, Montgomery county, Pa.—*Improved Composition for Gunpowder*.—Patent dated January 6, 1863.—The proportions vary for different purposes. That for blasting may consist of prussiate of potash, two parts; chlorate of potash, one part; nitrate of soda, or other nitrous oxide, ten parts; sawdust or charcoal, four parts; sulphate of soda, one part; sulphur, four parts; quicklime, one part; sal ammoniac, two parts.

Claim.—Prussiate of potash, chlorate of potash, nitrate of soda or its equivalent, sawdust or its equivalent, sulphate of soda and sulphur or its equivalent, substantially as and for the purpose herein set forth.

No. 37,297.—JOHN MADDEN, of Youngstown, Mahoning county, Ohio.—*Improvement in Saw Sets*.—Patent dated January 6, 1863.—The object is to obtain a set of a peculiar character, in which the tooth is not merely deflected to an angle with the plane of the saw-blade, but receives a sharp deflection at the base of the tooth, and then resumes its original direction. This is accomplished by making the working edge of the upper or moving die of an outline to correspond with the desired set; and the anvil or lower die of two pieces, one lower than the other, over the joint between which the tooth is deflected, and again assumes upon the lower one its original line of direction.

Claim.—First, the male die G, in combination with the female dies J J' and M, when constructed and operating substantially as and for the purpose set forth.

Second, the peculiar form or shape of the teeth as shown in Fig. 7.

No. 37,298.—JOHN MARCHBANK, of Lansingburg, Rensselaer county, N. Y.—*Improvement in Printing Floor-Cloths, &c.*—Patent dated January 6, 1863.—The improvement consists in the preparation of a cell box, whose cells are charged with the appropriate colors, into which projecting pins of the printing block are dipped and transferred to the cloth.

The cells are filled by plates having movable pins, which are arranged to agree with the pattern, one plate to a color, and the pins dipped in color and then introduced into the cells discharging their paint therein—the pins being distributed in the plates by means of a perforated card.

Claim.—First, the printing of designs or patterns on oil and other floor-cloths by means of blocks provided with pins or projections arranged at such a distance apart and used in connexion with a box containing cells supplied with different colored paints or with a pad or cushion supplied therewith, substantially as herein described.

Second, the feeders or devices for supplying the cells or the pad or cushion H with the necessary colors, the same being composed of plates E E' E'' E''' provided with pins d, substantially as set forth.

Third, the perforated card or paper D as a means for disposing or distributing the pins d in the plates E E' E'' E''', so as to supply the cells b of the box B, or the pad or cushion with the several colors, that they may be taken up by the blocks to print the desired design or pattern.

No. 37,299.—HENRY MESSER, of Roxbury, Norfolk county, Mass.—*Improvement in Air Engines*.—Patent dated January 6, 1863.—In this single-acting engine the pump piston is stationary, and the pump cylinder has a vertical reciprocating motion to help the descent by

its weight. Within the stationary cylinder is a working piston, under which the heated air is admitted to raise it; upon this is a pump cylinder which, as it is elevated, causes the stationary pump piston relatively to descend, forcing the air contained in the pump cylinder through the pump piston head and the pipe connected therewith to the heated air jacket which surrounds the cylinder and the furnace, and from which the latter is supplied with air.

The space above the piston is in the meanwhile being supplied with exterior air by a valve. On the descent of the working piston and pump cylinder the air above the stationary piston is driven through the piston head as before described. Suitable induction and eduction valves are provided in a chamber with a removable cap to afford access thereto.

Claim.—First, the combination with a stationary pump piston of a pump cylinder attached to and having a reciprocating movement corresponding with the working piston, substantially as and for the purpose herein specified.

Second, the arrangement of the valve chest H, valves I J, and the movable front plate u of the chest, whereby provision is made for getting at the valves substantially as herein described.

No. 37,300.—DANIEL MILLS, of Paterson, Passaic county, N. J.—*Improvement in Window-blind Fastenings.*—Patent dated January 6, 1863.—This fastening is intended to hold in any position the slats of a Venetian blind shutter. The connecting bar is secured by an eyelet to each of the slats excepting one, to which it is attached by a hinge, one leaf of which is on the bar and the other on the slat; the pintle of this hinge is a thumb-screw, and clamped by it the slats are all held firmly.

Claim.—The combination and arrangement of the adjustable hinged fastening *a b d* with a window blind, substantially as and for the purpose described.

No. 37,301.—S. G. MORRISON, of Williamsport, Lycoming county, Pa.—*Improvement in Lamps.*—Patent dated January 6, 1863.—By means of a conducting wick of smaller sectional area than the flame wick, the supply of oil carried to the latter is diminished.

Claim.—The distributing tube B, with the composite wicks C C C, and flame wick *d d*, in connexion with the conducting wick A *a*, so as to lessen the amount of oil raised by capillary attraction to the flame, the amount of wick exposed to the oil reservoir being about one-third of that supplying the flame, the whole constructed and operating substantially as specified.

No. 37,302.—THOMAS NORTHEY, of St. Mayhew Parish, Cornwall, England.—*Improvement in Trunk Engines.*—Patent dated January 6, 1863.—This invention consists in the construction of the inductive and eductive valve by which the steam is admitted to the cylinder on that side of the piston on which the trunk is situated, and, after it has produced a stroke of the piston by its direct action on that side, to pass to the opposite one and produce the return stroke by the expansive action on the larger area of the latter side, producing a uniform development of power in both motions by the proportionment of the respective areas.

Claim.—The combination with a trunk engine of a valve G, applied and operating substantially as and for the purpose herein specified.

No. 37,303.—OSCAR B. OLMSTEAD, of Rockton, Winnebago county, Ill.—*Improved Sugar Evaporator.*—Patent dated January 6, 1863.—A smaller furnace is placed alongside of the main furnace, with its bottom on a lower level, so that the coals falling through the grating on to the false bottom of the main furnace may be raked into the auxiliary furnace and there utilized.

Claim.—First, the combination of the auxiliary furnace E with the main furnace A, when arranged and operating as described for the purpose set forth.

Second, constructing the main furnace A with a double bottom, substantially as and for the purpose specified.

No. 37,304.—STEPHEN R. PARKHURST, of New York, N. Y.—*Improvement in Machinery for Feeding Carding Engines.*—Patent dated January 6, 1863.—This table is a rotary wire-toothed cylinder, which receives the wool, carries it to the toothed roller, which passes it upon the table and thence to the picking cylinders, which revolve slowly and open the knots and bunches preparatory to their being removed by the "licker-in" to the carding engine. Any fibre which may have dropped during this operation is brought back to the revolving table by the endless apron which revolves beneath.

Claim.—First, the cylindrical rotary feeding table *g*, to supply the fibrous material to the cleaning or carding machine, substantially as specified.

Second, the roller *l*, in combination with the said cylindrical rotary feeding table *g*, for the purpose and as specified.

Third, the belts *p p*, screen *r*, and curved guard *s*, in combination with the said cylindrical rotary feeding table *g*, for the purposes and as specified.

Fourth, a series of toothed cylinders, in combination with the toothed feeding table, for opening, combining, and separating the fibres, as specified.

No. 37,305.—JAMES L. PLIMPTON, of New York, N. Y.—*Improvement in Skates*.—Patent dated January 6, 1863.—In this improvement the roller blocks are so attached to the foot-stand by downwardly projecting pintles that, as the foot is canted over in the act of turning the body, the plates in which the lower ends of said pintles are journaled throw the pintles out of the parallel line of direction and cause the rollers to follow a curved track agreeing to the bodily motion. The broad tread of the foot is fastened to the foot-stand by upcurved plates which embrace the edges of the sole, and these are operated by a spring under the boot sole, which forces them forward and keeps them engaged with the front edges of the slots.

Claim.—First, the attaching or applying of the rollers E, or runners E^o, to the stock or foot-stand A of a skate in such a manner that said rollers or runners will be turned, cramped, or adjusted, so as to run the skate in a curved line to the right or left by the turning or canting of the foot stand, or stock A, as set forth.

Second, the plate H H, provided with hooks g at their ends, and racks f at their front edges, in combination with the spring I and plate G, the latter being applied to the stock or foot stand A, and provided with slots e at its ends, and all arranged as shown to form a fastening at the front part of the skate, as herein shown and described.

No. 37,306.—JOSEPH F. SARGEANT, of Boston, Mass.—*Improvement in Eyeletting Machines*.—Patent dated January 6, 1863.—This machine consists of arrangements by which eyelets thrown promiscuously into a hopper are properly arranged, presented to the work, and placed therein in readiness to be clinched; or, not assuming the proper presentation, are rejected and discharged. Also, in the arrangement of those portions of the sets which operate on the ends of the eyelets, with reference to the fulcrum of the levers carrying the sets. The details of the machinery by which these objects are accomplished are minutely described in the claim.

Claim.—First, the combination of a hopper with two side bars and cover and a vibrating bottom, constructed, arranged, and operating substantially as specified.

Second, the under-cut formation of the sides of the chute provided with the guard or deflector and a depression in the side boundary of the chute when arranged and operating together substantially as and for the purpose specified.

Third, the arrangement of those parts of the sets which operate on the ends of the eyelets relatively to the pivots or fulcrums from which the sets are vibrated substantially as described.

Fourth, in combination with a hollow set, a feeder having a point or points suitable for entering into an eyelet or eyelets, and motions forward and backward for the purpose of feeding, and motions toward and from the eyelets for the purpose of engaging with them; said combination operating to place successively and at the proper time one eyelet after another on the hollow set, and at all other times in conjunction with the set to prevent the eyelets from being placed thereon.

Fifth, the combination of a punch with an eyelet set, so that the punch will operate to form holes in advance of the place where the set operates and to space the distances between the holes substantially as described.

No. 37,307.—JOHN C. SCHOOLEY, of New York, N. Y.—*Improved Refrigerator*.—Patent dated January 6, 1863.—The object of this invention is to regulate the relative sizes of the provision chamber and ice chamber for convenience, and to economize the ice; this is accomplished by sliding the movable partition on horizontal cleats which project into grooves at the edges of the partition.

Claim.—The movable partition C, when used in combination with a refrigerator, and so arranged that the partition can be moved to and fro, substantially as and for the purposes as set forth.

No. 37,308.—SAMUEL J. SEELY, of Brooklyn, N. Y.—*Improvement in Machines for Bending Corrugated Sheet Metal*.—Patent dated January 6, 1863.—In a suitable frame three rollers are journaled, and corrugated to correspond with the pattern of the sheet. The upper roller is so superimposed upon the other two as to form the corrugated plate into a cylindrical shape by its passage between them.

Claim.—Bending corrugated sheet metal into the form of a cylinder which is corrugated around its circumference by means of three adjustable rollers having corrugated circumferential surfaces such as described, said surfaces meshing into one another and also revolving in concert and with an equal and positive motion, all substantially as herein set forth.

No. 37,309.—DANIEL S. STAFFORD, of Decatur, Macon county, Illinois.—*Improvement in Cultivators*.—Patent dated January 6, 1863.—There are two pairs of ploughs in this cultivator suspended from the frame by bolts which allow of their swinging back and forth; the drawing chains attached to a forward part of the machine pass over pulleys and connect the ploughs in pairs, so that if one meets with a detention the other will pull forward sufficiently to permit the former to ride over the obstacle. Also, the machine is so hinged to the tongue and hounds that by tilting the rear end up, the ploughs are all removed from the ground.

Claim.—The suspended and dually-connected arrangement of single ploughs in combination with each other and with a wheeled carriage so as to operate substantially as described.

Also, in combination with the suspended and connected arrangement of ploughs in pairs, so constructing and arranging the carrying frame thereof that it may be inclined by the driver so as to operate substantially as specified.

No. 37,310.—JOHN B. STRICKLER, of Milford, Iroquois county, Ill.—*Improvement in Bee-hives*.—Patent dated January 6, 1863.—This hive consists of two main divisions, the hive proper and the upper apartment for the honey boxes, which are three in number. The lower division is divided by vertical partitions into three apartments, the middle one the largest, and a space is taken off the lower part of this for a drawer which contains a frame, and a slotted slide for the entrance of the bees. In one of the honey boxes bait may be placed to entrap the queen bee and remove a colony. Sliding rods cross the main chambers for the attachment of the combs.

Claim.—The arrangement and combination of the drawers E F G with the compartments K L M, drawer P, slotted or perforated slide O, and frame Q, all arranged within the case A to form a new and improved bee-house, as herein set forth.

Also, the bait receptacle I in the drawer G, in combination with the compartment J, for the purpose of entrapping the queen and removing the surplus colony from the bee-house, as herein set forth.

Also, the sliding comb-supporting rods R, arranged as shown, for the purpose specified.

No. 37,311.—HENRY THOMASON, of Lafayette, Tippecanoe county, Ind.—*Improvement in Seeding Machines*.—Patent dated January 6, 1863.—These improvements relate to the attachment of the shares to the frame and to the method of constructing the seed-distributing disks of metal which are slit and the sections turned so as to make spiral or oblique flanges. The various parts involved are minutely described in the claim.

Claim.—First, attaching the shovels or shares J to plates *w* fitted loosely, or pendent rods *e** attached to the plates K of the frames in which the seed-boxes are secured in connexion with the plates K, having the plates *w* connected to them by rods *f**, and the former secured to the beam *a*' of the frame A, all arranged as and for the purpose of turning the shovels or shares, as specified.

Second, the manner of constructing the seed-distributing wheels *q*, as described, to wit: by cutting slits in circular disks and bending the portion of the disks between the slits obliquely with their shafts so as to form buckets or flanges to act upon or raise the seed and discharge the same from the seed-boxes, as set forth.

Third, securing the plates *v* of the shovels or shares J to the plates *w* by means of joints *a**, substantially as shown, in connexion with the staples *b** and wooden pins *d**, and the slots *c** in the plates *v*, all arranged to operate as and for the purpose herein set forth.

No. 37,312.—WILLIAM G. TUTTLE, of Geneva, Ontario county, N. Y.—*Improvement in Saws*.—Patent dated January 6, 1863.—The improvement in this saw consists in the dress of the teeth, which are formed of pairs, resting together with a narrow slit between them, alternating with straight, single, clearing teeth. The teeth constituting the pair are set one each way so as to form the kerf.

Claim.—The use of alternate triangular pairs of cutting teeth *a a'*, separated individually by the narrow slit *b*, and with their points resting closely together, in combination with the intermediate, single, straight, clearing teeth *d*, the whole arranged on a single saw blade, and operating substantially as and for the purpose herein set forth.

No. 37,313.—SYLVANUS WALKER, of Boston, Mass.—*Inkstand and Pen-rack*.—Patent issued January 6, 1863.—Antedated July 6, 1862.—This invention consists in the special arrangement of parts by which the interior is made to serve as a fountain inkstand, while the outside, besides the dipping and filling orifice, has projections and channels for holding pens.

Claim.—First, a fountain inkstand and pen-rack combined, all made of one piece of glass.

Second, in combination therewith the horizontal grooves *a b c*, reservoir B, dipping-cup A, convex-bottom E, neck C, aperture *e*, and hood *f*, when combined and arranged as described for the purposes set forth.

No. 37,314.—A. WARNER, of Cleveland, Ohio.—*Improved Composition for Lemonade*.—Patent dated January 6, 1863.—Two pounds loaf sugar, one ounce oil of lemon, one pound tartaric acid, three ounces citric acid; bottle for use.

Claim.—The herein described compound, consisting of loaf-sugar, oil of lemon, tartaric acid and citric acid, prepared and combined substantially as and in the proportions herein set forth.

No. 37,315.—RANDALL MILTON WHIPPLE, of Cambridge, Mass.—*Improved Shoe Brush*.—Patent dated January 6, 1863.—From the end of the back of the brush there projects a scraper consisting of a piece of bent metal adapted to remove the thick dirt from boots. This is retracted against the end of the brush by means of a pin which works in a slot in the back and passes into the plate which slides in a space between the two pieces which form the back.

Claim.—The combination of the scraper with the brush, constructed and operating substantially as herein described.

No. 37,316.—JOHN ZENGELER, of Chicago, Ill.—*Improvement in Chimney Attachment for Lamps*.—Patent dated January 6, 1863.—In this lamp, the platform on which the chimney rests is tilted back by a thumb-piece and thrown completely out of the way while fixing the burner or lamp; underneath the thumb-piece of the platform is a spring which bears upon a friction roller in the act of turning.

Claim.—The combination of the friction roller *e* with the pivoted arm *b*, spring clamp B, and curved spring H, all constructed, arranged and employed in connexion with the lamp top A, in the manner and for the purposes herein shown and explained.

No. 37,317.—WILLIAM F. COCHRANE, of Springfield, Ohio, assignor to Himself and WARDER & CHILD, all of same place.—*Improvement in Bolting Flour*.—Patent dated January 6, 1863.—The object is to avoid the difficulty of rebolting flour from which the offal has been withdrawn, and this is accomplished by gradually increasing the fineness of the successive cylinders, the flour from each of which is conducted to a separate receptacle, and the offal fed from bolt to bolt. Certain grades are required, and, being mixed with offal, are again passed through the process, which is all assisted by a blast of air from a fan, and regulated by valves.

Claim.—First, bolting the meal over a series of reels covered with cloth of increasing fineness, in combination with a blast, substantially in the manner described.

Second, running the offal through the entire series of reels substantially in the manner described, for the purpose of making the flour bolt more freely.

Third, re-bolting the "white middlings" flour after re-grinding and mixing them with offal, substantially in the manner described.

Fourth, conducting the flour made upon each reel into a separate compartment, substantially in the manner described, for the purpose of making a variety of grades, or of mixing them in any proportion desired, as set forth.

No. 37,318.—WILLIAM F. COCHRANE, of Springfield, Ohio, assignor to Himself, WARDER & CHILD, all of same place.—*Improvement in Bolting Flour*.—Patent dated January 6, 1863.—The improvement consists in driving a blast of air, hot or cold, according to the necessities of the case, into the interior of the bolting cylinder, so as to keep the gum on the meshes of the bolting cloth free from moisture, and consequently from clogging; the air being afterwards conducted to a condensing chamber for the deposit of the fine flour before it is returned to the fan again; the fine flour escaping by a valve into the bolt again, the strength of the blast being controlled by valves in the air-pipes, and the amount of warm air returned to the fan being determined by a cast-off valve in the down-cast trunk.

Claim.—First, returning the blast air to the fan, substantially in the manner and for the purposes described.

Second, regulating the quantity of warm air returned to the fan by means of a cast-off valve in the return air-trunk, for the purposes set forth.

Third, controlling the strength of the blast by means of valves in the air-pipes, substantially in the manner and for the purpose described.

No. 37,319.—WILLIAM F. COCHRANE, of Springfield, Ohio, assignor to WARDER & CHILD, of same place.—*Improvement in Bolting Flour*.—Patent dated January 6, 1863.—The improvement has reference to the "pump," so called, by which the flour to be bolted is fed into the reel by the reciprocating motion of a plunger or shovel, which is intended to feed in the meal without allowing the air to escape. The plunger is constructed with steps, so as to feed from the bottom of what meal is in the spout to prevent packing, which is likewise assisted by having a flaring feed-spout. The length of the connecting rod of the plunger may be varied so as to regulate the amount of feed, according to the character of the grain, the state of the atmosphere, &c.

Claim.—First, feeding the meal to the bolting-reel by means of a pump, for the purpose set forth.

Second, making steps or off-sets 1 2 upon the plunger of the pump, for the purpose set forth.

Third, the combination of the plunger *d* and screw-rod *d*3, substantially in the manner described, for the purpose of regulating the amount of feed to the reel.

Fourth, the combination of a flaring feeding-spout with a pump, substantially in the manner described, for the purpose set forth.

No. 37,320.—WILLIAM F. COCHRANE, of Springfield, Ohio, assignor to WARDER & CHILD, of same place.—*Improvement in Bolting Flour*.—Patent dated January 6, 1863.—This invention has reference to the parts of the reel and valves and passages, by which the meal is passed consecutively through the required operations, and the various results of the process conveyed to their appropriate receptacles; these results are accomplished by constructing the blast reel, which revolves in the cylindrical bolt, with hollow perforated arms, which create a blast impinging immediately upon the meshes of the bolting cloth. To secure a means of conveying the meal into the bolt, the inner disk of the head is made stationary with a spout projecting through it, and the flanged rim of the revolving head runs with a groove on the

stationary central disk. The third point is fully explained in the claim. The fourth refers to the same device. The flour is conveyed to the conveyor by a rotating valve or pump, which prevents the escape of air. The sixth point is another expression of the same device. The seventh, eighth, and ninth, relate to the peculiar construction and adjustable parts of the rotating valve beneath the bolt cylinder, by which the flour and offal respectively are passed to their appropriate places without allowing the leakage of air.

Claim.—First, the combination of the reel-shaft E, bell-mouthed air-chambers E4, and reel-arms E1, with the perforated tubes E3, as and for the purpose described.

Second, the combination of the stationary reel-head e, revolving ring e1, and flanges e2 e2, when constructed and arranged as herein described for the purpose set forth.

Third, forming a dead-air chamber at the tail end of a bolting-reel into which the offal may fall, and thus be prevented from specking or mixing with the superfine flour, and preventing the flying dust from the flour chamber from passing into the offal, substantially in the manner herein described.

Fourth, the combination of a dividing-board or partition E7 and flanged ring e1, with a bolt-reel, substantially as described for the purpose set forth.

Fifth, conveying the fine flour from the bolting-reel to the conveyor or other receptacle by means of a valve or pump F, which passes the flour freely, but prevents the escape of air, substantially in the manner described.

Sixth, the combination of the reel E, valve shaft F, and conveyor N, substantially in the manner described.

Seventh, the combination of the valve shaft F, base-boards f', and adjustable concave blocks f, as described.

Eighth, the combination of the slotted shaft F', reciprocating board or plunger f2, channels f, and brackets f4, substantially as described.

Ninth, the combination of a pump trap or cut-off with the dead-air chamber E9, substantially in the manner described for the purpose of discharging the offal therefrom.

No. 37,321.—WILLIAM F. COCHRANE, of Springfield, Ohio, assignor to WARDER & CHILD, of same place.—*Improvement in Bolting Flour.*—Patent dated January 6, 1863.—The blast of air that comes from the reels is charged with fine flour, which is passed to the collecting and condensing chamber before it is returned to the fan, that the flour may be deposited upon the floor of said chamber, and returned by the revolution of the valve to the bolt.

Claim.—First, the condensing or collecting chamber H, when constructed, arranged, and operating as described, for the purpose specified.

Second, the combination of a collecting chamber H and valve I, substantially in the manner herein described, for the purpose set forth.

Third, the combination of a collecting chamber, a valve, and a bolting-reel, substantially in the manner and for the purpose described.

No. 37,322.—CHARLES HOWELL, of Cleveland, Ohio, assignor to PETER HANNAY, of Washington, D. C.—*Improvement in Machine for Pulverizing Quartz, &c.*—Patent dated January 6, 1863.—In this machine the ore is introduced between a rapidly revolving disk and an enclosing case. The edge of the disk is armed with teeth or projections, and violently projects the ore against the stationary case, and thus shatters it.

Claim.—Reducing minerals, bones, and similar substances to powder by percussion, substantially as described; that is to say, by means of a rotating projector and an impinging surface, both enclosed in a case; the relations of the rotating projector and the impinging surface being such that the materials will not be pulverized by being crushed between them, but only by the percussion resulting from the sudden checking of the motion given to the materials by the one against the surface of the other, substantially as described.

No. 37,323.—DELAPHIN MCDANIEL, of New Castle, Del., assignor to Himself and J. MCCULLOCH, of Cecil county, Md.—*Improvement in Packing Sheet Metal for Transportation.*—Patent dated January 6, 1863.—Making the two exterior sheets larger than those contained between them and lapping the former over the latter as an envelope.

Claim.—Making one or both of the two outside sheets larger than those between them, and bending over the edge so as to form a box or covering of the two outside sheets to protect the sheets between them.

No. 37,324.—J. D. MERRIAM, of Ashburnham, Worcester county, Mass., assignor to E. W. VAILL, of Worcester, Mass.—*Improved Folding Chair.*—Patent dated January 6, 1863.—Of the curved X-shaped pieces which form the legs two are prolonged, and these furnished with a cap-piece constitute the back. The legs are suitably connected with each other by rounds, and the frame is provided with a flexible seat.

Claim.—As a new article of manufacture, a folding chair composed of curved pieces A A and D D, rounds or cross-bars E B B F, flexible seat G, back piece H, and connecting bar C, combined and arranged in the manner and for the purpose specified.

No. 37,325.—EDMUND LUCKOW and EDWARD HABEL, of Oldham, Lancashire, England, assignors to CHARLES LUCKOW, of Buffalo, N. Y.—*Improvement in Blowers*.—Patent dated January 6, 1863.—English patent, February 25, 1862.—This blower consists of a revolving conical hub with spiral flanges thereon rotating in a cylinder with wings or flanges projecting inwardly and having a spiral direction agreeing with that of the wings or flanges on the revolving hub. Fastened to the cylinder is a conical or bell-shaped chamber, in which one journal of the blower is stepped, receiving the wind from the blower and discharging it by the orifice into suitable conducting tubes.

Claim.—First, the arrangement and combination of an archimedian screw with a cylinder having catch wings *a'* upon the inside thereof, for the purposes and substantially as described.

Second, placing and using the blades of an archimedian screw upon a conical and bill-mouthed hub, for the purposes and substantially as set forth.

Third, the combination of the conical disk E with the cylinder A and archimedian screw, for the purposes and substantially as set forth.

No. 37,326.—HORACE C. WHITTIER, of Plymouth, Mass., assignor to Himself and JOS. L. BROWN, of same place.—*Portable Writing Apparatus*.—Patent dated January 6, 1863.—This consists in a folding cylinder divided longitudinally by a joint, one-half being a box and the other half its cover, which, when opened, exposes at one end of the case an ink-stand, while the rest of the space is occupied by a roll, which forms, when extended, a writing tablet. This tablet is composed of an elastic material with a backing of slats, which, brought into a plane by the junction of their edges, form a level surface and support for the writing paper.

Claim.—Improved portable writing apparatus, as made, with its folding tablet D, and the body or main part A, and cover B, of its case A2, arranged and applied substantially in manner and so as to operate as represented and described.

No. 38,327.—JOHN AIKEN, of Warner, N. H.—*Improved Cheese Press*.—Patent dated January 6, 1863.—The end pieces of the press are secured to a bed piece or platen G, to the top of which are four sets of levers *b b b b*; to the upper end of these are hinged other levers *c c*, whose lower ends are hinged to cross-pieces D beneath the platen G; to the upper ends of the levers *c c* are connected cords E, which wind on a windlass F.

Claim.—The particular combination and arrangement of the levers *b b b b b b b c c c c*, B, platen G, with the cords or ropes *e e e e*, and beam F, substantially as set forth.

No. 37,328.—JACOB AUTENRIETH, of Philadelphia, Pa.—*Improved Eyelet for Lacing Shoes*.—Patent dated January 6, 1863.—The improvement consists in the construction of a projecting eyelet, through which the string may be passed without being clamped between the boot and foot.

Claim.—As an improved article of manufacture, a lacing eyelet made with a tubular projection or prongs *a a'*, disk *b*, and eye *e*, as herein shown and described.

No. 37,329.—FORDYCE BEALS, of New Haven, Conn.—*Improvement in Rammer Connexion for Revolving Fire-arms*.—Patent dated January 6, 1863.—The invention consists in an arrangement of a bar which is pivoted immediately below the barrel, and which retains the axis pin in position with the rammer lever, which, secured by its catch, fastens the pivoted bar to its place.

Claim.—The combination of the pivoted bar G, constructed as set forth, with the axis pin C and the rammer lever D, substantially in the manner herein shown and described.

No. 37,330.—JOHN T. BEVER, of Springfield, Sangamon county, Ill.—*Improvement in Operating Churns and Washing Machines*.—Patent dated January 6, 1863.—The object of this invention is to apply power derived from the dancing or plunging motion of the body to such operations as churning, washing, &c. The operator sits on a seat, and by a surge of his body depresses the lever, and the return motion is given by a spring. To the under side of the lever a bar is attached which may actuate a churn-dasher or a disk washing rubber, the latter being rotated by cords in the hands of the party or by the feet.

Claim.—The stand A, post *c*, lever B, post C, bar D, and spring E, arranged substantially as shown for the purposes herein set forth.

Also, in combination with the parts above named the seat F on the lever B, and the foot springs L L on the platform *a*, as and for the purpose specified.

Also, the foot-piece *f* on bar D, in combination with the hand-rod *g*, when said parts are used in connexion with the lever B, post *c*, and stand A, for the purposes specified.

No. 37,331.—CHEVALIER GAËTAN BONELLI, of Milan, Italy.—*Improvement in Delineating Telegraph*.—Patent dated January 6, 1863.—In this improvement the message is set up in metallic type or written with metallic ink upon non-conducting paper, or with an insulating ink upon conducting paper, and placed in the circuit, and is copied by electricity upon chemically prepared paper at the station to which it is sent.

Claim.—The employment, for producing the image of types or handwriting, of a number of conducting wires, when combined with two series of flexible, comb-like, metallic teeth or

elastic conductors, arranged nearly close together, but insulated from each other, and with a movable platform or platforms carrying the conducting types or handwriting, and the chemically prepared paper on which the image is to be produced, the whole operating substantially as herein specified.

No. 37,332.—JOHN G. CHAPMAN, of Charlestown, Middlesex county, Mass.—*Improvement in Machine for Drawing Bolts and Spikes*.—Patent dated January 6, 1863.—A frame consisting of side pieces and a bridge or cap is set over the article to be drawn, having a screw-shaft extending down, and at its lower extremity a foot-piece with its upward edge inclined towards the shaft; this foot-piece sets between a pair of jaws, and as the screw-shaft is rotated, and the foot-piece raised, the lower edges of the jaws are clamped against the spike, and it is raised out of its bed.

Claim.—The within described machine for drawing bolts, consisting of the combination of the frame A, the screw-shaft B, with its foot-piece D, and the jaws E, arranged and operating as set forth.

No. 37,333.—J. S. CLOUGH and J. N. BUNNELL, of Brooklyn, N. Y., and Unionville, Hartford county, Conn.—*Improvement in Tool Handles*.—Patent dated January 6, 1863.—This invention consists in applying an India-rubber cushion or pad to the head of a tool handle, or the but, as it is often called, which comes in contact with the heel of the hand, to prevent bruising and blistering.

Claim.—In combination with the tool handle, the India-rubber cushion, applied as shown for the purpose specified.

No. 37,334.—A. CUSHING, of St. John, Province of New Brunswick.—*Improvement in Sawing Machines, for Edging, Slitting, and Re-sawing Lumber*.—Patent dated January 6, 1863.—The feed table and the platform upon which the attendant stands are moved simultaneously, so that he has but to attend to the presentation of his work to the saw, and the trouble of walking in following up his work is dispensed with.

Claim.—The combination of the feed table E, and stand or platform G, connected together, or so arranged as to be operated simultaneously as and for the purpose herein set forth.

No. 37,335.—A. CUSHING, of St. John, Province of New Brunswick.—*Improvement in Saw-Mills*.—Patent dated January 6, 1863.—In this machine the logs in the "round" or squared are passed between pressure rollers above and below to the gang-saws, and the devices have reference to the means of feeding them and of bringing an equality of pressure under all the varying sizes and shapes of the same. The lower feed rollers run in permanent bearings and the upper ones hang vertically over the lower ones by arms from a shaft over the centre. Besides their own weight, upon the journal bearings of these upper rollers there are pitmen and racks working in pinions on the frame overhead.

Claim.—First, feeding or operating the upper or pressure rollers of gang-saws by a combination of means which will make them always work effectively and automatically upon all sizes and varieties of round logs with variable surfaces as well as flat timber, substantially as shown or by an equivalent arrangement.

Second, the lower feed rollers D D having their shafts E fitted in stationary bearings in combination with the upper yielding and adjustable rollers M M, when the same have their shafts N fitted in arms O connected to sliding frames Q Q, arranged with the racks *a* and pinions *b*, and both pairs of rollers operated through the medium of the gearing I' H G G L U U, as and for the purpose herein shown and described.

No. 37,336.—C. H. DE FOREST, of Birmingham, New Haven county, Conn.—*Improvement in Hooped Skirts*.—Patent dated January 6, 1863.—This improvement is adapted to that class of hooped skirts in which loops are woven on the supporting tapes to sustain the hoops, and consists of a clasp which is placed upon the intersections of the hoops and the tapes by which they are caused to maintain their relative positions.

Claim.—The employment of the clasp C or its equivalent, in combination with the hoops and pockets *a* of the hoop-supporting tapes, for preventing the displacement or derangement of the hoops in the pockets, substantially as hereinbefore described.

No. 37,337.—ELIAS DOHNER, of Lancaster, Pa., and A. M. BRUCKHART, of Brunnersville, Lancaster county, Pa.—*Improvement in Water Wheels*.—Patent dated January 6, 1863.—Within the space between the rim and the hub and between the usual buckets of the turbine are shorter buckets, following the same shape, intended for the more perfect utilizing of the percussive force of the water.

Claim.—The combination of the short intermediate buckets D with the buckets C, hub A, and rim B, all constructed and arranged in the manner and for the objects set forth.

No. 37,338.—THOMAS DOWLING, of Salem, Essex county, Mass.—*Improvement in Hot-air Registers*.—Patent dated January 6, 1863.—The improvement consists in the arrangement

of the pipes, &c., whereby a stream of cold air from the room is mingled with the heated air escaping from the hot-air pipe before its delivery into the room; the tubes which project into the room slip telescopically within each other so as by elevation to induce a current of heated air, and to be depressed out of the way when not in use.

Claim.—The combination and arrangement, substantially as described, of the case A, the tube F, and the perforated collar D, with the floor C, and its register J, and the hot-air inlet pipe B, whereby one or more air passages are so formed between the floor and hot-air pipe B as to cause, while hot air may be blowing out of the pipe B and from thence through the register, a current of cool air to flow downward through the collar D, and the passage between the case A and the tube F, and thence upward through the said tube F and the register, and commingle with the heated air discharged from the pipe B.

Also, the combination of one or more telescopic tubes H I with the register *d*, the case A, the tube F, and the inlet pipe B, the whole being so as to operate substantially as described.

No. 37,339.—F. D. DRAKE, of Four Corners, Huron county, Ohio.—*Improved Evaporator for Saccharine Liquids.*—Patent dated January 6, 1863.—The improvement consists in the arrangement of the furnace and flue under the evaporating pan in which it extends under the front side, then returns under the centre, and back again under the rear portions of the pan to the chimney, so that the heat is graduated from the front to the rear, and the scum is thrown to the coolest part of the pan to be removed.

Claim.—The arrangement of the flue *c* extending on one side of the furnace A, from front to rear end, then back through the middle to the front end, and back again to the chimney at the rear end of the furnace, in combination with the pan B, constructed and operating substantially as and for the purpose shown and described.

No. 37,340.—WILLIAM H. FIELD, of Taunton, Bristol county, Mass.—*Improvement in Machines for making Shoe Nails.*—Patent dated January 6, 1863.—The nail-plate passes through a furnace, which retains it at a suitable heat for the operation as it is fed continuously to the cutter.

Claim.—The employment or use of a furnace E in combination with the cutter A of a shoe-nail machine, and with the feeding tubes D, constructed and operating substantially in the manner and for the purpose specified.

No. 37,341.—CARLTON FOSTER, of Oshkosh, Winnebago county, Wis.—*Improved Device for Canting or Turning Logs during the Process of Sawing them into Lumber.*—Patent dated January 6, 1863.—In this device a crane is elevated above the log, and from it depends a chain and block with hook attached, the latter to be hooked under the log to cant it over; the chain returning passes over pulleys and to a shaft under the floor worked by the engine or other power, being connected or detached by levers working friction pulleys.

Claim.—The hook Q attached to a tackle, the chain L of which is connected in an adjustable shaft F', operated through the medium of friction pulleys or wheels D E thrown in and out of gear, or connected and disconnected by means of levers G H, so arranged that the former one G will have its fulcrum *a* in line or in the same plane with the tension or strain of chain L on shaft F', substantially as and for the purpose set forth.

No. 37,342.—W. R. GREENLEAF, of Silver Creek, Chautauque county, N. Y.—*Improvement in Valve Gear of Steam Engines.*—Patent dated January 6, 1863.—This invention consists in operating the two induction and eduction valves of a double engine by a single eccentric, and of shifting the eccentric for the purpose of varying the stroke and reversing the movement. The shaft is provided with a single eccentric, and upon this is a ring to which the valve rods are attached; when they are at half-stroke they are at the same relative angle as the cylinders. Behind the eccentric is a disk concentric with the axle, with slots in its face in which tongues on the eccentric work to reverse the action of the valves. This motion of the eccentric is accomplished by an inner eccentric, fast upon a sleeve which is loose upon the crank shaft and operated by suitable means.

Claim.—The combination and arrangement of the valves, valve stems or valve rock-shafts, and of the two eccentric rods *c c*, attached to the same eccentric, substantially as herein described, whereby the one eccentric is made to operate the valves of both cylinders of a double engine, as herein set forth.

Also, the employment for operating the inner eccentric D of two sleeves H I, the one moving around, the other sliding longitudinally upon the crank-shaft, the two combined by a spiral groove *i* and pin *j*, and the whole operating substantially as herein specified.

No. 37,343.—L. M. HILLS, of New Haven, Conn.—*Improvement in Steam Radiators.*—Patent dated January 6, 1863.—This steam radiator consists of an upper and lower chamber, joined by tubes properly luted with an unyielding cement to the plates into which they pass.

Claim.—The combination of the tube plates H and I, the tubes C, and plates E and F, when the same are constructed and joined with unyielding joints, in the manner and for the purpose substantially as herein set forth and described.

No. 37,344.—ABRAHAM HUFFER, of Hagerstown, Md.—*Improvement in the Combination of Steam and Water Power.*—Patent dated January 6, 1863.—This machine is intended to utilize exhaust steam from an engine necessarily employed in other work, by employing it to produce a vacuum by condensation, to raise a body of water to turn a wheel. For this purpose two or more chambers are employed to receive the exhaust steam, and two reservoirs are provided, one below the wheel and the other above it, and the steam is employed to raise the water from the lower to the upper one, which in its descent turns the wheel.

Claim.—The combination of a steam generator or steam generators with a water wheel or water wheels, and chambers or a chamber for elevating water by atmospheric pressure, and driving a water wheel or wheels, substantially in the manner and for the purpose set forth.

No. 37,345.—JOSEPH INGELS, of Milton, Wayne county, Ind.—*Improvement in Grain Drills.*—Patent dated January 6, 1863.—These improvements relate to the method of varying the rate of delivery of the seed by changing the intermediate gear wheels on the movable shaft, the raising of said shaft by the lifting of the hoes stopping the feed. The delivery hoppers of the seed trough are each of them constructed with its concave and sides cast in one piece, and with an inclined plate over the feed wheel. The bottom of the grass-seed box has brackets connecting the adjacent edges, and underneath these slides a gauge plate with apertures more or less covered by the brackets, as may be desired.

Claim.—First, the use of double reversible intermediate gear wheels, substantially as shown and described, to communicate motion at any desired speed from the main axle to the seed delivery apparatus.

Second, the manner of attaching the movable shaft M at any suitable position between the axle *b* and shaft *k*, to adapt it to the different sizes or positions of the intermediate wheels.

Third, the combination of the lever W and flange or cam *u'* with the pivoted bar U and wheel L, to disconnect the said wheel with the shaft *k* by the act of raising the hoes.

Fourth, the concave *j* of the secondary or delivery hopper, cast in one piece with cheeks *j' j'*, all as herein shown and described.

Fifth, the combination of the concave *j*, inclined plate *j2*, cheeks *j'*, and feed wheel K, all constructed and arranged substantially as herein shown and described.

Sixth, the movable bottom or gauge plate G, perforated with tapering apertures *g* in the described combination with the supporting brackets G', so arranged that the said brackets may cover any desired part of the apertures to regulate the delivery of seed, as explained.

No. 37,346.—GEORGE JONES, of Peekskill, Westchester county, N. Y.—*Improved Device for Tightening Window Sashes.*—Patent dated January 6, 1863.—An angle piece is fastened to the window frame, having a face towards the sash; through this face passes a thumb-screw which impinges against a plate attached to the sash, and by means of tightening this screw the sash is retained in position.

Claim.—The combination of the angle pieces C C, thumb-screws D D, and bearing plates *d d*, applied, respectively, to the window frame and sash, substantially as and for the purpose herein set forth.

No. 37,347.—LUKE KAVANAUGH, of Waterford, Saratoga county, N. Y.—*Improvement in Blades for Knitting Machine Sinkers.*—Patent dated January 6, 1863.—This blade is so constructed that in feeding and sinking the yarn into and between the needles in a knitting machine, the yarn, with its knots and large spots, in bending around the needles between the blades, can extend into the openings in the blades so as to leave more room between the blades for the needles, and avoid their binding against each other and bending or breaking the needles, or breaking the yarn by nipping it between the needle and the blade.

Claim.—A wing or blade for sinker-burrs of knitting machines, having through it a hole or opening *b* arranged in respect to a yarn-guide *c* on the blade, substantially as herein described.

No. 37,348.—J. A. LAFLER, of Albion, Orleans county, N. Y.—*Improvement in Brick Machines.*—Patent dated January 6, 1863.—Within the throat or press box of the tempering vat is a piston, operated by a platform below, which vibrates on a central point; the sides of the piston and the inside of the press box are therefore curved to correspond. The floor or bottom of the piston is grated, each slat corresponding to the divisions of the brick mould below, which latter is projected up into the press box by the elevation of the platform on which the mould lies pushing the piston before it. The mould is formed of parallel sides and ends, the partitions between the bricks extending down into the bottom board so as to separate the loose pallets which lie under the bricks, and upon which they are removed when the frame is raised and the bricks are left to be carried off.

The ends of the mould box are recessed to correspond with projections from the bottom board to serve as guides for the adjustment of the parts of the mould box.

Claim.—First, the combination of the curved and yielding clod-crusher F with the press box E and the mould G, in the manner herein shown and described.

Second, the combination with the pallets *q* and bottom board *r* of the bevelled side pieces *m* and the bevelled division pieces *o* of the mould box G, when the said side pieces are arranged to extend below the level of the pallets, all in the manner and for the purpose herein shown and described.

Third, the construction of the edges *n n* of the mould box *G* with recesses *s s*, in combination with the projections *t* upon the boards *r*, all as and for the purpose herein shown and described.

No. 37,349.—ALMON LEACH, of Utica, N. Y.—*Improvement in Coal-oil Lamps*.—Patent dated January 6, 1863.—This improvement is designed to render the burner detachable without interfering with the original plan of the lamp, patented by Wordin and Leach, July 23, 1861, and consists of a longer and a shorter cylinder *H* and *K*, with an annular perforated plate *J* connecting them, the whole secured to the burner, and the outer cylinder fitting into the jacket *D*.

It further consists in double reflectors of concave form, the centre of each being occupied by a convex circular projection.

Claim.—Securing the cylinder *H*, perforated plate *J*, and flange *K*, to the burner *G*, as shown, when said burner is screwed into the tube *B*, and all used in connexion with the cylinder or jacket *D*, for the purposes herein set forth.

Also, the combination of two reflectors *L L*, formed each of concave and convex surfaces *h i* constructed together angularly with each other and placed in relation with the flame of the lamp, as herein specified.

No. 37,350.—JACOB H. LIGHTER, of Freedom township, Carroll county, Ill.—*Improvement in Horse Powers*.—Patent dated January 6, 1863.—The centre pinion of the horse-power which is attached to the tumbling shaft is bevelled each way, and rotated by two horizontal crown wheels, operating upon one above and the other below, meshing with the double bevelled pinion.

Claim.—The application of two horizontal crown wheels *B B* placed on each side of the centre of the horse-power, in combination with a single pinion *D* bevelled each way from the centre, and working between the two horizontal crown wheels *B B*, as and for the purpose substantially as specified.

No. 37,351.—DAVID B. LUCKEY, of Bloomingburgh, Sullivan county, N. Y.—*Improvement in Harvesters*.—Patent dated January 1, 1863.—This improvement is designed for stony and rough ground, and consists in a device for balancing the weight of the cutter bar by weighted levers so that it may be readily raised vertically to pass over an impediment, with a lifting rake in the front of the cutters to raise “down” grass and present it to the cutters for their effective action.

Claim.—First, balancing the cutter bar and finger bar by the weighted levers *b* and *K*, and connecting them to the other means or devices herein set forth, so that when they come in contact with stones or other impediments they will be elevated in a vertical or nearly vertical direction, as described.

Second, in combination with a mower, the lifting rake, arranged and operated in front of the cutters, substantially as set forth.

No. 37,352.—HENRY F. MANN, of Laporte, Ind.—*Improvement in Securing Soft Metal Packing to Projectiles*.—Patent dated January 6, 1863.—In grooves running circumferentially around the ball there are bars which cross from side to side of the groove. Filling this groove is a body of soft metal, which surrounds the circumference of the bars, and is by them securely held to the ball.

Claim.—Providing around the circumference of shot, shell, or projectiles the bars *B B*, which are separated from one another and isolated from the bottom of the packing groove, and which extend from shoulder to shoulder of said groove and pass entirely through the soft metal packing; all in such a manner that the soft metal packing is held securely in place, both longitudinally and in line with the circumference of the projectiles, substantially as described.

No. 37,353.—PATRICK MCGLEW, of Des Moines, Polk county, Iowa.—*Improvement in Seeding Machines*.—Patent dated January 6, 1863.—The improvement consists in attaching behind the rollers, or wide wheels on which the frame is supported, a scraper to clear the dirt from the wheels. It is brought into connexion with the wheels, or detached by a lever and stirrup.

Claim.—The scrapers *H H*, attached to the bar *G*, fitted in guides *g g*, and connected to a lever *J*, the whole constructed, arranged, and operating in the manner and for the purpose herein set forth.

No. 37,354.—CHARLES E. MILLER, of Amelia, Clermont county, Ohio.—*Improvement in Seeders*.—Patent dated January 6, 1863.—This machine consists of a frame, which has underneath, in the advance, a clod-crusher, consisting of a roller with spike teeth, and at its rear a row of harrow teeth. In a position above the frame, and dropping its seed between the clod-crusher and the harrow, is a seed-box with a long slit or orifice beneath, which orifice is fitted with a register to regulate or close the opening.

Claim.—First, the seeding apparatus, consisting of the hopper E, having a long transverse ventage F, closable by the adjustable concavo-convex shield or register G, and supported by the bevelled staples K, in combination with the spiked clod-crushing roller B, arranged and operating in the manner specified.

Second, the described arrangement of the clod-crusher B D, harrow C, and seeding apparatus E F G H I J K L, as and for the purpose set forth.

No. 37,355.—JOHN M. MILLER, of Hamilton, Butler county, Ohio.—*Improvement in Water Wheels.*—Patent dated January 6, 1863.—For the purpose of utilizing the vertical fall of water more thoroughly and avoiding leakage from the buckets, which commences as soon as the horizontal point is passed, the buckets in this improvement are attached to endless chains, formed by gudgeons fitting in eyes, and the chains working upon a central wheel having depressions on its periphery in which the links are retained; by which arrangement the buckets are allowed to descend to the lowest point, and passing around a roller to again take their place upon the wheel and ascend to fulfil their round.

Claim.—First, in combination with the pulleys A and B, an endless chain of buckets C, constructed as described, with overlapping wings F, to prevent the waste of water, the whole operating in the manner and for the purpose set forth.

Second, connecting the said buckets C by gudgeons D', fitting in eyes D, the said parts being located directly over the centre of the buckets when full, and in other respects so arranged that each bucket shall be suspended in a perpendicular position, as explained.

No. 37,356.—JOHN C. NYE, of Cincinnati, Ohio.—*Improvement in Breech-loading Firearms.*—Patent dated January 6, 1863.—This is an attached stud to the rear end of and beneath the key or gate, so that, as the latter is raising for loading, the stud comes in contact with the end of the barrel, withdrawing the plunger about one-tenth of an inch, thus breaking the adhesion caused by firing.

Claim.—The arm G attached to the key or gate C, substantially as described in the specification and shown in the accompanying drawings.

No. 37,357.—MILTON J. PALMER, of Homer, Cortland county, N. Y., and HENRY R. INGALLS, of Groton, Tompkins county, N. Y.—*Improvement in Churn Dasher.*—Patent dated January 6, 1863.—This revolving churn dasher is rectangular, and consists of two arms, into which the journal pins are driven; these are connected at their ends by a couple of concave beaters or half cylinders, and the cylinders again connected by slats placed obliquely to the axis of rotation.

Claim.—The manner of setting the slats *c c* across the dash from float to float, with their side faces at an angle to the plane in which the dash revolves, when used in combination with said floats *a a*, substantially as above described.

No. 37,358.—CHARLES W. PEARCE, of Oakhill, Green county, N. Y.—*Improvement in Coffee and Spice Mill.*—Patent dated January 6, 1863.—This is a double mill, having a double rotary grinder on one shaft, with a hopper so constructed, with a partition and valve, as to direct the contents of the hopper to either side at will, so as to admit of the two sides being used for different purposes.

Claim.—The adjustable plate or valve G, placed in the hopper E, in combination with the double-rotary grinder A, placed within the case C, substantially as and for the purpose herein set forth.

No. 37,359.—WESLEY POWERS, of Preston, Chenango county, N. Y.—*Improved Window Clothes Dryer.*—Patent dated January 6, 1863.—This machine is intended for exposing clothes to dry outside of a window, and consists of an upright bar, stepped into a socket upon the window sill, and held at its upper end by an extension rod between the sides of the window frame. Through mortices in this bar sliding arms, arranged radially, extend out from the window in a fan-shape, and to the end of these arms are bars making them of a T-shape, with cords run around the spindle, and outwardly around the T-shaped heads of the radial rods for the clothes to be hung upon.

Claim.—First, the arrangement of a swivel bar A, secured by means of gudgeons *a a'* to the casing of a window, in combination with sliding arms C, provided with lines *e*, all constructed and operating substantially in the manner and for the purpose herein shown and described.

Second, the combination and arrangement of the swivel bar A, line-carrying arms C, and extension bar B, as and for the purpose specified.

Third, the arrangement and combination of the swivel bars A, line-carrying arms C, and movable stop *g*, as and for the purpose set forth.

No. 37,360.—JOSEPH RECKENDORFER, of New York, N. Y.—*Improvement in Lead Pencils.*—Patent dated January 6, 1863.—This black lead pencil has a different grade of hardness at each end, and a dividing line with indications on each half of the character of the contained lead.

Claim.—The new article of manufacture herein described, viz., a wood-cased black-lead pencil, having different grades of hardness at the opposite ends, and indicating on its exterior the character and the amount remaining of each grade, substantially as above set forth.

No. 37,361.—MICHAEL RITNER, of Vincennes, Knox county, Indiana.—*Improvement in Projectile for Ordnance.*—Patent dated January 6, 1863.—This improvement consists in attaching a vulcanized India-rubber or gutta-percha sabot to a leaden projectile.

Claim.—The combination of a leaden ordnance projectile with a vulcanized India-rubber or vulcanized gutta-percha, or a combination of vulcanized India-rubber and vulcanized gutta-percha wad or sabot, for the purpose set forth.

No. 37,362.—HENRY SIDDAL, of San Francisco, California.—*Improvement in Grain Separators.*—Patent dated January 6, 1863.—The grain is carried up by elevators and discharged into a narrow spout, in the throat of which are distributing-boards which spread it over a larger surface in descending; it is then exposed to an upward blast of air, which carries up all refuse, allowing the heavy grain to descend; the lighter grain and offal are then carried into another chamber, with several partitions, and deposited according to their comparative levity, the very light matters being entirely removed through the blast fan, while the heavier portion of the light grain is returned by a spout to the elevators.

Claim.—First, the spout A, provided with distributing spouts B, as described.

Second, spouts A C, relatively to blast spouts F, when constructed and operating as described, for the purpose set forth.

Third, the arrangement of chamber I, spout K, and elevator W X, for the purpose of returning a part of the grain, as herein set forth and described.

No. 37,363.—JOHN W. SMITH, of Iowa Point, Doniphan county, Kansas.—*Improvement in Beehives.*—Patent dated January 6, 1863.—For the purpose of killing the bee-moth and its progeny, a chamber beneath the hive is provided with salt. A perforated slide adjustable in the front of the hive is used to decrease the size of the bee entrance and permit ventilation. The sides of the hive, which stands on a metallic plate, are chamfered off so as to be shod with V-shaped zinc edges. The inside of the hive is coated with red oxide of mercury and beeswax, and a channel provided for uniting adjacent hives to prevent swarming by enlarging the habitation for future division.

Claim.—First, a metallic platform G, provided with a chamber *d*, in which is placed salt or its equivalent, for the purposes set forth.

Second, in combination with the platform so constructed, the chamfered beehive covered with zinc or other metal, as described, for the purposes set forth.

Third, coating the inside of the hive with a mixture of red oxide of mercury and beeswax, for the purpose described.

Fourth, the combination of the perforated slide G, with the avenue I, for the purposes described.

No. 37,364.—EDWIN A. STEVENS, of Hoboken, N. J.—*Improvement in Operating Ordnance.*—Patent dated January 6, 1863.—The muzzle of the gun is depressed to an aperture in the deck, so that it may be loaded from a lower deck; here, a charge on a vertically vibrating arm is raised by steam-power to a position in line and between the muzzle and the rammer; the rammer under the impulse of a piston in a steam cylinder then rams home the charge; after firing, the sponge is operated by the same means, and a water-pipe is conducted through the sponge block and provided with small ejecting tubes to wet the bore of the gun.

Claim.—First, so depressing the muzzle of a gun that it may be loaded from beneath the plane on which it is placed, through an aperture I in the floor or deck, in the manner and for the purpose substantially as set forth.

Second, the use of a steam cylinder J for loading and sponging a gun, substantially as described.

Third, the employment, in combination with a rammer L, operated by steam power, of a mechanical contrivance O o, substantially as described, for raising the charge and presenting it between the rammer and the muzzle of the gun.

Fourth, the use of a steam cylinder for elevating the charge, substantially in the manner explained.

Fifth, the employment, in combination with means for loading a gun by steam power, of means for injecting water into the bore, substantially as described.

No. 37,365.—EDWIN A. STEVENS, of Hoboken, N. J.—*Improvement in Sighting Guns.*—Patent dated January 6, 1863.—The object of this improvement is to provide means for training guns to a given angle with the axis of the vessel, or to train them on an object while the gunner remains beneath the gun deck. There is attached beneath the deck to the pintle of the pivoted gun, a graduated index plate by which its horizontal bearing may be read. A telescopic tube, with two rectangular bends and with reflecting mirrors at the angles, is so placed as to be used from beneath the deck; two of these may be so situated as to form a base of sufficient length to obtain by simultaneous observation the distance by triangulation. Two screw propellers, working in contrary directions, rotate the vessel so as to bring the guns to bear on the required point.

Claim.—First, the use of a graduated index plate, situated between the gun deck, for pointing the guns of war vessels, substantially as described.

Second, the use of graduated index plates for turning the guns of war vessels, in combination with two screw propellers for turning war vessels, for the purpose specified.

Third, a telescope F f, constructed substantially as described, in combination with a revolving gun-carriage, for the objects specified.

Fourth, the use of two telescopes, constructed substantially as described, for observing from within or below a protected structure the distance and position of an object, for the purpose specified.

No. 37,366.—HENRY H. SWIFT, of Hart's Village, Dutchess county, N. Y.—*Improved Mode of Attaching Chimneys to Lamps.*—Patent dated January 6, 1863.—A wire spring about the circumference of the inside of the burner, but of an oval shape, is attached through holes to the burner. The spring being sprung round, the glass is inserted, and when the spring is released it assumes the oval form and clamps on the shoulder or flange at the foot of the chimney.

Claim.—The spring E, bent or curved in bow form, and applied to the burner A, substantially as and for the purpose herein set forth.

No. 37,367.—LORENZO P. TEED, of White Deer Mills, Union county, Penn.—*Improvement in Shaker Frames for Threshing Machines.*—Patent dated January 6, 1863.—This frame has a longitudinal and vertical motion, and its bottom or floor consists of slats inclined towards the rear; from the forward edges of these slats project forked rods, which, under the impulse of the jerking reciprocating motion of the frame, push forward the light refuse which lies upon the frame while the grain falls down between the slats.

Claim.—A shaker frame having inclined slats E and forked rods d d, arranged and operating substantially as and for the purpose herein set forth.

No. 37,368.—SAMUEL VANSTONE, of Providence, R. I.—*Improvement in Machines for Rolling and Forging Metals.*—Patent dated January 6, 1863.—The object is to form by rolling and forging an article which has to assume a round exterior shape. The metal to be operated upon is placed on a rolling rest and clamped between disks. Shaping rollers, which are simultaneously rotated by gearing, are then brought in connexion with the heated metal, and, revolving by contact between these, it assumes an outline the counterpart of their shape. A hammer suitably operated works upon the upper edge or surface, and the metal is sustained below by an anvil roller.

Claim.—First, the combination and arrangement, as set forth, of the two shaping rollers B B' and the rolling rest or anvil roller D, in connexion with a suitable device for holding the metal while it is being rolled, substantially as herein shown and described, for the purpose specified.

Second, in combination with such arrangement of rollers, a suitable hammer for welding and assisting in shaping that portion of the metal which is being rolled, so that the metal may be rolled and hammered at the same time, substantially as herein specified.

Third, the construction and arrangement of the clamping disks J J, substantially as described for the purpose specified.

No. 37,369.—GEORGE W. WHITE, of New York, N. Y.—*Improvement in Breech-loading Firearms.*—Patent dated January 6, 1863.—This is a method of closing and opening the breech-piece for firing and reloading. A block or breech-pin, having a projection which enters and fits the bore, is first withdrawn toward the rear until the projection is clear of the bore and then depressed so as to leave the rear of the bore open for the introduction of a cartridge. These motions are effected by the partial rotation of a cylinder which works in a vertical slot in the gun-stock behind the barrel, being rotated by an arm which forms the trigger guard, and depressed by a pin fast to the stock which traverses a cam-shaped groove in the cylinder.

Claim.—First, the method of closing the bore by means of a breech-piece, constructed and operated substantially as set forth.

Second, the manner of giving to the breech-piece the two motions described, that is to say, the combination of the said piece with the rotating cylinder by the pin h, substantially as set forth.

No. 37,370.—HEMAN A. ASHLEY, of Springfield, Clark county, Ohio, assignor to WILLIAM RUDENOUR and MAHLON K. BISER, of the same place.—*Improvement in Hay and Cotton Press.*—Patent dated January 6, 1863.—The object of this improvement is to construct a press in which the power exerted may be continuous and in the same direction. This is effected by throwing one or the other of the windlasses into gear with the spur-wheel which is rotated by the lever; in one case operating the toggle joint and bringing a powerful and gradually accumulative force to bear upon the hay, and in the other case withdrawing the followers to admit of the hay-box being recharged.

Claim.—The arrangement of windlasses J J', lever K, pinions I I', spur-wheel H, and cords L L, attached or connected respectively to the toggle M N, and directly to the pistons, in the manner and for the objects stated, when combined with hooks F F' hinged to each other and to the frame and adapted to open and close both doors E E'' at once, in the manner set forth.

No. 37,371.—E. T. FORD, of Buffalo, N. Y., assignor to WALTER A. WOOD, Hoosick Falls, N. Y.—*Improvement in Harvesters*.—Patent dated January 6, 1863.—The improvement consists in the construction in one piece of the yoke and tongue plate, in which is socketed the main axle which forms the pintle on which the yoke is hinged.

Claim.—An independent yoke or seat and tongue plate, cast in one piece, and hinged to the main axle, in the manner and for the purpose substantially as described.

No. 37,372.—JAMES HATFIELD, of Ogden, Henry county, Indiana, assignor to Himself and JOHN WALL, of Falmouth, Indiana.—*Improvement in Fences*.—Patent dated January 6, 1863.—The boards are nailed to vertical slats alternately on either side. A slot in the bottom of the slat sets over a foot piece placed on edge for a support; the two bottom boards of each panel are inserted through mortises in the foot piece, thus locking it fast.

Claim.—The manner of keying the posts to the foot stays or braces by means of the two bottom boards of each panel, as shown and described.

No. 37,373.—RUSSELL B. PERKINS, assignor to PARKER & PERKINS, of Meriden, Conn.—*Improved Tinned Iron Spoons*.—Patent dated January 6, 1863.—This improvement consists in extending the neck of the bowl to form a short flat tongue wide enough, when fully shaped, to partially enclose the handle and made to fit accurately by stamps and dies; a rivet is passed through to secure the two parts, which are then tinned as usual.

Claim.—Joining the handle and bowl of an iron spoon together, in the manner specifically as set forth herein.

No. 37,374.—SAMUEL S. SHERWOOD, of Acquackanonk, Passaic county, N. J., assignor to Self and ALEXANDER DOUGLASS, of English Neighborhood, N. J.—*Improvement in Hooped Skirts*.—Patent dated January 6, 1863.—For each intersection of the suspending tape and hoop a mortised clasp of thin sheet metal is provided; the tape is slipped through the mortise, and the hoop being laid upon it, the ends of the clasp are bent over, embracing both and holding the tape with a half-round and turn.

Claim.—The mortised clasp, constructed as described, in combination with the tapes and loops of the lady's skirt, substantially as set forth.

No. 37,375.—J. E. STURDY, of Augusta, Kennebeck county, Maine, assignor to Himself and C. H. STURDY, of same place.—*Improvement in Water Elevators*.—Patent dated January 6, 1863.—In this elevator the discharging spout is attached to the bucket, and as it rises towards the top a cam, formed of two pieces or lips with a space between, comes in contact with a plate which draws the bucket round to a proper position, a stirrup under the spout is then caught by a hook, tilting the spout down and projecting the nose of it through the hole in the well-curb, and a lever operates a valve in the bottom of the bucket to discharge the water.

Claim.—First, the attaching of the spout I to the bucket D, substantially as shown, in combination with a lever H, and valve G, all arranged in the manner shown, so that said spout may be tilted at the proper time, and the valve raised in order to admit of the water being discharged from the bucket, as described.

Second, the cam N, and lips *h h*, attached to the bucket D, in combination with the pendent plate O attached to the rising and falling bar L, arranged to operate as and for the purpose specified.

No. 37,376.—LEROY S. WHITE, of Waterbury, Conn., assignor to Himself and HENRY A. CHAPIN, of Bridgeport, Conn.—*Improvement in Breech-loading Fire-arms*.—Patent dated January 6, 1863.—The sliding breech-piece works on guides at its forward and rear parts, and is withdrawn from contact with the barrel by depression of the lever guard, which, being attached at its forward end to the sliding breech-piece and to the stationary stock by a link, acts as a toggle to withdraw the breech-piece horizontally. When closed the square end of the link comes against a shoulder of the breech-piece to hold it against the recoil.

Claim.—First, so constructing the sliding breech-piece C and combining it with a non-sliding stock and a non-sliding barrel that its main or body portion is suspended in a space, without being supported by guides or ways, while its front portion *d* and its rear portion *e* are supported by guides. The said rear and front portions *d e* being solid with the body portion, substantially as and for the purpose described.

Second, the combination of the breech-piece C, when made with the parts *d e* solid to it, and the horizontal guides *m n c*, lever guard G, link H, non-sliding barrel A, non-sliding stock B, the whole constructed and operating as described.

Third, the combination of the shoulder *p*, link H, lever guard G, breech-piece C *d e*, stock B B' B2 B3, and play-hole *q*, all substantially in the manner and for the purpose described.

Fourth, the combination of the spring guard G, link H, breech-piece C *d e*, stock B B' B2 B3, and the pins *q q2 q3*, arranged so that they are out of line when the guard is closed, all substantially as and for the purpose set forth.

Fifth, so arranging the dovetail guide *m* that it serves the double function of keeping the mainspring in place and of holding the tail *e* of the breech-piece G in position, substantially as described.

Sixth, the combination of the hammer D and its actuating mechanism with the sliding breech-piece C d e, non-sliding barrel and non-sliding stock, all in the manner herein described.

No. 37,377.—BENJAMIN RHODES, of Old Ford Road Row, Middlesex, England, assignor to JAMES MCGEARY, of Salem, Mass.—*Improvement in Apparatus for the Manufacture of Tubes, Pipes, &c.*—Patent dated January 6, 1863.—Patented in England April 19, 1862.—This machine consists of a tank of melted bitumen with a furnace beneath, in which revolves a mandril in suitable bearing and turned by a crank. Above the mandril is a roller containing paper or other fabric, which is fed down continuously through a slot to the bath of bitumen and wound upon the revolving mandril until the cylinder of bitumenized paper, &c., is of sufficient strength and thickness. It is then taken out and revolved against a polishing cylinder, which, as well as the other cylinders, may be cooled by a circulation of cold water through them; and in place of the mandril, solid at the ends, a cylinder of wire gauze may be employed, upon which to wind the fabric and form the pipe.

Claim.—First, the general construction and arrangement of parts of the machinery or apparatus herein described and as shown in the accompanying drawings, for the purposes set forth.

Second, the use or employment of a perforated cylinder or roller, or a cylinder composed of wire gauze covering, revolving in a bath of bitumen, or its equivalent, for the purpose of insuring the more thorough saturation and coating of the material employment for forming pipes.

Third, the use or employment of cold water circulating through the top pressure roller and the cooling and polishing cylinder of pipe-making machines.

No. 37,378.—NORMAN ALLEN, of West Meriden, Conn.—*Improved Lamp-lighting Device.*—Patent dated January 13, 1863.—This invention consists of an oil chamber and a long wick tube, by means of which a lamp may be lighted without removing the chimney.

Claim.—The combination of the chimney or receptacle A, tube B, and wick C, all arranged substantially as shown and described to form a new and improved article for the purpose specified.

No. 37,379.—JOSEPH H. ATWATER, of Providence, R. I.—*Copying Press.*—Patent dated January 13, 1863.—The object of this invention is to provide a portable box copying press with an adjustable platen to suit the varying thickness of the copying book or paper.

Claim.—A box copying press, for the purpose of taking a copy of writing and for the protection and safe-keeping of the copying book, as herein described.

No. 37,380.—BENJAMIN T. BABBITT, of New York, N. Y.—*Improved Armor Plates for Ships and other Batteries.*—Patent dated January 13, 1863.—The invention consists in a peculiar dovetailed construction of the parts forming the armor plating, by an arrangement of bars laid crosswise, and cast metal filling.

Claim.—Having the bars B C made in wedge form and combined in the manner shown with the bars A and the cast metal filling, all as set forth.

No. 37,381.—JASON T. BARTLETT and EDWARD E. BUTMAN, of Boston, Suffolk county, Mass.—*Improvement in Trusses.*—Patent dated January 13, 1863.—This improvement consists in the adjustment of the pad to its position, and securing it there by means of a ball and socket joint with temper screws and an arm projecting from and secured to the spring.

Claim.—The arrangement of the two screws D E with the ball and socket of the pad and its arm C, substantially as specified, the arm being applied to its spring by devices to admit of its adjustment, substantially as explained.

No. 37,382.—EDWARD and JOHN BOURNE, of Pittsburg, Penn.—*Improvement in Steam Generators.*—Patent dated January 13, 1863.—This improvement consists in the application of a vertical rod with short levers attached, one operating on the fire door and the other on the ash-pit door, so as, by its upward motion, to open the feed door and damp the fire, and by its downward motion to open the ash-pit door and blow the fire, the rod being actuated to these movements by attachment to a lever and rod and elastic head in the steam chamber, and by its elevation to help raise the safety-valve when necessary.

Claim.—The combination and arrangement of the short levers T and K and rod W with the elastic head r in the chamber C, substantially in the manner and for the purposes as herein set forth.

Also, assisting the safety-valve to rise when necessary by means of the rod W acting against the lever H that holds the valve down for the purpose of enabling the steam to escape, as herein set forth.

No. 37,383.—FRANCIS S. BURT, of Mount Pleasant, Henry county, Iowa.—*Improvement in Pumps.*—Patent dated January 13, 1863.—This pump consists of a reciprocating piston

working in a submerged chamber in the well, and so arranged in combination with a sliding valve that at each throw of the valve it uncovers the ingress opening and discharges at the egress, the valve moving by the pressure of the water as the piston is moved.

Claim.—The combination of the piston D and the slide valve H, working in separate compartments E G in the pump chamber A, in connexion with the tube B and the water passage I in the side and top of the chamber A, and the induction openings $g\ g\ g\ g'$ in the side of the said chamber, all being constructed and arranged as and for the purpose herein set forth.

No. 37,384.—JOHN G. CHAPMAN, of Charlestown, Middlesex county, Mass.—*Improvement in Boring and Squaring Off Cylinders.*—Patent dated January 13, 1863.—This tool consists of an eccentric cylindrical cutter head hung upon an arbor between the centres of a lathe, to be rotated inside the cylinder to be operated upon. The cutters are set radially in the cutter head, and an annular sleeve on one end of the cutter head has a projection which prevents it from rotating, and pins are set in the periphery of the cutter head, which, as they come in contact with said projection, rotate the cutter head on its arbor, which continues to move, and by the screw within feeds the cutter head along longitudinally. By means of a slide at the end of the arbor rest, the tail screw is set eccentrically with the arbor to the necessary degree. The squaring-off tool is placed at the end, and its feed movement is radial, by sliding cutter heads operating within the recess of the face plate wheel, pinion, and screw through the shank of the cutter head.

Claim.—The cylinder, or cutter head, or stock E, with eccentric F attached, in combination with the ring G, placed on the eccentric, and having its periphery provided with pins n and the nut B, fitted within the ring, and connected with the ring G through the medium of the slot or groove m and roller l , the above parts being fitted on the arbor A as shown, and all arranged to operate as and for the purpose herein set forth.

Also, the cylinder H, with the eccentric U, having the ring T fitted on it with pins r attached, in combination with the plate I, provided with the toothed rim Q, the screw shaft O, gears P P, and cutter slides K K, all arranged substantially as and for the purpose set forth.

Also, the socket W, when arranged with a slide Y, containing the hole v for the centre point, as shown; but this is claimed only when used with the implement or tools herein shown and described.

No. 37,385.—GEORGE COMINGS and LOUIS MENSING, of New York, N. Y.—*Improvement in Machines for Manufacturing Chenille.*—Patent dated January 13, 1863.—The gimp and the two threads which are to form the warp are wound upon their respective rollers, and are so placed by guides that, as the weft of the gimp is cut by the knife, one of the warp threads of the chenille is above and the other below the gimp, clasping the threads, while the original cords on which the gimp was wound pass away to a reel or otherwise. The two warp threads being twisted, the embraced gimp assumes its spiral character.

Claim.—The combination of a cylinder H and knife L with devices for conveying the gimp and thread, substantially as herein shown and described.

Also, having the gimp arranged and carried upon cords f , as herein set forth, so that chenille in pieces of any desired length may be produced as set forth.

No. 37,386.—FRANKLIN M. CROSSETT, of Piermont, Rockland county, N. Y.—*Improvement in Door Latches.*—Patent dated January 13, 1863.—The invention consists in making a loop on the inner end of the door latch, with a bevelled surface at its end, upon which a sloping projection on the spindle works by simply pulling, thus retracting the latch within the case.

Claim.—The loop D, formed at the inner end of the latch B, and provided with the bevelled end or surface c , in combination with the projection d on the sliding spindle E, all arranged substantially as and for the purpose herein set forth.

No. 37,387.—HENRY G. DAVIS, of New York, N. Y.—*Improvement in Crutches.*—Patent dated January 13, 1863.—This handle is adjusted vertically by a thimble and set-screw in the shaft of the crutch, and is on the outside.

Claim.—An adjustable handle E, constructed and arranged to serve, in connexion with the staff, as and so as to realize the advantages herein set forth.

No. 37,388.—ANDREW J. EDDY, of Brooklyn, N. Y.—*Improvement in Moulds for Casting Shells.*—Patent dated January 13, 1863.—This improvement consists in the employment of a shouldered metal bush around the core, to support it independently of the sand of which the mould is formed, to prevent the displacement of the core. The core bar and metal bush are made fast to the bed piece.

Claim.—The metal bush or collar H, constructed and applied in combination with the flask B, bed piece A, and core bar E, substantially as and for the purpose herein specified.

No. 37,389.—J. P. DRIVER, of Marengo, Iowa.—*Improvement in Machines for Casting Bullets.*—Patent dated January 13, 1863.—A series of mould blocks, each carrying a hemispherical depression in each of its faces, are attached to an endless band or chain, and are

thus fed under a spout by which melted lead is poured into them. From this they pass to a roller, which, as it slightly sways the apron up, partially opens the moulds, whose upper edges have a depression which connects the gates of the moulds, and the lead in this depression forms a "sprue" which is removed by the cutter, leaving the bullet clean. As the endless band passes over the roller at its point of descent, the moulds are opened and the bullet taken out by a picker.

Claim.—First, the employment in casting bullets of an endless series of moulds carried by one or more endless belts or chains, or connected together to form an endless chain, by whose movement around two drums the moulds are opened and closed, substantially as herein specified.

Second, the combination with the endless series of moulds of a knife or knives, applied substantially as herein described, to cut off the sprues of the bullets.

Third, the roller G, applied in combination with the endless series of moulds, substantially as and for the purpose herein specified.

Fourth, the toothed springs *i i*, applied in combination with the endless series of moulds, and operating as herein specified.

Fifth, the combination of the endless series of moulds, the roller G, the melting pot E, the knives *e e e*, and the toothed springs *g g g*, the whole arranged and operating substantially as herein described.

No. 37,390.—HENRY H. ELWELL, of South Norwalk, Fairfield county, Conn.—*Improvement in Locks.*—Patent dated January 13, 1863.—The object of this invention is to so construct a lock that it may be made to answer for a right or left-hand door by inversion, and in both cases admit of the key being introduced in a proper position; that is to say, bit downward. The bolt of the lock consists of the usual square-projecting stud, and has a wide plate, with an opening into which the key is inserted. The interior edge of this opening is of such a shape as to receive the impact of the key introduced in either position, and the bolt is retained when thrown by duplicate tumblers, which are so pivoted together as to act simultaneously when one is lifted by the bit of the key in the act of locking.

Claim.—The plate D, with bolt C attached, and provided with the opening E, in connexion with the tumblers H H and keyhole F, arranged substantially as and for the purpose herein set forth.

No. 37,391.—GEORGE ESTERLY, of White Water, Walworth county, Wis.—*Improvement in Harvesters.*—Patent dated January 13, 1863.—The improvements consist in the form and construction of the frame of the machine. The side of the main frame is straight towards the platform, and angular on the off side, being connected to the draught frame by a hinged plank, and also by a draught chain which passes over a windlass under the driver's seat. From the front end of the main stem extends a short sill, to which is suspended, by bolts and eyes, the finger bar. The point of the gatherer at the end of the finger bar is adjustable vertically by a slotted arc, a beam, and set-screw; and the rear end of the beam and of the main frame are connected by a curved rod, which spans the intervening space and keeps the finger bar from sagging; and this, acting as a brace, is called a back beam.

Claim.—First, the metal draught frame A, with its left side nearly straight and its right side angling, and the whole otherwise constructed substantially as described, in combination with the wooden plank D, driver's seat F, and foot guard *e*, substantially as and for the purposes set forth.

Second, the arrangement consisting of the windlass H, draught chain I, and connexion J, or their equivalents, in combination with a draught frame and the main frame B, substantially in the manner described, so that the draught of the machine is always on the draught chain, whether the sill G is stationary or being raised or lowered.

Third, the eye bolts *q q*, eyes *o' o'*, and tongued and grooved plates *o* and *p*, for the purpose of forming a jointed connexion between the short sill G and finger bar K, substantially in the manner described.

Fourth, the combination with the elements named in the third claim of the slotted standard L, slotted timber or beam N *s*, and the bolts *w t*, substantially in the manner and for the purpose described.

Fifth, the metal back beam O, substantially in the form represented, applied to the top of the rear part of the main frame B B and to the top of the beam N, and standing diagonally over the platform or across the space occupied thereby, and by its arched and otherwise bent form being thrown high up above the same, substantially as and for the purposes set forth.

Sixth, the construction of the back beam in form substantially as represented, in combination with the diagonal arrangement thereof between the frame B and the beam N, and with the bolts *z z* and washer *y*, or the equivalent thereof, for the purpose of taking the sag out of the grain end of the finger bar, substantially in the manner described.

Seventh, the combination of the back beam O, constructed in form substantially as represented, and an adjustable platform U, substantially as described, for the purpose of affording a free discharge from the platform of the grain by means of a rake, although the platform may have been elevated at its rear end to a considerable height, as set forth.

Eighth, the combination of the back beam O, constructed substantially in form as represented, and the hinged or adjustable platform U and raker stand T, located at the inner corner of the platform, substantially as described and shown.

No. 37,392.—GEORGE ESTERLY, of White Water, Walworth county, Wis.—*Improvement in Header Attachments to Harvesting Machines*.—Patent dated January 13, 1863.—This improvement is intended to be attached to the harvester (patent No. 37,391) when it is desired to head the grain. Behind the finger bar is a spout or box, and in this is an endless apron, with slats which carry the heads to the side, where they are raised between aprons up an inclined way, which is supported by a brace from the main frame, and are discharged by a conductor in one row by means of the spout, which drags upon the stubble and lays it all one way for the reception of the heads. The spout which receives the heads from the cutter is hung by hinges to the finger beam, and at the back is suspended from the curved back beam which connects the rear part of the main frame with the rear part of the grain-gathering shoe, which projects into the standing grain.

Claim.—First, the header attachment for harvesters combining the several elements described herein and represented in the drawing, or the equivalent thereof, for use in connexion with the main frame Q, or its equivalent, of a reaper or mower, by being attached to the short sill of said frame, substantially as described.

Second, in a detached header organization, substantially as described, I claim the construction of the horizontal and inclined portions A A' of the spout in one piece, in combination with the supporting of the horizontal portion by hinges on the finger beam, and by chains or rods on a curved back beam, and with the supporting and adjusting of both portions together by means of an adjusting bracket of the main frame Q of a harvester, substantially as and for the purpose set forth.

Third, in connexion with an adjustable or hinged spout A A' of a detached header, the arrangement of the adjusting, supporting brace z, substantially as and for the purpose described.

Fourth, leaning the stubble of the field all one way for the deposit of the grain upon it by means of the hinged or swinging portion E, or its equivalent, of the conductor D, substantially as described.

Fifth, the combination of the back beam L, constructed substantially as described, with the sustaining rod or chain v, bracket y, support z, and grain side beam m, and with the main frame Q, spout A A', and conductor D D, substantially in the manner and for the purpose described.

Sixth, providing the main frame Q with the brackets y, support z, friction rollers 2 2, and the grooved eccentric P, to receive a header attachment, substantially as set forth.

Seventh, the combination of the independently adjustable finger beam H and divider l with an independently adjustable spout A A', aprons B B, and conductor D E, substantially as and for the purpose described.

No. 37,393.—NEWTON FOSTER, of Palmyra, N. Y.—*Improvement in Broadcast Seed and Manure Sowers*.—Patent dated January 13, 1863.—This improvement consists of a seed box or hopper with vertical sides and inclined bottom, at the lower angle of which are openings with a register plate. Pivoted to the bottom and attached at their upper ends to a reciprocating bar are a series of stirrers whose points project over the openings, and vibrating there prevent the clogging of the seed or pulverulent manure.

Claim.—The combination of the obliquely pivoted vibrating stirrers B and driving bar E, with the inclined seed box bottom c, angular slotted portion f, and regulating slides C D, all in the manner herein shown and described.

No. 37,394.—MINOR H. FOWLER, of New York, N. Y.—*Improvement in Lanterns for Burning Coal-oil*.—Patent dated January 13, 1863.—This improvement is intended to prevent the deflection of the flame caused by swinging the lantern, and consists in admitting the air by perforations in the flanged foot of the lantern and in the base of the lamp; and in making ledges or bearings on the lamp base, which, in connexion with the enveloping lantern foot and the inner projecting rim, at the foot of the cylinder, divide that space into chambers.

Claim.—First, the perforations b in the flange or base a of the part A of the lantern, when used in connexion with perforations h in the base e of the lamp E, or with other suitable air spaces in the bottom of the lantern and with or without the perforations d in the rim c, as and for the purpose herein set forth.

Second, constructing the base e of the lamp B with ledges or bearings f, substantially as shown and described, in connexion with the rim c, or other equivalent bearing attached to the part A, for the purpose of admitting air spaces g around the base e, as set forth.

Third, the combination of the perforations b in the flange or base a of the part A of the lantern; the perforations h in the base e of the lamp; the air spaces g found by the ledges or bearings f on the base e and the rim c, or its equivalent, all arranged as and for the purpose herein set forth.

No. 37,395.—HENRY GETTY, of Brooklyn, N. Y.—*Improvement in Pipe Tongs*.—Patent dated January 13, 1863.—A hooked jaw is pivoted to a lever whose cam-shaped head has a toothed surface; between the jaw and the cam the pipe is gripped, and according as the jaw is opened by pressure upon the thumb-piece it becomes adapted to receive a larger pipe.

Claim.—First, the hook-jaw constructed as shown in combination with a stationary serrated cam lever, for the purpose specified.

Second, in combination with the same, the finger rest D, for the purpose set forth.

No. 37,396.—R. D. GRANGER, of Albany, N. Y.—*Improvement in Cooking Stoves*.—Patent dated January 13, 1863. The invention consists in providing an air-chamber under the elevated oven, between it and the flue, and communicating by a pipe with the outside air so as to moderate the heat of that part of the oven; and further, in making connexion by apertures between the flue, air-chamber, and oven.

Claim.—First, in combination with the elevated oven, making the bottom of the oven double with an air space between the two, provided with a pipe *p*, or its equivalent, for the supply of cold air, substantially as described, whether such air space be made to communicate directly with the flue or with the oven as described, to insure the circulation of air through the said air-chamber, and thereby prevent the overheating of the bottom of the oven.

Second, in combination with the elevated oven and the air-chamber, at the bottom of the oven, substantially as described, connecting the said oven by apertures with the said air-chamber and the flue spaces, substantially as described, so as to cause a circulation of heated air through the oven, as described.

Third, in combination with the two compartments, one above the other and separated by a plate, the arrangement, substantially as described, of the apertures for the circulation of air through the said ovens, whether the air be admitted so as to circulate in the lower oven from the ends to the middle, and in the upper one from the middle toward the ends, or *vice versa*, as described.

No. 37,397.—ROBERT HITCHCOCK, of Watertown, New York.—*Improvement in Winding Clocks by Currents of Air*.—Patent dated January 13, 1863. This clock is intended to be driven by a spring, which is kept wound by a flutter-wheel of the "ventilator" pattern, set in a chimney or other position where a draught of air will rotate it; the vanes are hinged, and made self-opening and closing, and may be used in connexion with other vanes permanently attached to the shaft. The fourth claim describes an arrangement by which the obliquity of the vanes is regulated from the main-spring barrel so as to diminish the power of the flutter-wheel when the spring is nearly at its full tension.

Claim.—First, in combination with the shaft of a clock-operating spring, a flutter-wheel constructed as described, having its vanes so connected and hinged to radial spindles on said shaft as that the said vanes shall be allowed of being opened and closed and be made self-opening by their weight, essentially as shown and described.

Second, the combination for joint operation of fore-and-aft flutter-wheels, the one having movable or opening and closing vanes, and the other immovable ones, as described.

Third, controlling the opening and closing of the movable vanes of a flutter-wheel by the action of the main-spring of a clock, substantially as specified.

Fourth, the combination of devices consisting of the stop or stud on the main-spring barrel, the notched wheel gearing at intervals from the former and provided with an inclined plane, the sliding collar on the main-spring arbor and lever, hand and sliding collar operated thereby, or the equivalents of these devices, for the purpose herein described.

No. 37,398.—SETH HOKE, of Union City, Randolph county, Indiana.—*Improvement in Machines for Cutting Files*.—Patent dated January 13, 1863.—The file blank being secured on the bed, the cutter which is secured in a vertically vibrating frame pivoted to standards is exposed to the blows of a hammer which is also pivoted upon standards rising from the bed of the machine. The motion is given to the hammer by means of a wheel actuating a pendant rod from the end of the vibrating bar or hammer handle. Further, the shaft on which this wheel rotates has another wheel which actuates the cutter bar by the impingement of a cam-shaped projection on the pin of a vertically sliding bar attached to the cutter bar. The prolongation of the shaft forms a screw which moves the rest and feeds the file blank under the cutter.

Claim.—The hammer handle I, having the pendant bar K attached to it and provided with the ledge or shoulder M, in connexion with the frame Q, provided with the cutter R, and the bar U, provided with the projection *o*, the wheels E G, provided with the pins *a' h*, the bed B, and screw D, all arranged substantially as and for the purpose set forth.

Also, pivoting the cutter frame Q, in slides O O, for the purpose of regulating the height of said frame as described, but this only when the frame is used in connexion and arranged with the parts herein specified for the purpose set forth.

No. 37,399.—J. HOPE, of Castleton, Vt.—*Improvement in Camp Stoves*.—Patent dated January 13, 1863.—This stove consists of a box top of sheet metal provided with holes for the

chimney and for a kettle, and the whole having a wide flange or bottom plate intended to be set upon the ground, and span a trench cut in the ground which acts as a furnace; the stove being pinned to the ground through holes in its flanged base.

Claim.—The top or cover A, with its flange B, its aperture *d*, its holes and pins *c c c c*, its slide or door G, in combination, constructed substantially as herein described.

No. 37,400.—SOLOMON HUNT, of Danville, Hendricks county, Indiana.—*Improvement in Sheet Metal Cans.*—Patent dated January 13, 1863.—This appliance for the use of the tinner consists of an expansible block around which to form and fasten the joints of a can without seaming. The segmental blocks forming the shape are connected with spring levers, and these are hinged to a centre block so as to have a simultaneous action.

Claim.—The combination of the levers B, springs C D, bearing piece F, and segments A, with or without the slide G, arranged for joint operation as and for the purpose specified.

No. 37,401.—FREDERICK KETTLER, of Milwaukie, Wisconsin.—*Improved Mode of Raising Sunken Vessels.*—Patent dated January 13, 1863.—The apparatus consists of an auger to be screwed into the deck of a sunken vessel, to give a point of attachment for floats with which to buoy the vessel to the surface. The auger is rotated and screwed into the wooden deck by sinking rods shod with sharp points, to a point near the auger shaft, by which it may be rotated, and the screw at the foot caused to penetrate the deck. A roller is upon the auger-shaft and one upon the operating rod, and a rope being passed around them and carried to the surface is worked so as to rotate the auger and cause the thread to bury itself.

Claim.—First, the construction of the screw auger *a b*, as herein described.

Second, the screw auger, as combined with rods 11 and 12, plate 13, pulleys 14, ropes 16, teeth *c*, and balloons *d*, when arranged as herein specified, to form the instrument or machine C for raising sunken vessels.

No. 37,402.—GERVASE B. MANLEY, of Danville, Montour county, Penn.—*Improved Defensive Armor for Ships and other Batteries.*—Patent dated January 13, 1863.—The side of the vessel or battery is built up of plates which are dovetailed together by tongues passing longitudinally between the layers, and extending into each other, or a rib upon one fitting a corresponding recess in the other; bolts perpendicular to the plates pass through the whole series of dovetailed tongues and plates and fasten them together.

Claim.—The combination of the plates *a*, tongues *c* or *c'*, and bolts or rivets *b*, when the said plates are placed in planes perpendicular to the surface to be protected, the bolts or rivets passed directly through the tongues in the centre of the plates and perpendicularly to the latter, and all the parts constructed, arranged and secured, in the manner and for the purposes specified.

No. 37,403.—SYLVESTER MARSH, of Chicago, Ill.—*Improvement in Drying Grain, Malt, &c.*—Patent dated January 13, 1863.—The improvement consists in forcing a blast or current of fresh air over an open anthracite or coke fire, and into or through the mass of grain or other substance to be dried.

Claim.—The method of drying hops, broom corn, grain, and other like substances, by the employment, in combination with anthracite coal or coke as fuel, of any artificial current of air over the fire, substantially as herein shown and set forth.

No. 37,404.—THEOPHILUS MAYHEW, of Poughkeepsie, N. Y.—*Improvement in Feeders for Lamps.*—Patent dated January 13, 1863.—Attached to the lower part of the burner is a tube which fits telescopically into a tube which is fast to the collar on the lamp, so that the burner may be withdrawn without unscrewing.

Claim.—The screw thimble formed by the sockets *c* and *d*, applied between the burner and the collar on the lamp in the manner specified, whereby said burner and lamp are connected, but the lamp burner can be raised for filling the reservoir without unscrewing the burner, as specified.

No. 34,405.—ELIHU C. and JOHN W. NEWLAND, of Bedford, Lawrence county, Ind.—*Improvement in Hoes.*—Patent dated January 13, 1863.—Attached to a handle is a metallic socket having a projecting flange to fit a corresponding depression in the blade of the hoe and a central orifice for the insertion of a headed screw, which passes through the blade and into the handle to secure them together.

Claim.—The arrangement of the socket A provided with the projections P P', and the plate H, having corresponding notches and attached to the socket by means of the screw S, all constructed and operating as and for the purpose described.

No. 37,406.—JOHN OLIPHANT, of Uniontown, Fayette county, Penn.—*Improvement in Safety Nipple-guard for Fire-arms.*—Patent dated January 13, 1863.—This improvement consists of a slotted bar which is adapted to slide back, embracing the nipple between flanges, so as to receive the blow of the hammer and prevent the latter from coming in contact with the cap on the nipple, so long as the slide is in that position.

Claim.—The gun nipple-guard J provided with the inclined planes *g g*, and slit *n*, the slot *m*, screw *k*, and spring *o*, arranged and constructed as shown and described for the purpose set forth.

No. 37,407.—JOHN OLIPHANT, of Uniontown, Penn.—*Improvement in Breech-loading Fire-arms*.—Patent dated January 13, 1863.—Within a yoke at the rear of the barrel are a vibrating charge-chamber and breech-block. These both vibrate vertically on horizontal pins which pass through the sides of the yoke; the breech-block being raised, the charge-chamber is retracted to the rear so as to bring its forward end clear of the barrel; it is then raised to a convenient position for loading, the pin on which it is vibrated being provided with a nipple. The hammer strikes from the side of the gun, and the flange on the end admits of the withdrawal of the nipple which is attached to the reciprocating charge-chamber without raising the hammer. A sliding pin in the trigger is made to impinge against a projection on the tumbler and raise the hammer and disengage it without previous cocking when so desired. When cocked, the tumbler is released and the hammer sprung by the impingement of an inclined face on the side of the rear part of the trigger upon an inclination on the cam attached to the sere which withdraws the pawl from the notch.

Claim.—First, the steel pin *r* provided with the nipple *s*, in combination with a vibrating reciprocating charge-chamber, as described, &c.

Second, the hammer *F* constructed with the flange *m'*, arranged as described, working on the side of the gun, in combination with a reciprocating nipple, substantially as described and for the purposes set forth.

Third, the cam *f''* attached to the tumbler of a gun lock, in combination with the sliding steel pin *G''*, constructed and operating substantially as described.

Fourth, the cam *g'* attached to the sere of a gun lock in combination with the trigger *G'*, the steel sliding pin *G''*, and the cam-shaped projection *f''*, substantially and for the purposes described.

No. 37,408.—THEODORE PALMER, of Catskill, Green county, N. Y.—*Improvement in Raking and Binding attachment to Harvesters*.—Patent dated January 13, 1863.—In this machine the grain is gathered from the platform and bound with cord, which is tied into a knot by power derived from the driving wheels. The grain is drawn from the slatted platform by a reciprocating rake, when it is caught up by cradle hooks, clamped and bound by a series of operations which involve details that cannot be condensed within the limits of this abstract.

Claim.—First, the combination of the rake *B*, endless chain *D*, guide *e'*, ledges *k'' k'''*, and bevelled bar *l*, all arranged as shown to admit of the rake *B*, operating as and for the purpose herein set forth.

Second, the manner as shown of operating the hooks *t t*, or turning the shaft *J*, thereof, to wit, by means of the wheel *M*, provided with a smooth and toothed periphery, the plate *d'*, connected with the India-rubber *g'*, the bar *j'*, provided with the pawl *m'*, and the cam projections *v v' v''* on wheel *I*, all arranged as and for the purpose herein set forth.

Third, the combination and arrangement of the lever *R*, arm *T*, hook *s'*, cutter *Y*, arm *Z*, with the projection or knob *i** at its end, arm *w'*, and the slide *A'* on the central tooth *p* of the shaft *G*, all arranged to operate as and for the purpose specified.

No. 37,409.—DAVID C. PERRIN, of Roxbury, Mass.—*Improved Manufacture of Palm-leaf Hats and Bonnets*.—Patent dated January 13, 1863.—The fabric from which these garments are made consists of a thread warp, with a filling of palm-leaf strips, strengthened by a backing of cotton cloth, and is intended as a substitute for straw braid. The warp threads are arranged to bind the strands of palm leaf between them, and spaces are left in the rows of warp threads, forming them into clusters of the desired width, so as to allow the fabric after the backing has been applied to be cut into strips through the filling and in an interval between the warp threads. The ribbon or strip thus obtained is sized and pressed to be afterwards worked as straw braid.

Claim.—The palm-leaf strip made in the manner substantially as above described for the purpose specified.

No. 37,410.—JOHN SIDDONS, of Rochester, N. Y.—*Improvement in Machines for Seaming Metallic Roofing*.—Patent dated January 13, 1863.—This consists of a travelling seamer running upon rollers and spanning the upturned edges of the plates to be seamed. A pair of horizontally rotating rollers clamp the upturned edges closely; a closing roller with a deep groove follows and turns the more elevated edge over the other, and other succeeding rollers compress the down turned edge firmly. Appliances are provided to allow of the yielding of the closing roller to inequalities in the seam, and to prevent tilting of the machine, which is driven by a hand crank by a rider.

Claim.—First, inclining the axes of the folding rollers *C* and *E*, as described, so that their rotation by means of the friction between them and the sides of the seam shall cause them to hug the roof effectually.

Second, the employment of the closing roller *D*, constructed and arranged in the manner specified, in combination with the folding rollers *C* and *E*, and the compressing roller *C'*.

Third, the combination of the spring *g*, and set screw *h*, with the adjustable box *B''*, whereby the roller *E* is allowed to yield and adapt itself to any inequalities of thickness in the seam, such as cross seams, and the different thickness of metals used.

Fourth, preventing the rear end of the machine from rising from the roof while in operation, by means of the shoulder of the gain *p*, in the right-hand compressing roller *C'*, of the rear set, catching under the fold of the seam, as specified.

Fifth, the self-adjusting seat *S*, constructed and arranged substantially as described, in combination with the other parts of the machine.

No. 37,411.—EDWIN A. STEVENS, of Hoboken, N. J.—*Improved Construction and Defence of War Vessels*.—Patent dated January 13, 1863.—This improvement consists in making vessels with double sides, the intervening space being divided into compartments. Further, in making the deck double, with the space between the said decks divided off, so that the vital parts of the vessel (the room necessary for engine and appurtenances, and the crew, with accommodations for them, and for working the deck gun which is operated from below) may be protected from projectiles by a casing of water, the deck being submerged below the water-line, and flotation insured in case of accident to the bulwarks by buoyant indestructible structures on deck. Elastic chambers or bags of air are submerged in the protecting water space, so as to give elasticity by contraction on the concussion of the projectiles.

Claim.—First, lowering a war vessel in the water so that a water-protected deck shall be lower than the surface of the water outside, substantially in the manner and for the purpose described.

Second, the buoyant structure, substantially as described, applied to a partially or wholly submerged war vessel to impart stability and buoyancy thereto.

Third, the buoyant structure referred to in the foregoing claim, in combination with a protected deck situated or placed below the water-line of a war vessel, substantially as described.

Fourth, an air vessel constructed in any suitable manner and combined with any of the water compartments or vessels specified, substantially as and for the objects described.

No. 37,412.—WILLIAM GEORGE VALLENTIN, of Oxford street, London, England.—*Improvement in Coking Coal and Generating Gases*.—Patent dated January 13, 1863.—Patented in England February 13, 1862.—In this improvement the coal is exposed in a heated close chamber of a high, long, and narrow shape, with a funnel-shaped feed opening and a movable bottom for the discharge of coke. The chambers are heated by the burning of the gas evolved in the coking process, the gas being introduced around the chambers in numerous flues, together with the requisite amount of atmospheric air.

Claim.—Coking coal in close chambers or retorts heated externally by the combustion of gases generated from similar previous coking operations and applied in the manner herein set forth.

Also, the use of the vertical close chambers or retorts *a*, in combination with the external flues or heating channels supplied with combustible gases and air from the burners *f*.

Also, the use and application of the combination of parts whether for coking coal or generating combustible gases for heating and lighting purposes.

No. 37,413.—THOMAS C. WALES, of Dorchester, Mass.—*Improved Water-proof Shoes*.—Patent dated January 13, 1863.—This improvement in the mode of finishing the edges of the "upper" in shoes, consists in lapping a band around a binding cord, the said band being embraced between the two folds of the upper.

Claim.—The improved cemented or water-proof shoe or combination of a binding cord *e* and a lapping band or cover *d* together, and with the two folds or layers *e f*, of the upper, substantially as hereinbefore specified.

No. 37,414.—THEODORE W. MAYHEW, of Nettle Lake, Williams county, Ohio.—*Improvement in Beehives*.—Patent dated January 13, 1863.—At the front and sides of the hive and near the floor are openings covered with wire gauze, and at the upper part of the hive, projecting from under the eaves, are spouts or passage ways with openings in their roof and floors guarded with wire gauze.

Claim.—The arrangement of the gauze openings *E F* and the passage ways *M N* with the gauze openings *m n*, in combination with the hive, substantially as set forth.

No. 37,415.—WILLIAM CANTER, of New York, N. Y., assignor to SAMUEL BERNSTEIN, of the same place.—*Improvement in Machinery for Manufacturing Chenille*.—Patent dated January 13, 1863.—This invention consists of appliances by which the twist is given to the chenille at the proper point, but not allowed to run back to the point where the plush is cut; a method of guiding and feeding, and a device for taking up the slack of the wire, which becomes stretched in the process. These are accomplished by running the cord which draws the chenille over a roller and through a hollow revolving head, which gives it the required twist, a pair of rollers, over which it has previously passed, preventing the twist from running back; being fed and guided in the place where the chenille is wrapped by a continuous wire, the slack of which is taken up and due tension preserved by an adjustable pulley and sheaves.

Claim.—First, the employment in the chenille machines of the revolving sheave or wheel *N* operating in combination with the cords *M* and *Q* and swivel *P*, substantially as herein set forth.

Second, the employment in chenille machines of the surface G or H, or both, to restrain the twist of the goods, substantially as herein set forth.

Third, the use in chenille machines of the continuous wire W, or its equivalent, arranged to operate substantially in the manner and with the advantage herein set forth.

Fourth, the employment in machines for making chenille of the sheave 3, or its equivalent, arranged to operate in combination with the continuous wire or cord W, substantially as and for the purpose herein set forth.

No. 37,416.—WILLIAM WHEELER, of Poultney, Rutland county, Vt., assignor to Himself and JOSHUA POOR, of the same place.—*Improvement in Stoves*.—Patent dated January 13, 1863.—This stove is constructed with an interior heating furnace and an exterior air-chamber surrounded by a soapstone casing, which is held at certain points by flanges projecting outwardly from the iron furnace contained in it. A slide below the furnace has an aperture for the purpose of moderating the draught. Upon a tilting grate is a perforated arch to introduce air to the centre of the fire and assist in breaking the crust. Above the fire is a feeding cylinder occupying the central portion of the upper part of the body of the stove, which is closed by a cover except when introducing fuel, and is surrounded by an annular flue space.

Claim.—The soapstone or other equivalent slowly-conducting radiating case, combined with an interior furnace and a close air space S, which is next to and immediately surrounds the furnace and its flue, substantially as and for the purpose herein specified.

Also, the slide U with the draught aperture *u* between the grate and ash-pan, substantially as and for the purpose set forth.

Also, the perforated chamber W when attached to and used in combination with a tilting grate N, so as to receive lateral vibratory motion therefrom, and thereby serve the additional purpose of breaking the coal crust at the top, substantially as specified.

Also, the double-flanged flange-plates F G H I K L, constructed and arranged substantially as described, in combination with the soapstone staves, for the purpose specified.

Also, the combination of the annular flue Q with the annular door air-space S, and slowly-conducting radiating case, substantially as herein set forth.

No. 37,417.—LINSON DE FOREST, of Birmingham, Conn., assignor to Himself and THOS. B. DE FOREST, of the same place.—*Improvement in Eyeletting Machines*.—Patent dated January 13, 1863.—The work is laid upon a table and passed over the point where the upper and lower dies operate. Here a conduit in the table connects with a supply of eyelets from a hopper, by which they are fed to the machine. A feed-bar carries one to its place on the lower die, when the perforating punch descending pierces the work and enters the eyelet. The lower die now ascending opens the jaws and the square faces of the dies bring the eyelet to its bearings in a double-circular flange upon the work.

Claim.—The employment of a table or supporting surface to sustain the work or material being eyeleted, substantially as hereinbefore set forth.

Also, the employment, in combination with the work-supporting table, of two sets of dies *d* and *d'*, the lower one receiving and carrying up the eyelet through the work-table, and the two operating together to clinch the eyelet, substantially as hereinbefore described.

Also, the combination of the two dies *d* and *d'* with a perforating punch *c* and work-supporting table or surface, the whole operating substantially as described for the purpose set forth.

Also, forming a conduit or passage in the table H, in combination with a feeder I, or its equivalent, whereby an eyelet deposited in the said conduit is led into the die *d*, substantially as described.

Also, the employment of a chute I, constructed substantially as described, in combination with a hopper J, whereby the eyelets thrown promiscuously in the said hopper are fed or conducted in a given position to the mechanism for presenting them to and securing them in the work, substantially as hereinbefore described.

No. 37,418.—THOMAS DE FOREST, of Birmingham, Conn., assignor to Himself and LINSON DE FOREST, of the same place.—*Improvement in Eyeletting Machines*.—Patent dated January 13, 1863.—This improvement consists in the arrangements for feeding the eyelets to the machine, by which, when they are thrown promiscuously in a hopper they are fed into line, turned into the proper position, or if they prove intractable, discharged from the machine. This is done by placing them in an inclined chute with divisions, &c., which arrest the salient points of the cap until it assumes that position in which it fits the shape of the conveyor, and is carried to the feeding bar which waits upon the dies.

Claim.—The employment, in combination with a hopper and shaking table, substantially as described, of a mechanism for turning those eyelets which start in a wrong position over into the proper position, substantially as set forth.

Also, in combination with a conductor J, or its equivalent, a device for discharging from it all eyelets which may have entered it in a wrong position, substantially as hereinbefore described.

Also, forming a lip 19, or its equivalent, on the forward end of the feeder to prevent the displacement of the eyelets, substantially as hereinbefore set forth.

No. 37,419.—MAJOR H. FISHER, of Bridgeport, Conn., assignor to THE FRANKLIN FILE COMPANY, of the same place.—*Improvement in Machines for Cutting Files.*—Patent dated January 13, 1863. The improvement consists in the method of attachment of the chisel within the oblique slot of the chisel-arm, by attaching a steel point to the under side of the chisel-arm which projects into an inclined notch in the chisel; a circular spring in front of the chisel presses against it, and holds it to a proper angle, being adjusted by a set-screw.

Claim.—First, the inclined notch *i* in the chisel.

Second, the adjustable spring *c* in combination with the notch *i*, substantially as and for the purposes described.

No. 37,420.—BENJAMIN A. JOHNSON, of North Auburn, Androscoggin county, Me., assignor to Himself and EARL BLOSSOM, of the same place.—*Improvement in Railroad Snow Ploughs.*—Patent dated January 13, 1863.—This snow plough consists of a wheeled truck to precede the locomotive, on which is an inclined plane to enter below the snow and lift it between walls or siding, to be discharged upon the snow bank at each side by mould boards. A prow cleaves the upper layers of snow when it is deep, and a swinging centre board divides it so as to pass up the inclined plane to be discharged at each side. The machine is guided by a wheel, chain, and pulleys, so as to preserve the centre of the track in curves.

Claim.—The side walls *c*, side slides *S*, swing bar *B B*, grooves *P P*, top covering *t*, and the opening or space through which the snow passes, combined and operating in connexion with the wheels *W*, draw bar *D*, frame-work *A A*, pulleys *x*, chain *L*, rope *R*, spring *S S*, break or upright shaft *O*, mould boards *M* and *i*, inclined plane *P*, and swing centre board *A*, substantially as set forth, and for the purpose specified.

No. 37,421.—HENRY RANDALL, of San Francisco, Cal., assignor to Himself and J. P. BALDWIN, of New York, N. Y.—*Improved Construction and Location of Paddle Wheels.*—Patent dated January 13, 1863.—Four wheels are used, each pair driven by independent engines, the after pair being larger than, and located in the comparatively still water abaft the forward pair.

The object being to secure safety by the distribution of the weight of the engines and boilers, and by the diminution of the chances of the machinery being disabled, as well as to facilitate her passage through the water.

Claim.—Not the use of four wheels to a steamer, but their peculiar location in combination with the ship, the engines, and with each other, namely:

The application of four wheels, (two pairs,) when each pair is disconnected from the other, driven by independent engines, and the after pair is so much larger than the forward pair as to take up the slip of the latter when making the same number of revolutions, substantially as described; said after pair, moreover, being located at such distance from the other pair as to be in the water made comparatively smooth by the latter; and finally, so located in regard to the hull of the ship, and their buckets so arranged as to throw the water well inward under the run of the vessel and relieve her from the dead or partially towing-water, substantially as described; the whole being for the objects and reasons explained.

No. 37,422.—FRANKLIN SMITH, of Dorchester, Mass., assignor to Himself and GEORGE W. SMITH, of the same place; SYLVANUS A. DENIO, CHARLES ROBERTS, and ANNIE SMITH, of Boston, Mass.; and JOSEPH LOVETT, of Somerville, Mass.—*Tool for Inserting Putty beneath Vault Glasses.*—Patent dated January 13, 1863.—This tool consists of a cylinder filled with putty, having a piston operated by a screw and a nozzle with an annular orifice, which is pushed up the opening into which the glass is to be inserted; a portion of the putty being expressed and left upon the ledge for the glass to rest upon.

Claim.—The within-described tool, constructed and operating substantially as set forth, for the purpose specified.

No. 37,423.—BARNEY H. MONKE, of Cincinnati, Ohio, assignor to CHAMBERLAIN & Co., of the same place.—*Improvement in Teakettles.*—Patent dated January 13, 1863.—The improvement consists in the method of attaching the lid to the kettle. A projection is cast upon the kettle having a conical neck and an enlarged head; over this by means of a slot the lid is passed, and the two retained in position by the bail or handle.

Claim.—The pot or kettle *A*, having the described chamfer-headed and conical-necked ear *D* and correspondingly perforated lid *B*, the whole being secured by the insertion of the bail, in the manner set forth.

No. 37,424.—A. MYERS, of Springfield, Ohio.—*Improved Sorghum Wine.*—Patent issued January 13, 1863.—Antedated July 13, 1862.—The wine is made by the evaporation of the juice to a density of from 15° to 25° Baume, and then removing to a cellar for fermentation; care being taken to use no neutralizing material in the boiling process.

Claim.—First, sorghum wine, prepared substantially as described.

Second, the process of fermentation, substantially as described.

No. 37,425.—RICHARD C. ROBBINS, of Jersey City, N. J.—*Improvement in Gas Pipe Joints.*—Patent dated January 13, 1863.—Around the interior of the socket, into which the

next section of the pipe is to be inserted, is an annular recess, which is cast full of lead, leaving the lead projecting as a circular flange. The next pipe has a slightly conical end, and is forced in by a yoke and screws, so as to jam firmly against the lead and make a tight joint.

Claim.—The method of forming the packing by means of casting lead or other suitable material in a circular groove in the mouth of the socket of the pipe, and into which the tapering end of the succeeding pipe is intended to be forced in the manner and for the purpose substantially as set forth.

No. 37,426.—ALEXANDER SCHULTZ, of Mulhouse, Lyons, France.—*Improved Mordant for Fixing Aniline Colors.*—Patent dated January 13, 1863.—This mordant is intended as a substitute for albumen, gluten, tannin, &c., used to fix aniline colors, and arsenite of soda for fixing coloring matters extracted from coal oil, and in the preparation of lakes derived from that source.

Claim.—The preparation and use of the mordant hereinbefore described for fixing aniline or other coloring matter extracted from coal tar upon fibrous or textile material, the said mordant consisting essentially in the combination in various proportions of acetate of alumina with arsenite of soda, and whether used separately from but in connexion with or as a mixture with the said coloring matter or otherwise, substantially as herein set forth.

No. 37,427.—RICHARD N. ALLEN, of Cleveland, Ohio.—*Improved Oil Barrel.*—Patent dated January 20, 1863.—The inventor makes a cylinder of metal, the heads or disks of which are inserted by making their diameter larger than that of the cylinder, then turning the edges at right angles until the lips thus formed fit exactly in the cylinder to which they are riveted or otherwise fastened. Around this cylinder are placed wooden staves fastened in the usual manner. The bunghole consists of a metal ring, screwed into the head, and provided with a cap. Through the bung runs an air-vent pipe turning at right angles and running parallel with and near the head of the barrel to near its side, allowing the air to enter when emptying, or to escape when filling the cask.

Claim.—The herein-described oil barrel or cask in which the parts are constructed, combined, and arranged in the manner and for the purpose set forth, the same being a new article of manufacture.

No. 37,428.—G. W. ANSLEY, of Cleveland, Cuyahoga county, Ohio.—*Improvement in Skates.*—Patent dated January 20, 1863.—The invention consist in making a spring skate which shall be adjustable to the weight of the wearer as well as possessing perfect elasticity.

Claim.—The arrangement of the spring C, stem E, pivoted or jointed to the runner, adjustable plate H, and socket D, substantially as and for the purpose set forth.

No. 37,429.—DANIEL ARMEL, of Somerset, Somerset county, Pa.—*Improvement in Hay Rakes.*—Patent dated January 20, 1863.—The object of this invention is to provide modes of placing the rake under the control of the driver. This is effected by two foot levers on a roller on the foot board of the driver, one of which trips the rake and discharges the hay, and the other restores it to its working position.

Claim.—The combination of the tread-lever C with the platform A, seat *b*, and arms *f f'*, substantially as and for the purpose described.

No. 37,430.—J. BERGSTRESSER, of Berrysburg, Dauphin county, Pa.—*Improvement in Grain Scouring Machines.*—Patent dated January 20, 1863.—This improvement consists of a cylindrical chamber with openings or slits in the periphery, within which a vertical shaft revolves, having upon it a continuous spiral flange with projections on the upper side.

Claim.—The shape and construction of the spiral scourer B, with its projections J, for scouring grain, substantially as described.

No. 37,431.—CHARLES K. BROWN, of Troy, N. Y.—*Improvement in Paper Shirt Collars.*—Patent dated January 20, 1863.—The invention consists in strengthening the parts exposed to the most strain in putting on, or in use, by the addition of a piece of muslin around the button holes of the collar.

Claim.—A paper shirt collar having the parts at or around the button holes *d* therein made thicker and stronger than the main portion thereof, by means of a piece or pieces *c* of thin muslin or other suitable strengthening material pasted or otherwise cemented in or to the layer or united layers of paper constituting the main portion or body of the collar, substantially as here described.

No. 37,432.—JAMES A. CAMPBELL, Buffalo, N. Y.—*Improvement in Machine for Printing Addresses on Newspapers, &c.*—Patent dated January 20, 1863.—This machine is constructed to be used in connexion with a common chase, over which it is supported by end pieces and automatically advanced after each depression of the platen; resting upon ways, which span the chase, is a traversing bed piece with an upright, affording a pivoted attachment for a lever, which alternately depresses and elevates a platen on the guide rod. The

upward motion of the lever by means of the toggle, actuates the wheel, which, mashing into a rack, advances the platen to deliver another impression on an advanced point.

Claim.—First, the combination of the levers E K, bar L, wheels I J, sleeve *n*, rack M, sills H, and a sliding bed-piece B, whereby the machine is automatically advanced after each depression of the platen by devices independent of the chase.

Second, the combination with an addressing machine, substantially such as described, of the sills or ways A A and cross-pieces *a a*, adapting the machine to fit over a common chase placed upon a common table, and to be moved in a right line from end to end or from side to side of the said chase.

No. 37,433.—CHARLES W. COE, of Carmina, Shiawassee county, Michigan.—*Improvement in Drilling and Screw-cutting Machine.*—Patent dated January 20, 1863.—The machine consists of an upright drill stock, which rotates in bearings under the impulse of a bevel wheel gearing into a pinion, which is fastened to the drill stock by a pin which allows the stock to slip through vertically. The bevel wheel is driven by a hand crank, and has a pinion shaft and fly-wheel to secure steadiness of motion. A screw, working in a nut in the upper bearing and attached to the upper end of the drill stock by a swivel joint, projects the tool and a ratchet and a pawl; the latter actuated by a cam on the face of the bevel wheel is the automatic feed for the drill stock. Jaws with lugs fitting into holes in the bench form adjustable clamps for holding the plate, &c., to be operated upon.

Claim.—The combination of the gearing D E H with the screw K, ratchet M, adjustable pawl N, shaft I, cam Q, and the moving or rising and falling jaws S S', all arranged for joint operation as and for the purpose herein set forth.

No. 37,434.—FRANKLIN K. COSGROVE and RUDOLPH WESTERMAN, of Fort Wayne, Allen county, Indiana.—*Improvement in Fences.*—Patent dated January 20, 1863.—The fence is made in ordinary lengths of, say, five board sections, and braces are placed on each side, which by their bill-shaped ends hook over the third board, and are keyed down on to it by wedges *f e* under the next higher board. The feet of the braces are secured by stakes driven into the ground.

Claim.—The arrangement of the bill-shaped ends *c* of the braces B, in combination with chamfered edges of the mortises *d* in the battens *b b'*, and with gibs *e*, keys *f*, and anchor stakes *g*, all constructed and applied in the manner and for the purpose herein shown and described.

No. 37,435.—LYMAN DERBY, of New York, N. Y.—*Improvement in Screw Nuts.*—Patent dated January 20, 1863.—The invention consists in making the nut in two parts transversely of the axis, and forming semicircular inclined planes on their matching faces of a pitch greater than the thread of the bolt, so that after screwing them up together to the shoulder the outer one may be unscrewed a little to cause the inclined surfaces to climb one on the other and make a jamb nut of it to hold both in position.

Claim.—The construction of a screw nut, substantially as hereinbefore described, and operating in the manner and for the purposes set forth.

No. 37,436.—H. W. DOPP, of Buffalo, N. Y.—*Improvement in Apparatus for Burning Coal Oil for Heating Purposes.*—Patent dated January 20, 1863.—The burner is first brought to a proper heat by an alcohol lamp, and then a stream of coal oil being turned on it is burnt beneath a distributing plate, which in turn communicates its heat to the tubes in which the oil is passing, to generate the gas for continued ignition.

Claim.—The distributing plate A, with solid centre *a* and generator B, or their equivalent, so arranged that the vapor shall escape from one or more small orifices into the unconfined atmosphere, and be arrested by means of the solid part of the plate A, or its equivalent, for the purpose of causing its combustion after it is thus arrested, sufficient heat being obtained thereby to keep up continuous vaporization, substantially as described.

Also, the combination of the crank pin and the cam groove to obtain an up-and-down motion of the graduating valve C, substantially as and for the purpose herein described.

No. 37,437.—J. B. EDGELL, E. A. ALEXANDER, and H. C. KELLOG, of Quasqueton, Buchanan county, Iowa.—*Improvement in Churns.*—Patent dated January 20, 1863.—The churn is set upon a bench or a frame, and the dasher is suspended from the top of a vertical shaft which passes up through a tube which is fast to the bottom and occupies the central portion of the churn.

Claim.—First, suspending the dasher F from the top end of a vertical shaft C, substantially in the manner and for the purpose herein shown and described.

Second, the arrangement of the central tube *b* fastened to the bottom of the tub A in combination with the vertical shaft C, constructed and operating as and for the purpose herein specified.

No. 37,438.—PETER E. FALCON, Cohasset, Norfolk county, Mass.—*Improved mode of Raising Sunken Vessels.*—Patent dated January 20, 1863.—The invention consists in attach-

ing to, or placing in a sunken vessel a number of casks, bunghole down, and then by means of an air pump and pipe introducing air into the casks so as to cause the vessel to ascend by their comparative levity.

Claim.—Improved process of raising sunken vessels by means of casks or contrivances of like character, the same consisting in arranging the said casks filled with water, on or within a vessel, and with their bungholes downward, as set forth, introducing an air conduit into the bungholes of the casks successively, and forcing air through such pipe and into each cask, and expelling the water of such cask out of the bunghole, and with respect to the said air pipe, substantially as specified.

No. 37,439.—THOMAS FARNSWORTH, of Cleveland, Ohio.—*Improved Combined Washing, Wringing, and Mangling Machine.*—Patent dated January 20, 1863.—The invention consists of a series of appliances. The clothes are beaten between a vibrating gate, the slats of whose lower part correspond with the intervals between cleats on the sides of the box; they are then run between rollers rotating in standards, being driven by a hand crank wheel and pinion. The clothes are fed to the rollers by an endless apron, and after wringing fall upon a shelf table.

Claim.—The sections A B, the beater, Fig. 5, the rollers J K, wheel M, and pinion N, in combination with the table S and endless apron T, when all these parts are arranged and operated as and for the purpose specified.

No. 37,440.—JOHN FAULKNER, of Dansville, Livingston county, N. Y.—*Improvement in Grain Separators.*—Patent dated January 20, 1863.—The invention consists in making a sieve of sheet metal with long square-sided apertures through it; it is further defined to consist in making them parallel with the course of the grain over them and transverse to the motion of the shaking shoe.

Claim.—First, a sheet-metal sieve A, with apertures *a*, arranged in the manner and for the purpose described.

Second, a sheet-metal sieve with apertures *a* in line with the flow of the grain over it, and at right angles to the movement of the shoe D of the fanning mill, in the manner and for the purpose described.

No. 37,441.—F. H. FURNISS and F. R. MYERS, of Cleveland, Ohio.—*Improvement in Railroad Baggage Checks.*—Patent dated January 20, 1863.—On this baggage check the necessary numbers, one for each station, are stamped and have a corresponding slot. The strap is fastened to the end, and is brought through the plate in the slot opposite to that figure which answers to the station for which the checked baggage is designed.

Claim.—Placing the number or names of stations on baggage checks, in consecutive order, with intermediate or corresponding openings or slots for the insertion of the strap, as and for the purpose specified.

No. 37,442.—BENJAMIN GARVEY, of New York, N. Y.—*Improvement in Lamps.*—Patent dated January 20, 1863.—The wick tube is made of porcelain, or other material that does not readily conduct heat, so as to confine the heat to the point of combustion and prevent the conduction of heat to the reservoir. These tubes may imitate candles of wax or paraffine; and the wick is made with an incombustible surface and an absorbent core, such as a roll of cotton in wire gauze.

Claim.—Incombustible wicks for lamps, formed of the materials and in the manner substantially as described in the accompanying specification.

Also, the application to lamps of tubes of glass, glazed pottery, or other such material, which is a bad conductor of heat, and is at the same time impervious to the fuel, for the purpose of protecting the wick from the cooling effects of external air, and of confining the heat of the flame, as far as possible, to the wick, in the manner set forth substantially in the accompanying specification.

Also, wick tubes of any suitable material in imitation of candles or tapers of wax, spermaceti, paraffine, &c., in the manner described in the accompanying specification.

No. 37,443.—VALENTINE HAEFFNER, of Dobbs Ferry, Westchester county, N. Y.—*Improved Beer-Cooler.*—Patent dated January 20, 1863.—This invention consists in a series of metallic troughs of semicircular section, placed at a certain distance apart for the circulation of air between them, and connected at the ends with similar transverse troughs; the said troughs being traversed through their whole extent by cold-water pipes.

Claim.—The arrangement of the air spaces *a* between the troughs A, when the latter are used in combination with cold-water pipes C, substantially in the manner and for the purpose herein shown and described.

No. 37,444.—PETER HAMMOND, of Castleton, Richmond county, N. Y.—*Improvement in Surface Condensers.*—Patent dated January 20, 1863.—The steam in this surface condenser is compelled to pass in a wavy track between walls of corrugated sheet-iron, which are sharpened on their edges, and strips driven on so as to make a tight joint the length of the plate; the steam then enters a segmental chamber and is returned between another pair of corrugated plates, and so on as may be necessary.

Claim.—Combining the plates A A, or their equivalents, which constitute the cooling surfaces of the condenser or cooler by means of strips C C applied and clamped in their places, substantially as herein set forth.

No. 37,445.—WILLIAM CLEVELAND HICKS, of New York, N. Y.—*Improvement in Drop Presses.*—Patent dated January 20, 1863.—The hammer being raised by the winding drum, touches the rod connected with the unshipping clutch and causes the weight to descend; it is so proportioned that as soon as the hammer commences to fall, the clutch on the winding shaft is thrown in gear and begins to tighten the lifting strap as the blow is struck, so that on the recoil of the hammer it is retained and not allowed to make a second uncertain blow.

Claim.—The method of unwinding the hammer belt immediately upon its reaching the requisite elevation by the employment, in combination with the ordinary winding drum, shipping clutch and appurtenances, of auxiliary friction rolls or drums, the whole being arranged to operate substantially in the manner and for the purposes set forth.

Also, preventing the hammer from rebounding by the means and in the manner hereinbefore described, or in any other manner substantially the same.

No. 37,446.—LIVERAS HULL, of Charlestown, Mass.—*Improved Machine for Cutting Caoutchouc, &c., into Strips and Threads.*—Patent dated January 20, 1863.—The caoutchouc is stretched upon a drum or cylinder so as to be rotated against the edge of a revolving circular cutter, which is mounted upon a traversing slide rest, having a motion to and from the cylinder to bring it into action or remove it and determine the depth of the cut, and a feed motion parallel to the axis of the cylinder so as to cut the whole covering of the cylinder into a continuous strip.

Claim.—My improved caoutchouc-cutting machine, having its several parts constructed and arranged in manner and so as to operate substantially as described, such machine not only having a single drum or cylinder to support, and a revolving knife to cut a sheet of caoutchouc, as explained, but having machinery for traversing the rotary knife with reference to the drum, and also having machinery for moving such knife toward and away from the drum, as specified.

No. 37,447.—BENJAMIN IRVING, of New York, N. Y.—*Improvement in Skates.*—Patent dated January 20, 1863.—The foot being placed upon the skate and the adjustable clamps brought up to it so as to fit the various parts they are intended to engage, the heel-piece or clamp is violently retracted forward by the movement of the toggles on the side of the skate so as to bring the boot firmly against all the bearings with which it is in connexion.

Claim.—First, actuating the clamp *k i*, by means of the system of levers *m n*, thereby engaging it and the adjustable clamp *d e* to the boot or shoe, when the whole are combined, arranged and operated substantially as described.

Second, the combination of the especially-adjustable heel clamp *k i* with the toggle levers, when arranged and operated substantially as described.

Third, the combination of the toe, side and heel clamps, when adjustable severally and in relation to each other, substantially as described.

No. 37,448.—JOEL C. JACKSON, of Rochester, N. Y.—*Improvement in Bumpers and Draw-head Springs for Railroad Cars.*—Patent dated January 20, 1863.—Attached to the bumper is a draw-bar with a disk flange working in a spring box. The disk on the draw-bar occupies the centre of the cylindrical box, and the space at both ends is filled with elastic material so as to resist pressure in either direction.

Claim.—The draw-bar *c*, and disk *e*, in combination with the springs *f* and *g*, and draw-box *b*, for the purposes and as specified.

No. 37,449.—ADOLPH LANGE, of Glashütte, near Dresden, Saxony.—*Improvement in Watch Cases.*—Patent dated January 20, 1863.—The bezel holding the glass is usually attached to the case outside of the movement, but in this improvement the bezel for the glass is placed directly upon the movement itself.

Claim.—Attaching the bezel for the glass in a hunting-case watch directly to the movement, in the manner and for the purpose substantially as set forth herein.

No. 37,450.—VALENTINE LASSERRE, of Paris, France.—*Improvement in Roofs.*—Patent dated January 20, 1863.—The object is to make a tightly-fitting joint at the point where the screw or bolt passes through the metallic roofing plate to secure it to the lath or sheathing of the roof. This is accomplished by raising a boss or projection upon the plates, and over this a cup, upon the crown of which is an orifice through which the screw is inserted. The head of the screw, and the champered socket in which it is inserted, are then further covered by a screw cap.

Claim.—The combination of the raised portion or boss, made upon the upper or both plates, the screw or bolt C, the washer B, the opening in the side washer being closed at the top by a cap D, or by other means which shall answer the purpose.

No. 37,451.—CHARLES LEAVITT, of Cleveland, Ohio.—*Improvement in Carriage Hub*.—Patent dated January 20, 1863.—The improvement is in the manner of covering in and securing the burr on the end of the pipe or spindle, and consists of a cap having a thread on its inner cylindrical edge which screws into the end of the axle box until a flange or shoulder comes in contact with the end of the hub. The central portion of this metallic cap has a hole for the insertion of grease, and when it is closed by a screw the end of the spindle and the burr are securely boxed in.

Claim.—The cap I, shoulder I', chamber J, and hole L, when combined with the pipe box B, all the parts being arranged and operating as and for the purpose herein set forth.

No. 37,452.—JOEL LEE, of Galesburg, Knox county, Ill.—*Improved Washing and Wringing Machine*.—Patent dated January 20, 1863.—In this combined machine the clothes are first rubbed between the convex rubber and the concave disk, both armed with slats or rollers, and are then passed between wringing rollers, in which the upper one is held down upon the lower by means of a link and weighted lever.

Claim.—The combination of oscillating arms E with the rubber B, the rollers L, the link I, and weighted levers C, all arranged substantially as and for the purposes specified.

No. 37,453.—C. LIEBRICH and L. UITTING, of Philadelphia, Pa.—*Improved Belt-Fastener*.—Patent dated January 20, 1863.—Two eccentric rollers are journaled into plates, and the surfaces more distant from their centre of rotation are serrated, the ends of a strap being brought between the rollers, the smooth surfaces being presented, they are rotated and bind the ends of the strap firmly between their serrated edges.

Claim.—The plates C and C', and eccentric rollers B and B', each roller having a portion of its surface grooved or serrated, and the whole being arranged for application to the two ends of a belt, as and for the purpose herein set forth.

No. 37,454.—SAMUEL N. MAXAM, of Shelburne Falls, Franklin county, Mass.—*Improvement in Sinks*.—Patent dated January 20, 1863.—The pan upon and in which the appliances are placed has a square depression at one end, and a round one at the other, the latter forming a basin with a discharging orifice in the centre. A movable sliding grate rests upon the bottom of the pan, and above this another grating with transverse wooden bars. A washbowl pivoted to a yoke slides upon a rod at one end, and may be swung over the sink or outside at pleasure.

Claim.—The combination and arrangement of the top slide grate A with the transverse wooden bars F, and the lower slide grate B, and the basin C, and the movable washbowl D, resting in and upon the yoke E, and sliding upon the rod G, for the purpose of a sink, and as above set forth.

No. 37,455.—G. B. McDONALD, of Louisville, Ky.—*Improvement in Steam Boilers*.—Patent dated January 20, 1863.—Passing through a stuffing box at the end of the boiler is a rod, to the inner end of which is a brush, which, by being moved backwards and forwards lengthways of the boiler, brushes the sediment into a mud well.

Claim.—The employment, conjointly with the mud well B of the boiler, of a brush C having an attached rod working through a stuffing box in one end of the boiler, and operating substantially as herein specified, for the purpose set forth.

No. 37,456.—JOHN C. MILLIGAN, of Elizabeth City, N. J.—*Improvement in Camp Kettles*.—Patent dated January 20, 1863.—This oval kettle is filled up with various utensils in such a way as scarcely to admit of a minute description within the limits of an abstract. Each larger utensil is made to contain the smaller vessels, and are surmounted by a frying pan, the lid forming a tureen.

Claim.—The peculiar construction of the dished cover or tureen B and its arrangement with the kettle A, and, together with the coffee-pot H, sauce-pan J, frying pan M, gridiron h, plates g, and ration boxes D E F, in the manner and for the purpose specified.

No. 37,457.—ROBERT MORRISON, of Newcastle-upon-Tyne, England.—*Improvement in Valve Gearing for Steam Hammers*.—Patent dated January 20, 1863.—Patented in England December 16, 1859.—The invention consists in so connecting the hammer and valve that the latter follows the motion of the former. At the upper end of the hammer bar is a roller which works in the slot of a curved link, which has a lever attached actuating the valve rod. The curve of this slot link may be regular or irregular, so that for a given motion of the hammer a corresponding motion may be given to the valve, or otherwise; and the valves are so arranged on their shafts as with a given motion to admit steam either above or below the hammer piston at any definite point, to vary the length of its stroke and to regulate the force of the blow.

Claim.—First, the use of a slot link, or its equivalent, to operate the valves of steam hammers for the purpose of maintaining the reciprocating motion of the hammer and valve in the same relative direction during any number of strokes, if so desired, or when less than the full motion of the valve is required, causing the parts, approaching contact to produce this motion, to move at a less velocity than the hammer, substantially as and for the purpose described.

Second, connecting the valve or valves of steam hammers to the slot link as described, or its equivalent, in such a manner that the whole or any portion of the motion due to the link or its equivalent may be imparted to the valve or valves, substantially as described and for the purpose specified.

Third, the use of a valve or valves in steam hammers, so connected with the hammer as to be capable of maintaining with it a continuous movement when the hammer and valve are at full stroke, whilst at the same time the relative positions of the valves and parts may be varied, substantially as and for the purpose specified.

No. 37,458.—ISAAC PEACOCK, of Shortsville, Ontario county, N. Y., assignor to Himself and S. S. SAWYER, of the same place.—*Improvement in Making Steel Horseshoes*.—Patent dated January 20, 1863.—The shoe is formed upon an inner die, having a central block of the shape desired, mounted upon a movable axis, and having punches operated from below to make the nail-holes.

The outer die is operated by a rack and pinion from any prime mover, and is pushed against the bar of metal, turning it around the forming die, and holding it while the nail-holes are punched.

Claim.—The combination of the forming die A A1, having detachable punches and a shifting axis, and the pivoted jaws D D, having inclined planes and shoulders on their outer edges, and the compressor and expander E E, having the wedge hooks *h h* and holding-down flanches or ledges on the front portions, substantially as described or the equivalent thereof for the purpose set forth.

Second, making steel horseshoes of the construction represented by a combination of machine and hand work, substantially as described.

No. 37,459.—NORTON PORTER, of Youngstown, Niagara county, N. Y.—*Improvement in Wrenches*.—Patent dated January 20, 1863.—The shank of this wrench has a serrated edge, and within the socket that traverses upon it is a slide with similar serrations; pivoted in lugs on this socket is an eccentric with a thumb-piece attached, which, when brought into action, presses down the serrated slide so as to make it mash into the teeth on the shank and prevent the motion relatively of the jaws until the slide is raised.

Claim.—The slide E fitted in the socket D of the jaw C, and provided with a serrated inner surface *h* and an eccentric *c*, with a thumb-piece *e* attached, in combination with the serrated surface *i* of the shank A, all arranged as and for the purpose herein set forth.

No. 37,460.—GEORGE B. RANSOM, of Chester, Middlesex county, Conn.—*Improved Meat Boiler*.—Patent dated January 20, 1863.—This improvement consists of a pair of hinged metallic pans with handles; from the floor of each of the pans rise points or ribs, and the meat being laid upon these in one pan, the other is shut down and the meat held between them, out of contact with the surface of the pan.

Claim.—A meat boiler constructed substantially as above described, so as to enclose the meat or other article, and boil the same without close contact with the bottom or top of the boiler, substantially as set forth.

No. 37,461.—JOHN SCOTT, of Lawrenceville, Alleghany county, Pa.—*Improved Car for Carrying Petroleum*.—Patent dated January 20, 1863.—This car is lined with sheet metal and has longitudinal and transverse vertical partitions, which have perforations near their lower edges to admit of the filling and emptying of all simultaneously, but prevents it from swaying back and forth and splashing.

Claim.—The employment of a railroad car A lined with sheet metal, substantially as herein described, for the purpose of carrying on a railroad petroleum or other liquid in the bulk.

Also, the arrangement of the partitions *e f*, perforated near the bottom with holes *h* in the interior of the car A, as and for the purpose specified.

No. 37,462.—SAMUEL J. SEELY, of Brooklyn, N. Y.—*Improvement in Machines for Bending Corrugated Sheet Metal*.—Patent dated January 20, 1863.—The object is to form cylinders of corrugated sheet metal in which the corrugations shall be around their circumferences, and not longitudinal, and to remove the cylinder endways from the roller without springing it.

Four corrugated rollers are placed in a frame and driven by gearing, the wheels at the opposite ends being connected by a central shaft. The upper and lower rollers are journaled in levers which, by suitable mechanism, are raised or lowered to adjust them relatively to each other, and to free one end so as to slip the corrugated cylinder off the roller on which it is formed. The rollers may be in sections for adapting them to work requiring an inverted or flanged edge.

Claim.—First, the combination of four rollers, corrugated around their circumferences, in a machine for bending corrugated sheet metal into corrugated cylinders, substantially as described.

Second, the arrangement of four corrugated rollers, so that the corrugations of one mesh into the corrugations of another, and all are driven by a positive motion and from a central shaft, substantially as and for the purposes set forth.

Third, the arrangement of the machine so that the corrugated rollers may be adjusted with respect to one another, and so that the corrugated cylinders may be removed endwise from the rollers, substantially as described.

Fourth, the construction, arrangement, and combination of the adjustable parts B B1 B2 B3, stationary parts A A1 A2 A3, rollers C C1 C2 C3, rock-shafts I I', worms J J, and segments K K, substantially as and for the purpose set forth.

Fifth, the combination of one or more movable sections *b c* with the permanent corrugated portions of the roller surface, the said sections being adapted for finishing large or small casks with a plain flange or chine being inverted, substantially as and for the purpose set forth.

No. 37,463.—ISAAC B. SNYDER, of Clay Township, Lancaster county, Pa.—*Improvement in Raking Attachments for Harvesters*.—Patent dated January 20, 1863.—This raking attachment is operated from a quarter-cogged wheel on the main shaft which turns a pinion, and, by means of connexions, causes a rake to come quickly forward and rake the grain off the platform. These two motions are effected in one-quarter of the time occupied by the revolution of the driving wheel, and the rake is at rest, at the point of its discharge, the balance of the time, with its roller lying in a depression of the inclined plane which elevates it so as to let the grain drop vertically to the ground.

Claim.—The specific arrangement of the inclined planes O P for giving the necessary elevation to the sweep rake at each end of its stroke, in combination with the means of holding the rake during its interval of rest, and operating it in the manner specified.

No. 37,464.—SAMUEL B. SPAULDING, of Brandon, Vt.—*Improvement in Stoves for Boiling Sap*.—Patent dated January 20, 1863.—This evaporator consists of a furnace surmounted by a kettle, around which is a metallic casing forming a hot-air chamber or flue; an annular ring sets on the top of the furnace, and on this is the kettle; the heat rising strikes the middle of the kettle, and by flue plates is deflected right and left and through openings into the chamber around the sides of the kettle, from whence it passes to the stove-pipe.

By opening the damper the heated air passes immediately to the flue.

Claim.—The peculiar air-chamber C, in combination with the stove A and boiler D, the bottom of the latter being embraced by the fire space E and flues, whilst its upper part is embraced by the top of the hot-air chamber, substantially in the manner and for the purposes set forth.

No. 37,465.—C. E. STELLER, of Genesee, Waukesha county, Wisconsin.—*Improvement in Seeding Machines*.—Patent dated January 20, 1863.—This machine is made adjustable for different sizes of seed, and has a rotary cylinder with rows of different sized adjustable seed holes revolving immediately under a transversely adjustable slide provided with rows of openings so as to correspond with and fill either of the sets of seed cells in the cylinder.

The machine has an inner hopper in addition to the usual one, so that small seed may be sown with larger—as grass seed with wheat, or clover with oats; this smaller hopper is situated above the slide and discharges with the other grain through the orifices in the slide into the cells of the roller.

Claim.—First, the arrangement of one or more transversely adjustable slides G G1 G*, with two or more sets of holes or apertures *b' c' a' a**, in combination with the seed-distributing roller E rotating close under said slide or slides, and provided with adjustable seed-cells *a b c*, all constructed and operating in the manner and for the purpose described.

Second, the arrangement of the secondary hoppers H*, in combination with the main hopper H, slide G*, and seed distributing roller F, constructed and operating as and for the purpose specified.

No. 37,466.—RICHARD STILEMAN, of Philadelphia, Pa.—*Improvement in Hydrants*.—Patent dated January 20, 1863.—At the foot of the fire-plug where the water main or pipe assumes a horizontal position is a sluice valve working vertically in a casing under the impulse of a screw operating by a key from above; this, when retracted, is completely out of the way, forming no impediment to the flow of water.

Claim.—The sluice valve D, with its casing C C', when combined with and arranged in respect to the stem A of a fire-plug, as and for the purpose set forth.

No. 37,467.—THOMAS C. VICE, of New Haven, Conn.—*Improved Apparatus for Stirring and Drying Grain*.—Patent dated January 20, 1863.—This machine consists of a platform and a movable carriage carrying stirrers.

The bed of the platform is formed of iron bars with projecting lugs or ledges on their sides supporting cast-iron plates with slots in them; the carriage has a rack into which a pinion gears, giving it a reciprocating motion, and the stirrers or scoops pass back and forth ploughing up the grain to expose it to the air.

Claim.—First, the arrangement of the cast-iron tiles C forming the platform of a machine for drying grain, &c., in combination with ledges or lugs *a* projecting from the beams B, as and for the purpose shown and described.

Second, the arrangement of several rows of semicircular scoops H, either rigid or adjustable, in combination with the reciprocating carriage E and tiles C, all constructed and operating substantially as and for the purpose specified.

No. 37,468.—LOWELL WILBER, of Putney, Windham county, Vt.—*Improvement in Brake Mechanism for Carriages*.—Patent dated January 20, 1863.—The holding back of the horses upon the neck yoke draws a chain which passes around a pulley on the end of the tongue, and operates a rod under the tongue, which in turn draws upon a chain which passes over two pulleys above the tongue hounds, pushes a sliding bar on the coupling pole, and operates the lock bar, thrusting the rubber blocks against the wheels.

Claim.—The application or arrangement of the slide bar G, its spring H, chain *b*, and pulleys *c d*, relatively to the perch E E' and the rocker bar C, the front axle A, and the tongue J, provided with a draught rod I, operated by the chain *f*, connected with the yoke or bar L, and going around a pulley *e*, as described.

No. 37,469.—WILLIAM J. WILCOX, of New York, N. Y.—*Improved Machine for Stirring Lard*.—Patent dated January 20, 1863.—This stirrer operates in a rectangular tank and consists of two sets of dashers hinged to arms and suspended from rods to which a reciprocating motion is given by a two-throw crank, so that the dashers suspended from the respective rods shall move in opposite directions.

Claim.—The employment or use, for the purpose of stirring lard, of flat perforated dashers E E', attached by hinge joints to staves F F', which are secured to reciprocating rods C C', moving in opposite directions, all constructed and operating substantially in the manner and for the purpose herein shown and described.

No. 37,470.—FREDERICK WILLIS, of Marathon, Cortland county, N. Y.—*Improvement in Extension Ladders*.—Patent dated January 20, 1863.—This ladder is made in sections or lengths which are attached by bands, and slip upon each other by means of cords and pulleys; the upper section being jointed so as to be laid on the roof of a house.

Claim.—Making a hinge joint in the upper section of the ladder so that the part above the joint may be laid on the roof of a house substantially as described.

Also, in combination with the jointed section, the other sections provided with the devices described for raising or pushing them up in succession substantially as described.

No. 37,471.—DUDLEY B. CHAPMAN, of Milford, Worcester county, Mass., assignor to Himself and EBENEZER D. DRAPER of same place.—*Improvement in the Manufacture of Soap*.—Patent dated January 20, 1863.—This improvement is fully explained in the claim.

Claim.—As an improved manufacture, a soap made in the improved manner hereinbefore described, viz., of a hot fatty matter or matters and a solution of alkaline silicate combined at one operation without the process of being boiled after the addition of the solution of silicate to the hot fat.

No. 37,472.—DANIEL B. CLEMENT, of Milton, Norfolk county, Mass., assignor to Himself and DANIEL A. SCHERMERHORN, of Boston, Mass.—*Improved Clothes Wringer*.—Patent dated January 20, 1863.—The journals of the lower roller rest upon wedge-shaped blocks, which by being drawn in or out raise it in its bearings; this motion is given by screws, which likewise depress the clamps upon the sides of the tub.

Claim.—First, raising or lowering the journals of the lower roll B, for the purpose of applying or releasing the pressure, in the manner substantially as set forth.

Second, moving the bearings *d*, by the same power which opens or closes the clamps D, substantially as described.

No. 37,473.—FREEMAN GRAHAM, of Rockford, Winnebago county, Ill., assignor to RALPH EMERSON, jr., of same place.—*Improvement in Pitmans*.—Patent dated January 20, 1863.—This pitman, with a cast-iron head, but wrought-iron arm or shank, is especially adapted for use when rapidly vibrated as in a harvester. In such situations a wrought-iron head enclosing the wrist pin is apt to cut out more rapidly, while cast-iron is unfit for the shank, as it is subject to jars and strains.

Claim.—A pitman composed of a cast-iron head to sustain friction, and a wrought-iron arm to resist strains, when constructed and combined substantially in the manner described.

No. 37,474.—CHARLES W. S. HEATON, of Belleville, St. Clair, county, Ill., assignor to JABEZ I. PIGGOTT and H. RENTCHLER, of same place.—*Improvement in Cultivators*.—Patent dated January 20, 1863.—This cultivator consists of a frame on wheels with a seat for the driver; above this, an upper frame is supported by links, and from it the plough standards are suspended by ropes which are attached to arms on a rock shaft. The various combinations are explained at length in the claims and shown in the drawings.

Claim.—First, a cultivator frame, folding and expanding vertically on the plan of a parallel rule, substantially as and for the purposes described.

Second, the combination of the slotted beams B B, slotted links O O, and vertically folding and expanding parallel rule frame, substantially as and for the purposes described.

Third, the combination of the elevated cultivator frame A A1 A2 A3, clutch pulley H, or its equivalent, propelling wheels E, cross-shaft F, and pendent cultivator beams Q', substantially as and for the purposes set forth.

Fourth, the combination of the ratchet wheel, lever pawl and brake with the pendant cultivator beams, substantially as and for the purposes set forth.

Fifth, the combination of the lever M, with the pawl, brake, ratchet wheel, and pendant cultivator beams, substantially as and for the purpose set forth.

Sixth, the combination of the swinging lever P and pendant cultivator beams in a machine operated substantially as herein described.

Seventh, guards or poles 6, in combination with a back yoke 8, as set forth, or the equivalent thereof.

Eighth, the poles 6, when applied and used for the purpose set forth.

Ninth, the back yoke 8, when applied and used as and for the purpose set forth.

Tenth, in a cultivator for cultivating growing crops, and which employs pendant beams Q', and a vertically expanding and folding parallel rule frame, the combination therewith of the adjustable standard 3 and adjustable brace 4, made in two pieces and with a loose joint, substantially in the manner and for the purpose described.

Eleventh, the arrangement together on the same machine of the ratchet wheel K, the brake N, and foot and hand levers M L I, and P all combined as shown and described.

No. 37,475.—JOHN KUEBLER, of Belleville, St. Clair county, Ill., assignor to J. I. PIGGOTT and HENRY RENTCHLER, of same place.—*Improvement in Presses*.—Patent dated January 20, 1863.—The arrangement of this press is such that the screw may be revolved rapidly while the nut remains stationary so long as the follower is suspended from the screw; and also that the nut may be revolved slowly while the screw remains stationary, when the follower has come in contact with the article to be pressed and the screw is pressing upon it. This is accomplished by a changeable connexion between the end of the screw and the follower, by which the round portion of the socket is in contact with the round end of the screw, while the follower is suspended and admits of the screw being revolved; but when the screw rests with force upon the follower, the square portion of the socket and of the screw come into position and hold the screw while the nut is revolved.

Claim.—The construction of a press or other similar mechanical power in such manner that the screw and nut may be alternately revolved, and when thus revolved the connexion between the follower and the screw will automatically adapt itself thereto, substantially as and for the purposes set forth.

No. 37,476.—JOHN E. SEAVEY, of Kennebunkport, York county, Maine, assignor to Self and GEORGE E. TORREY, of same place.—*Improved Jib and Stay Connexion*.—Patent dated January 20, 1863.—The claim and drawings clearly explain this invention.

Claim.—My improved jib and stay connector, the same consisting of the hinged annulus B and the shackle A, constructed, arranged, and combined together in manner and so as to operate as specified.

No. 37,477.—ABEL THOMPSON, of Brooklyn, N. Y., assignor to Himself and DANIEL RICHARDS, of New York, N. Y.—*Improvement in Casks and Barrels for Oil*.—Patent dated January 20, 1863.—These casks are formed with a bulge, and are lined throughout with sheet metal, including the bung-hole, which has a screw socket attached to the cylindrical inner casing. The staves are connected with each other by intervening plates and points to secure them in their relative cylindrical position.

Claim.—Lining a barrel or cask for petroleum or coal oils with sheet metal, said lining setting against the interior of the barrel or cask, for the purposes and as specified.

The metal screw bung-hole *c*, attached to the cylinder *a*, and passing through the staves, for the purposes specified.

The wings *e e*, attached to the cylinder *a*, and running between the staves, for the purposes specified.

Also, the staves formed as segments of a cylinder, tapering on the outside, and receiving the wooden heads and the hoops to form a barrel or cask, as set forth, in combination with an interior lining, whereby said barrel or cask is adapted to contain coal oil, as specified.

No. 37,478.—DARIUS WELLINGTON, of Boston, Mass., assignor to CORNELIUS WELLINGTON, of same place.—*Improvement in Washbasin Faucets*.—Patent dated January 20, 1863.—The object of this improvement is to prevent leakage from the joint, or from the discharging orifice, running down upon the outside surface of the faucet, or upon the stand in which the washbowl is set when the water is turned off by the partial rotation of the spout. This is effected by making a communication between the chamber to which the nozzle is attached and a discharging pipe at the level of the stand, which intercepts and discharges all mere leakage water which may remain or accumulate in the passages.

Claim.—The improved basin faucet, as constructed with the leakage intercepting chamber *a* and its conduit *b*, arranged within the standard A, and with respect to the joint of the movable nozzle B and the plug *c*, substantially as specified.

Also, in combination with the leakage intercepting chamber *a* and its outlet *b*, arranged on the stand A of the faucet, as specified, the auxiliary intercepting chamber *e*, or its equivalent, and the conduit *g*, or its equivalent, in the turning nozzle B, the whole being arranged to operate together, substantially as and for the purpose or objects as hereinbefore set forth.

No. 37,479.—HARMON G. WEIBLING, of Denver city, Arapahoe county, Colorado Terr.—*Improvement in Axles*.—Patent dated January 20, 1863.—This axle box is constructed with flanges at its outer and inner ends, and with an oil chamber on the top, just clear of the hub, which trickles its contents into the end of a spiral groove in the spindle, keeping the working surfaces lubricated.

Claim.—The peculiar construction of my axle boxes or thimbles with the flanges H R, oil chamber F, and aperture l, when connected with a spiral groove, terminating in a canal in which are placed friction rollers e, the whole combined and operating as described.

No. 37,480.—HARMON G. WEIBLING, of Denver city, Arapahoe county, Colorado Territory.—*Improvement in Carriage Wheels*.—Patent dated January 20, 1863.—The thimble in this improvement is made with recesses in its shoulder for rollers to lie in, to avoid the friction of the inner end of the hub; and with a strap skein under the lower side, fastened with a nut at the point of the thimble skein and bolted to the axle inside of the band; it has also longitudinal lubricating grooves on the spindle for the retention of grease.

Claim.—My peculiar method of constructing the axle boxes or thimbles, and attaching them to the axles by means of the gutta-percha packing A and screws, when the boxes or thimbles are made to taper, as described, having a canal lined with Babbitt's metal, in which rollers e are placed, the whole used in construction with the strap d on the under side of the axle and the bolt j, the friction rollers, spiral groove, and lubricator, all as described and set forth.

No. 37,481.—CHARLES R. ALSOP, of Middletown, Conn.—*Improvement in Cartridges*.—Patent dated January 27, 1863.—A tube of rubber is charged with powder and shot, separated from each other by a paper disk. A wad, covered with tallow, is inserted over the shot, and is secured by overlapping the ends of the tube.

Claim.—As a new article of manufacture, a powder and shot cartridge, constructed in the manner and for the purpose set forth.

No. 37,482.—H. A. AMELUNG, of Chicago, Ill.—*Improvement in Separating Fatty Matter from Animal Substances*.—Patent dated January 27, 1863.—This invention consists in the appliance of heat during the grinding and mashing of animal substances, whereby fatty matter is more rapidly and effectually separated than by grinding and mashing, or by boiling alone.

Claim.—The separating of fatty matter from animal substances by subjecting the same to a gentle heat during the crushing, grinding, or comminuting of the same, in the manner substantially as herein set forth.

No. 37,483.—AMOS C. BARSTOW, of Providence, R. I.—*Improvement in Teakettles*.—Patent dated January 27, 1863.—The invention consists in making depressions in the rims of cast-iron teakettles, with corresponding hooks on the lid, by which the lid may be secure from falling off except at the identical point of entry.

Claim.—The formation of depressions in the rim of cast-iron teakettles, in combination with a flanged cover having corresponding pendent hooks, the whole being constructed and arranged substantially as described to operate in the manner and for the purposes set forth.

No. 37,484.—AMOS C. BARSTOW, of Providence, R. I.—*Improvement in Metallic Burial Cases*.—Patent dated January 27, 1863.—This invention consists in making the surface of the lower shell in two planes, which meet at the point of greatest width, and the lid agreeing in form thereto.

Claim.—The method herein described of constructing metallic burial cases, by dividing the upper shell or covering lid from the lower shell, according to a line situated in two planes, forming an angle at that part of the case which presents the greatest width transversely.

No. 37,485.—AUGUSTUS A. BENNETT, of Cincinnati, Ohio.—*Improvement in Cartridge Box*.—Patent dated January 27, 1863.—This invention consists in operating automatically the cover of a cartridge box by one or more springs suitably located.

Claim.—The cartridge box A B, whose cover C D is made self-closing by means of one or more metallic springs H H', constructed, adapted, and operating in the manner described.

No. 37,486.—BENJAMIN S. BENSON, of Baltimore, Md.—*Improvement in Sounds for the Uterus*.—Patent dated January 27, 1863.—The invention consists in the combination in one instrument of a uterine sound and a porte caustic, whose limb is indexed in combination with a graduated slit in the tube as a measure of the amount of powder to be applied.

Claim.—First, the combination in one instrument of a uterine sound and porte caustic as described.

Second, the combination and arrangement of the tube A, piston E, index F, and graduated slit G, in the manner and for the purpose specified.

No. 37,487.—ISAAC BICKHART, of Harlan, Allen county, Ind.—*Improvement in Boot and Shoe Blacking Apparatus*.—Patent dated January 27, 1863.—The invention consists of revolving brush wheels with a yielding support for the boot.

Claim.—The revolving brush wheels E E, one or more constructed substantially as shown, in combination with the yielding foot-stands D D, arranged substantially as and for the purpose herein set forth.

No. 37,488.—JOHN C. BIRDSELL, of West Marietta, Monroe county, N. Y.—*Improvement in Clover Thresher and Huller*.—Patent dated January 27, 1863.—The object of the invention is to complete the "getting out" of clover seed by one operation, and this is accomplished by placing a threshing concave above, and a hulling concave below, the seed being fed in over-shot. With this is combined hulling or roughened surfaces between the teeth on the cylinder, on the concave, and on the teeth; the ribs on the picking cylinder are on a perforated screen, to assist in separating the seed from the chaff, and the crank shaft arranged to operate the bolt at the rear of the machine.

Claim.—A rotating threshing and hulling cylinder with a threshing concave or arch above and a hulling concave or arch below, substantially as described, so as to thresh the seed from the straw and stalks, and hull it at one operation with one and the same cylinder.

Also, providing a toothed threshing cylinder with a rough or hulling surface between the teeth.

Also, in combination with a toothed threshing cylinder having a roughened or hulling surface between the teeth, a ribbed concave or arch, with a roughened or hulling surface on the face of the ribs, with grooves between the ribs for the threshing teeth of the cylinder to travel in or through, substantially as described.

Also, in combination with a picking cylinder, the ribs on a perforated, concave screen, to hold up the straw and stalks, and allow the bolls and seed to fall through the screen, and prevent the straw and stalks from dragging or carrying the bolls and seed across the holes in the screen.

Also, arranging the crank shaft to operate the bolt at the rear end of the machine when said crank shaft is also used to carry the conveying apron or belt K', substantially as described.

No. 37,489.—WILLIAM U. BOHM, of San Francisco, Cal.—*Improved Buckle for Waist Belt*.—Patent dated January 27, 1863.—This buckle consists of the usual rim and a rod behind it, (as it is worn,) which has holes for the entry of the teeth of a clasp, which is hinged to the rim, and opens forwards. Between the rim and the rod the belt is slipped, and the clasp being pushed down and fastened, retains it in position.

Claim.—The entire machinery of the buckle (with the exception of the rim) as set forth in the foregoing specification, together with the application and use of said machinery, to the purposes set forth in the petition and specification.

No. 37,490.—HOWARD C. BRISTOL, of Chicago, Ill.—*Improved Letter Envelope*.—Patent dated January 27, 1863.—There is one more section to this envelope than usual, which consists of a fair surface lap that covers the ordinary angular joints on the back of an envelope, and it is lapped over and fastened on the front. At the centre of the upper edge of the letter, a hole is left in the envelope, so that while the letter is exposed, the sealing or attachment of the stamp fastens it in its cover as well as secures the parts of the envelope together, and thus the letter is fastened as well as enclosed.

Claim.—First, a letter envelope having sealing laps *b b*, substantially as and for the purpose set forth.

Second, providing the body portion of an envelope with an opening or perforation as at *d*, so that when the letter stamp is placed over the same, a portion of said stamp will adhere to the inner sealing lap, substantially as and for the purpose described.

No. 37,491.—LEWIS B. BRUEN, of Brooklyn, N. Y.—*Improvement in Shot Cartridges*.—Patent dated January 27, 1863.—A casing being made of muslin, and filled with shot, it is dipped in collodion and dried in the air; the wads are attached to the cartridge before dipping, and dried with them, or afterwards attached by glue or cement.

Claim.—First, the method herein described of forming bird and buck-shot cartridges by dipping cases filled with shot in collodion, in the manner and for the purposes herein set forth.

Second, in combination with the above, the use of wads made in the manner and for the purpose set forth.

No. 37,492.—CLARK O. BUSH, Michigan Bluff, Placer county, Cal.—*Improvement in Water Elevators*.—Patent dated January 27, 1863.—This elevator consists of a series of larger buckets operated by a fall of water, and upon the same shaft which they pass over is another smaller set of buckets which elevate water from a lower to a higher level.

Claim.—First, the endless chains of buckets B and inclined troughs or conduits *f*, in combination with the endless chain of buckets A, when the latter is operated by the water lifted by the former, as specified.

Second, the curb *H*, splash boards *c c*, and inclined trough or conduit *f*, in combination with the endless chain of buckets *A*, when arranged to operate in the manner and for the purpose specified.

No. 37,493.—C. BYRNE, of Kingsville, Ashtabula county, Ohio.—*Improvement in Railroad Switch Lanterns*.—Patent dated January 27, 1863.—The body of the lamp is double, forming an annular chamber, the air being admitted by holes through the outer plate, and the smoke discharged at a ventilator hole in the roof, so as to insure combustion of the mineral oil by a direct current of air; the oil-cup is supported upon springs, and surrounded by elastic packing to avoid concussion or jarring of the passing train, and the sliding window frames made double and practically air-tight so as to secure combustion of the mineral oil.

Claim.—First, constructing the body of the lamp practically air-tight with the double walls *F F'*, and openings *G* and *P* and *P'*, for the purpose specified.

Second, supporting the oil-cup and wick upon delicate springs, and surrounding the same with elastic packing, as and for the purpose set forth.

Third, the double grooves for the sliding panel for the purpose described.

No. 37,494.—JONATHAN S. CHATHAM, of Seneca Falls, N. Y.—*Improved Composition for Water Pipes, &c.*—Patent dated January 27, 1863.—After removing the inflammable portions of coal tar, the residuum is stirred up with clean sand so long as the tar will receive it, and composition thus obtained cast into the required form.

Claim.—The composition above described, consisting of the residuum of the burned coal tar and sharp sand, prepared and compounded substantially as and for the purposes specified.

No. 37,495.—HENRY N. DEGRAW, of Newburgh, Orange county, N. Y.—*Improved Device for Adjusting Wicks in Lamp Tubes*.—Patent dated January 27, 1863.—This invention consists of a pair of tongs with sharp forked ends, a spring at their point, and a sliding ring by which the wick in the narrow flat passage of a burner may be introduced, flattened, and adjusted.

Claim.—The implement or device constructed as herein shown and described, to wit, of a wire or rod bent so as to form two arms *a a*, and a spring *b*, with a slide *c*, placed on the arms, for the purpose set forth.

No. 37,496.—L. A. ENSWORTH and B. BARKER, of Williamsport, Lycoming county, Pa.—*Improved Machine for Edging Lumber*.—Patent dated January 27, 1863.—The lumber is fed endwise upon a bed, on each side of which is a circular saw; one in a fixed frame, and the other in an adjustable frame, so as to be set at any required distance from each other by the rack and pinion.

Claim.—The arrangement of the two saws *E F*, upon independent arbors *C G*, placed upon the same plane, opposite to each other, with an open space between them; the saw *F* being made laterally adjustable, all as herein shown and described.

Also, the combination of the two independent saws and arbors with the adjustable frame *H*, rack *b*, pinion *I*, frame *N*, and rollers *L L M M*, all in the manner herein shown and described.

No. 37,497.—A. H. EMERY, of New York, N. Y.—*Improvement in Founding*.—Patent dated January 27, 1863.—To secure the gradual cooling of the casting, it is enveloped with a casing of molten metal, a thin mould intervening between the casting and its metal envelope.

Claim.—The process of retarding the cooling of any part or portion of a casting during the process of founding by means of a casing or envelope of melted metal covering surrounding such parts and portion of the casting as may in any case be desired, and separated therefrom by a thin mould, substantially as and for the purpose herein described and set forth.

Also, the arrangement of the sleeve *k*, or its equivalent, with the coal barrel *D*, for the purpose of retarding the cooling of the sinking-head and chase of gun-castings, arranged substantially as and for the purposes herein described and set forth.

No. 37,498.—SAMUEL H. DUDLEY, of Milton, Litchfield county, Conn.—*Improvement in Dirt Scraper*.—Patent dated January 27, 1863.—The improvement in this scraper consists in attaching a transverse bar to the handles, and by a rod to the scraper, so as to catch the latter upon the draught hooks when upset, and prevent it falling flat on the ground and breaking the handles or accumulating dirt on the back of the scraper.

Claim.—The arrangement and combination of the bar *B*, and the rods *P* and *P*, with the bows *H* and *H*, or their equivalents, for the purpose and in manner as above set forth.

No. 37,499.—LEVI FLEISCHMAN, of Rochester, N. Y.—*Improved Device for Holding Clothes in Trunks*.—Patent dated January 27, 1863.—Affixed to the ends of the trunks, inside, are vertical guides, on which a bar with slotted ends is adjusted vertically and held down by pins. Underneath this bar is a spread, or cloth, with transverse slats, and this being placed over the clothes, they are packed down firmly and held so as to admit of other lighter articles being laid over without danger of being crushed when the trunk is turned upside down.

Claim.—The combination of the adjustable bar or bars B, guides C C, and pins *d d*, with a trunk or valise, when they are used in the inside of the same, for the purpose of packing clothes and holding them during transportation, the whole arranged and operating substantially as herein set forth. In combination with the bar B, the spread D, constructed and arranged substantially as specified.

No 37,500.—PETER FONTAIN, New York, N. Y.—*Improvement in Gas Regulators and Purifiers.*—Patent dated January 27, 1863.—The invention consists in providing the enlarged double conical chamber with an outlet and stopper, by which the purifying materials contained in said chamber may be extracted, and fresh materials introduced.

Claim.—The opening or outlet D, (provided with a suitable stopper.) in combination with the chamber C and its contents, substantially as and for the purpose set forth.

No. 37,501.—LEONARD GEIGER, of Hudson, Columbia county, N. Y.—*Improvement in Breech-loading Fire-arms.*—Patent dated January 27, 1863.—The improvement consists in the arrangement of the breech-piece and hammer, which are both pivoted to the side plates of the lock chamber, and are retracted by backward vibration to cock and load. They are provided with shoulders so arranged that when the piece is fired the hammer shall impinge upon the rear of the breech-piece to brace and sustain it against recoil.

Claim.—Combining the swinging breech C and the hammer E, by means of suitable shoulders *d e* on each, in such a manner that the hammer is made to form a brace to brace and lock the breech against the back pressure consequent upon the explosion of the charge, substantially as herein specified.

No. 37,502.—W. O. GROVER, of Boston, Mass.—*Improvement in Sewing Machines.*—Patent dated January 27, 1863.—The invention consists of a clevis-shaped vibrating arm, which is pivoted in the centre of its bend, and oscillates vertically, the upper one of its extremities being furnished with a needle, and the other one being connected with the horizontal shaft immediately under the feed plate, and also with the driving mechanism.

Claim.—A long, bent vibrating arm, one of whose ends drives a needle in combination with a horizontal shaft arranged under the feed and actuating the feed when that same shaft is also connected directly to one end of such bent arm extending under the spot where the needle perforates the cloth, or nearly so, the whole arranged, connected, and acting substantially in the manner and for the purposes hereinbefore set forth.

No. 37,503.—STUART GWYNN, of New York, N. Y.—*Improved Steering Apparatus.*—Patent dated January 27, 1863.—The object of this invention is to bring an elastic force to bear upon the rudder, so that when the blade of it is struck by a cross sea, it shall not by its rigidity expose the rudder to fracture, or the helmsman to injury. This is effected by annular elastic springs on the shaft of the tiller screw, so that while the action of the prime mover is uniform, the motion of the rudder-head is modified by the degree of resistance.

Claim.—The mechanism herein described for imparting to the rudder-head the requisite motion according to the resistance to be overcome, so that while the action on the prime mover is uniform, the rudder-head will rotate with more or less speed as the resistance increases or decreases, substantially as set forth.

Also, the combination with the rudder-head of a pintle, extending upwards in line with the axis of the rudder-head and supporting said pintle by a suitable overhead frame, substantially as herein shown and described.

Also, applying the tiller to the rudder-head between two points of support thereof, said tiller being operated from a screw shaft having annular rubber springs arranged upon it substantially in the manner and for the purpose set forth.

No. 37,504.—NOAH E. HALE, of Nashua, Hillsboro' county, N. H.—*Improvement in Machines for Making Roving.*—Patent dated January 27, 1863.—The sliver passes through the trumpet mouth of a lever, and between a stationary and a gravitating jaw, which latter is hinged to the lever. From these, it passes to the draught rollers and is drawn to such an extent as to keep the tail of the trumpet-mouthed lever out of the way of collision with the arm of a rocker-shaft which rotates below. When a sliver breaks, the tail of the lever falls and arrests the revolution of the rocker-shaft, while other appliances are operated which turn the driving belt from the fast to the loose pulley, and stop the machine.

Claim.—The stationary and gravitating jaws *c d*, or their mechanical equivalent, in combination with the trumpet guide A or A', and a stop motion or mechanism connected therewith, and operating substantially in manner and for the purpose as specified.

Also, the combination of the crank S, the connecting rod R, or mechanical equivalents therefor, tri-armed lever K, latch-lifter L, and disk I, with tappets *f g*, the same being applied to the armed rocker-shaft H, one of the draught rollers and the latch of the belt-shifter, in manner and so as to operate substantially as specified.

No. 37,605.—FRANK HENRY, of Bridgeport, Conn.—*Improvement in Hemming, Tucking, and Folding Guide, for Sewing Machines.*—Patent dated January 27, 1863.—This guide is

attached to the foot-piece and slips back and forth so as to be adjusted to the desired width of the lap, tuck, hem, or seam.

Claim.—The combination with the hem-turner *a b c*, and foot-piec *A*, of the adjustable guide *d*, constructed with shank *f*, bar *h*, plate *i*, all substantially in the manner herein shown and described.

No. 37,506.—BENJAMIN J. C. HOWE, of Syracuse, N. Y.—*Improvement in Mica Chimney for Lamp.*—Patent dated January 27, 1863.—The thin lamina of mica is surrounded by a light frame of sheet metal, and then bent so as to be slipped into the grooves of two posts which form the uprights of a chimney frame. A similar lamina is fitted to the other sides of the posts, and oval rings above and below are slipped on and secured to the posts to complete the chimney.

Claim.—The oval base Fig. 6, the construction of the frame as described, and the transferable sheets of mica *a a*.

No. 37,507.—WILLIAM W. HUSE, of Brooklyn, N. Y.—*Improvement in Tobacco Presses.*—Patent dated January 27, 1863.—The tobacco is laid in cells in the rim of a wheel, the partition between the cells being sliding gates operated by a cam; the wheel is then rotated against a pressure wheel which presses the tobacco in the cells and slides in the partitions so as to be retracted by the cam and free the pressed plug.

Claim.—The combination of the wheel of troughs or cells, the radial sliding partitions forming the ends of the cells, the cams for operating the sliding partitions, and the pressure wheel for rolling and pressing the plugs of tobacco in the cells, substantially as described.

No. 37,508.—WILLIAM W. HUSE, of Brooklyn, N. Y.—*Improvement in Machine for Pressing and Cutting Tobacco.*—Patent dated January 27, 1863.—The tobacco is placed upon the feeding chain or endless carrier, and from thence is taken by two endless belts and transferred to the pressure wheel, which has a deeply recessed periphery; in this the tobacco is pressed by a roller which enters the recess and brings the required pressure upon it. After leaving the point of pressure it becomes detached, and being suspended is fed down between a cutting and a plain surface roller, where it is divided into pieces of the required length.

Claim.—The wheel trough, that is, the wheel flanches each side of its periphery, into which the slivers of tobacco are to be placed and compressed in combination with the two endless belts or equivalent rollers, for introducing the slivers of tobacco to the trough-like periphery of the wheel, and the pressure roller for compressing the tobacco after it has been introduced into the trough-like periphery of the wheel, substantially as and for the purpose specified.

Also, the endless feeding chain substantially as described, in combination with the trough wheel, the two belts or equivalent rollers for transforming the slivers from the feeding chain to the wheel trough, and with the pressure roller for compressing the tobacco into the wheel trough, substantially as and for the purpose specified.

Also, in combination with the wheel trough and pressure rollers, a cutting mechanism, substantially as described for cutting the compressed sliver of tobacco into plugs of the required length, as set forth.

No. 37,509.—WILLIAM W. HUSE, of Brooklyn, N. Y.—*Improvement in Machine for Drying Tobacco.*—Patent dated January 27, 1863.—This machine consists of an upright rotating spindle with an alternate skeleton shelf and an annular clamp. The green tobacco plants are laid on the shelf with their butts toward the spindle, and their tops projecting radially; the clamp is then placed on them like a wide hoop, which retains them in position; then another shelf and another hoop, and so on. The spindle is then revolved at a high speed and the moisture driven out by centrifugal force.

Claim.—The combination of a series of clamps with the rotating spindle substantially as described, for securing the stems of tobacco leaves to the spindle, that they may be dried by centrifugal action, as set forth.

Also, the series of shelves on which to place the tobacco substantially as described, in combination with the series of clamps and the spindle, substantially as described.

No. 37,510.—SAMUEL KEELER, of Lancaster, Penn.—*Improvement in Apple Mills.*—Patent dated January 27, 1863.—The invention consists in the form of the tooth, which has a shoulder on each side, the transverse section resembling a triangle erected upon a trapezoid whose widest parallel side forms the base of the figure.

Claim.—The combination and construction of the double or compound toothing of the crushing cylinders *C D*, made in the manner and for the purpose specified.

No. 37,511.—ALFRED, JOHN and CHARLES LAMB, of Jeffersonville, Sullivan county, New York.—*Improvement in Device for Operating Churns.*—Patent dated January 27, 1863.—The improvement consists in so arranging the operating devices of a churn as to impart a reciprocating and rotary motion to the dashers; it is accomplished by forming the upper part of the dasher shaft with a worm or screw which works in a nut in an arm projecting over the central axis of the churn, which rotates the dasher as it is raised by the hand lever.

Claim.—The combination of the sliding nut E and arm F with the bar G, lever I, screw D', and dasher C', in the manner herein shown and described.

No. 37,512.—JOHN B. LEAROCK, of Boston, Mass.—*Improvement in Back Sights for Firearms.*—Patent dated January 27, 1863.—A vertical frame is attached to the breech of the gun by a screw, and within this frame is a sliding block with an eye-piece. The sides of the frame are graduated to make degrees of elevation on one side, and the ascertained elevation for distances in hundreds of yards on the other side. The vertical motion is given by a single screw under the slide, the shank of the elevating screw passing into the hollow screw by which the sight is secured to the breech.

Claim.—The arrangement of a single elevating screw C within the frame A and its support or holding screw a, and so as to enable the slider or carrier B and its eye-piece D to be either elevated or depressed by the revolution of one screw, as described.

No. 37,513.—ALVIN S. LYON, of Lawrence, Mass.—*Improvement in Shuttle Drivers for Power Looms.*—Patent dated January 27, 1863.—The rocket at the foot of the picker-staff has a curved base, on which it oscillates, a side flange projecting downwards over the base has a diagonal slot in which a stationary pin works as the rocker vibrates.

Claim.—In combination with flanged rocker the diagonal slot B and the fulcrum pin S, or their equivalent, for the purpose specified substantially as described.

No. 37,514.—ANDREAS MAYER, of New York, N. Y.—*Improvement in Sugar Moulds.*—Patent dated January 27, 1863.—The improvement, which is fully described in the claim, consists in coating with tin or soft solder all the exposed edges and surfaces that are liable to rust by exposure to moisture.

Claim.—The application of the tin or soft solder to the top and bottom edges of the body of a sugar mould, and to the hoop and upper part of the cast-iron tip, and also to the rivets previous to connecting said parts, and in dipping their joints into molten tin or soft solder after the several parts have been united, substantially as and for the purpose specified.

37,515.—JAMES C. MIX, of Terryville, Litchfield, Conn.—*Improvement in Locks.*—Patent dated January 27, 1863.—This padlock is constructed with a double notch on the shackle, into which projections on two tumblers or pairs of tumblers interlock. These are rotated towards each other by a spring and retained by a dog. The introduction of a key with its double ward through the ward plate, and its rotation between the tumblers, spreads them so as to release the shackle.

Claim.—First, the dog E and spring F, arranged respectively in relation with the tumbler catches C and shackle B, to operate as and for the purpose set forth.

Second, the ward plate G, in combination with the tumbler catches C, for the purpose specified.

No. 37,516.—JAMES F. and EDWIN P. MONROE, of Fitchburg, Mass.—*Improved Apple-Paring Machine.*—Patent dated January 27, 1863.—The turn-table through which the knife shaft projects, and by which it is carried around the apple, is rotated through the medium of a connecting rod by a cam-wheel which is operated by gearing from the hand-shaft. The effect of this connexion is to cause the turn-table to retrace its course after performing its effective stroke.

Claim.—The combination of the turn-table N with the cam wheel F, arranged and operating as described for the purpose specified.

No. 37,517.—CHARLES S. MORRISON, of Keokuk, Lee county, Iowa.—*Improved Steam Steering Apparatus.*—Patent dated January 27, 1863.—The invention is fully described in the claim, and consists of an auxiliary paddle-wheel near the stern propelling wheel, and with its axis at right angles thereto, so as to assist the vessel in obeying the helm.

Claim.—The use of a reserve paddle-wheel acting perpendicularly to the longitudinal axis of a vessel, and having its shaft above the water-line, in combination with ordinary rudders or steerers; ordinary propellers and auxiliary engines acting directly upon the longitudinal shaft, the whole being arranged substantially in the manner and for the purpose set forth.

No. 37,518.—MORITZ PINNER, of New York, N. Y.—*Improvement in Ambulances.*—Patent dated January 27, 1863.—The novelty in this invention consists in the adaptation of a cooking stove and its accessories to a travelling carriage.

Claim.—First, the combination of a cooking stove with the body of a wagon, arranged and operating for use as an ambulance and kitchen, substantially as set forth and described.

Second, The combination of a cooking stove with water tanks and a wagon, arranged for use as an ambulance or locomotive kitchen, either separately or combined, substantially as set forth and described.

Third, an ambulance wagon combining the following features, to wit: an ambulance, a medicine chest, a wagon, compartments for storing provisions, a cooking stove, and a baking oven, the whole arranged and operating substantially as set forth and described.

No. 37,519.—JOHN WYATT REID, of New York, N. Y.—*Improvement in Fortifications*.—Patent dated January 27, 1863.—The invention consists in constructing walls to resist shot, of solid blocks of iron locked together by cavities and projections; and further, in making walls of cast-iron blocks whose weight shall oppose an effective resistance to shot.

Claim.—Locking together solid blocks of metal to form fortification walls by means of corresponding projections and cavities on the opposite sides of the blocks, when the said projections and cavities are formed and arranged in the manner herein shown and described, to avoid injurious weakening of the blocks and prevent their displacement horizontally in any direction.

Also, the application of heavy masses of cast-iron in lieu of stones to form the battery fronts of forts, and to the re-enforcing of existing forts, in the manner substantially as set forth. The application of cast-iron in the form of plates or sheets is not claimed, but only in the form of masses or blocks, and where the purpose is to destroy the effect of the shot by the superior weight of the opposing masses composing the wall or casing.

No. 37,520.—HORACE RESLEY, of Cumberland, Md.—*Improvement in Explosive Shells for Ordnance*.—Patent dated January 27, 1863.—To avoid the explosion of the projectile until it has entered the desired distance into the object fired at, the charge is ignited by a hammer or hammers projecting from the body of the shell, which are pushed in when the piece is being loaded, and are projected by springs so soon as the shell leaves the muzzle of the gun, to be exploded when they come in contact with the object.

Claim.—The arrangement of the means or devices set forth for protecting the operating mechanism, and providing for the discharge when desired.

No. 37,521.—N. A. RHOADS, of Waterbury, Vt.—*Improved Clothes-Wringer*.—Patent dated January 27, 1863.—This improvement is in the sliding jaw or adjustable clamp by which the wringer is fastened to the edge of the wash-tub; it consists of an angle-shaped piece of metal, one arm of which is slotted and ridged so as to bear a set screw and enter a groove on the side of the standard, and the descending arm is fastened by a thumb-screw whose end bears upon a circular socket-piece against the side of the tub.

Claim.—First, the combination of the sliding jaw D and its clamp screw B, with the screw C, or the equivalent thereof, as applied to the said part D, substantially as and for the purpose specified.

Second, the combination of the sliding jaw D and its clamp screw B with the screw E, or the equivalent thereof, as applied to the said part D, substantially as and for the purpose specified.

Third, the combination of the rib *d* and groove *a*, or the mechanical equivalent thereof, with the sliding jaw D, its clamp screw B, and the screw C, as applied to the part D, substantially as and for the purpose specified.

Fourth, the combination of the rib *d* and groove *a*, or the mechanical equivalent thereof, with the sliding jaw D, its clamp screw B, and the screw E, as applied to the part D, substantially as and for the purpose specified.

Fifth, the adjustable bearing or swivel pad, in combination with the sliding jaw and screw, substantially as shown and for the purpose described.

No. 37,522.—FRANCIS B. RICHARDSON, of Boston, Mass.—*Improvement in Elastic Bulb Enema Syringes*.—Patent dated January 27, 1863.—This improvement consists in a more effective compress for the neck of the bulb, in which it is drawn over the annular projection of the plug and firmly clamped by the shoulder and projecting flange of the screw cap.

Claim.—Improvement in a syringe connexion, the same consisting not only in having a bearing neck *e*, extending below the annular projection or shoulder *b*, or its equivalent, made upon the plug A, but in having the bulb neck D embrace the neck *e*, and the annular projection or shoulder *b*, and be compressed on the latter by the screw-cap C, substantially as specified.

No. 37,523.—EDWARD A. L. ROBERTS, of New York, N. Y.—*Improved Vulcanizing Machine*.—Patent dated January 27, 1863.—This vulcanizer consists of a chamber, for containing the requisite water and the goods to be treated, with a tightly fitting top, and a fusible plug to prevent explosion. The chamber is suspended in a furnace which surrounds it, and the heat below is derived from gas or spirit which is allowed to flow in graduated quantity from a reservoir hard by.

Claim.—First, the construction and arrangement of the vulcanizer, substantially as described, whereby the process of vulcanization is carried on and effected in the same vessel or chamber in which the water is contained.

Second, a plug or disk in combination with a vulcanized chamber, substantially as and for the purpose set forth and described.

No. 37,524.—HENRY A. ROE, of Madison, Lake county, Ohio.—*Improvement in Cheese Vats*.—Patent dated January 27, 1863.—The cheese vat is set into and supported by the upper edges of a water vat or tank. Underneath this water tank is a furnace and boiler, and the hot water of the latter communicates by means of pipes with the space around the cheese

vat, so as to place the latter in a hot-water bath. The orifices of the pipes which connect the boiler with the bath are controlled by valves which open downwards, and are operated simultaneously by a rod and bent arms. Inverted troughs, underneath the cheese vat, direct the course of the heated water as it rises from the boiler through the openings and distribute it to the more remote portions of the vat.

Claim.—First, the combination with the heater and vat of a valve or valves, arranged within the heater, and so as to close against the water in the vat or pipe or pipes leading from the heater thereto, substantially as specified.

Second, the employment of two or more valves in connexion with the heater and vat, arranged to control the supply to the vat on opposite sides of it, substantially as set forth.

Third, so arranging the valves which control the supply of hot water to the vat as that they shall close simultaneously, and when closed any pressure in the heater will act to prevent rather than force the circulation, and when released by handle *h*, rod *g*, and elbows *i j*, the valves will open by their own gravity, substantially as specified.

Fourth, the combination with the milk vat *F* and the slats *H H H* of the inverted distributing trough *J J*, substantially as and for the purposes specified.

No. 37,525.—C. G. SHAW, of Florence, Hampshire county, Mass.—*Improvement in Counter Shafts.*—Patent dated January 27, 1863.—The invention consists in fitting a loose pulley upon a countershaft, and connecting them by means of two bevel gear wheels; one of which is fast to the cone pulley, and the other to the shaft, with a third bevel wheel to transmit motion from one to the other. By this arrangement the shaft and the pulley are rotated in opposite directions; and a backward or forward motion of the pulley may be obtained by shifting the driving belt to and from a pulley fast to the shaft, and a pulley fast to the cone.

Claim.—The combination of the loose cone pulley with the shaft *A*, in the manner and for the purpose substantially as specified.

No. 37,526.—ELIAS SHOPBELL, of Ashland, Ohio.—*Improvement in Patterns for Cutting Boots.*—Patent dated January 27, 1863.—Around a central plate are a double series of plates, so arranged as to slide out by the traversing of pins in certain angular slots, and so combined together as to produce equal expansion and contraction of the corresponding parts simultaneously.

Claim.—The plate *A*, in combination with the pairs of plates *B B'*, *C C'* and *D D'*, with their respective slots and angles, producing the simultaneous movement of the several pairs of plates and the consequent unequal enlargement and contraction of the pattern, substantially as set forth.

No. 37,527.—ELIAS SHOPBELL, of Ashland, Ohio.—*Improvement in Pattern for Cutting Shoes and Gaiters.*—Patent dated January 27, 1863.—The patterns are calculated for the vamp and for the quarter. Each of them consists of four pieces so connected together and constrained by slots and pins to certain lines of motion as they are expanded and contracted, that they form a symmetrical shape of larger and smaller dimensions, being clamped at the desired point by a central thumb-screw.

Claim.—The vamp pattern with its articulation *c*, and the several slots governing the simultaneous and proportional extension of the pairs of plates *B B'*, *C C'*, constructed as specified, in combination with the quarter pattern, constructed as described, and having a corresponding and simultaneous proportional extension corresponding to that of the vamp pattern, as herein set forth.

No. 37,528.—M. B. STAFFORD, of New York, N. Y.—*Improvement in Window Sash Fastenings.*—Patent dated January 27, 1863.—By this improvement it is intended to lock two sashes together when closed, so as to prevent them from being opened from the outside. It consists of a pivoted bar attached to a plate on one sash, the said bar having a drop-latch which locks on a curved surface on a plate which is attached to the other sash.

Claim.—The pivoted bar *B*, provided with the notch or recess *c*, and having the bar *C* attached by a joint *d*, in combination with the plate *D*, provided with the ledge *f*, having inclined or curved surfaces *g g*, and the slot *h*, and also provided with the curved ledge *i*, all arranged as and for the purpose set forth.

No. 37,529.—JOHN STRASZER, of St. Louis, Missouri.—*Improvement in Lanterns.*—Patent dated January 27, 1863.—The novelty of this invention consists in the method of securing the upper part of the lantern to the bottom part which contains the oil and burner. The two are connected by a hinge upon which they open, and, when closed, are secured together by a catch.

Claim.—The combination of the hinge and spring-catch, when applied to lanterns, substantially as and for the purpose set forth.

No. 37,530.—BENJAMIN F. TABER, of Buffalo, N. Y.—*Improvement in Machine for Rossing Bark.*—Patent dated January 27, 1863.—In this machine the bark is fed in from the table to the cylinder, with the inner bark toward the cylinder; it is then carried down, by the projections on the latter, to the knife which removes the ross; and afterwards to the beater

where it is broken up into pieces suitable for grinding. The ross escapes under the yielding plate above the knife, which is adjusted to its work by levers clamped by set screws to the frame.

Claim.—First, the combination of the yielding spring pressure-plate C with the feed cylinder B, for the purpose substantially as described.

Second, the arrangement and combination of the rossing knife with the adjustable levers I J K, for the purpose substantially as described.

Third, the combination of the breaker Q, fingers R, and plate O, with the feed cylinder B, for the purposes and substantially as set forth.

Fourth, the combination of the spring flap L, with the pressure-plate C and feed cylinder B, for the purposes and substantially as set forth.

No. 37,531.—DAVID C. TALBOT, of Worcester, Mass.—*Improvement in Callipers.*—Patent dated January 27, 1863.—To one arm of the callipers is a bow or arc graduated in inches and fractions, and to the other an index finger so arranged that the index finger shall be at zero when the callipers are closed, and shall mark upon the vernier the distance between the opened fingers.

Claim.—First, the method of applying a graduated scale or measure attached to callipers or dividers, substantially as described.

Second, the movable hand or indicator B, attached to or moved by the arms of callipers or dividers, substantially as specified.

No. 37,532.—JOHN A. THROP and JOHN COX, of Three Rivers, St. Joseph county, Michigan.—*Improvement in Cultivators.*—Patent dated January 27, 1863.—This cultivator consists of a wheeled frame which is made adjustable as to width, carrying a central frame pivoted to a cross-bar; the cultivator share standards are suspended from the frame by pivots, and drawn by swivelled stay rods. The detail of the construction of the parts will be understood from the claim and illustrations.

Claim.—First, the arrangement of the shovel legs on pivots, in combination with a laterally adjustable frame, or its equivalent, swivelling connecting or stay rods and yielding connexions or wooden pins, substantially in the manner and for the purposes described.

Second, the flexible or jointed frame H, or its equivalent, in combination with the swivelling stay rods *h*, legs I I, cross-bars A' A'' A'', and the cultivator A; all constructed substantially in the manner and for the purpose described.

Third, adapting the cultivator to the double use of "seaming" and "hilling" by the combination of a stiff frame, a jointed, pivoted frame H, and adjustable steps or pins *a a*, substantially as set forth.

Fourth, the jointed frame H, in combination with a rigid frame, when the frame H is pivoted at its front ends and supported by a guide at its rear end, substantially as described.

Fifth, the arrangement of the stay rods *h* and the legs I I, in combination with a frame H, which turns on a different fulcra from those on which the stay rods turn, substantially as set forth.

No. 37,533.—D. H. TUXWORTH, sr., of Baltimore, Md.—*Improvement in Kettles for Culinary Purposes.*—Patent dated January 27, 1863.—This is an arrangement for heating a stove for culinary purposes, by the use of a lamp whose chimney is conducted up through the kettle, thus forming a tube around it for the circulation of water; this circulation being kept up between the parts more remote from the heat, and the tubular portion around the chimney, by a bent tube F.

Claim.—First, the kettle A, provided with the tube D, in combination with the lamp chimney E, the latter being arranged with the tube D, to operate as and for the purpose set forth.

Second, the tube F, when used in connexion with the tube D, and lamp chimney E, and applied to the kettle A and tube D, as and for the purpose herein set forth.

No. 37 534.—E. W. VANDUZEN, of Hamilton Township, Warren county, Ohio.—*Improvement in Water Gauges for Steam Boilers.*—Patent dated January 27, 1863.—The invention consists in the arrangement of the parts of the chamber which encloses the index mechanism, so that the interior may be readily reached for examination or repairs. The index spindle which runs through the chamber is supported at its rear end by a screw which rotates in a removable cap.

Claim.—The combination of the valve *d* and cap D with the dial index spindle *a*, screw *c*, and rod *f*, all in the manner and for the purpose shown and described.

No. 37,535.—W. B. WADSWORTH, of Cleveland, Ohio.—*Improvement in Water Elevators.*—Patent dated January 27, 1863.—The improvements consist in the shape of the wheel, whose teeth enter the openings in the looped links; also in the tilted bar, governed in its motions by the staple-stop on the inside of the curb, which grasps the front edge of the bucket, draws it forward, and tilts the contents into the discharging spout.

Claim.—First, the toothed wheel, as shown and described.

Second, the wheel in combination with the chain *c b b f f d d*, substantially as shown and described.

Third, the tilter *g y*, in combination with the flat chain *c b b f f d d*, substantially as shown and described.

Fourth, the construction and arrangement of the curved tilter *g y* and stops *h h*, substantially as shown and described.

No. 37,536.—D. R. WARFIELD, of Muscatine, Iowa.—*Improvement in Gates*.—Patent dated January 27, 1863.—This gate is pivoted to an angular rail suspended from rollers which traverse a track, and is opened and closed by means of projecting arms or levers on each side, two of which are adapted to raise and open the gate, and the other two to depress and shut it.

Claim.—The employment of the centrally-pivoted double-angle rail B, in combination with the gate A, wheels *a a*, and levers E F, in the manner shown and described.

No. 37,537.—GEORGE WEEDON, now residing in New York, N. Y.—*Improvement in Knife-cleaning Machines*.—Patent dated January 27, 1863. Patented in England November 9, 1857.—This invention consists of a row of sockets into which the ends of the handles are placed; a hold-fast or bar clamping them down by pressure near the shoulder of the blade upon a board where the blades rest to be cleaned by a hand brush. The knives are reversed by raising the hold-fast, lifting a bar, moving it lengthwise, and depressing it again, which rotates the sockets containing the knife handles simultaneously.

Claim.—The combination of reversible holders, scouring board, and hold-fast, substantially as described and substantially for the purpose set forth.

No. 37,538.—SILAS WILSON, of Auburn, N. Y.—*Improvement in Condensing Tubes*.—Patent dated January 27, 1863.—These tubes are made with a curved passage lined with glass.

Claim.—First, constructing the tube with a curved passage substantially as and for the purpose specified.

Second, lining the tube B, with a curved piece of glass tubing A, substantially as described.

No. 37,539.—ALBERT WINTON, of Frederick county, Md.—*Improvement in Water-Wheels*.—Patent dated January 27, 1863.—The improvements relate particularly to the form and arrangement of the buckets of a turbine water-wheel and the surrounding gate, and chutes or inlets; all of which are fully described in the claims.

Claim.—First, the construction of a turbine water-wheel *b b b b e e e e* formed with a close, horizontal diaphragm or partition *c c* and hub *d d*, the buckets or floats *g g g g*, whose outer, vertical edge, longitudinally, is slightly curved, as at *h h h*, said buckets or floats arranged or standing relative to the centre or axis of the wheel at an angle of 14° , and whose lower part is the arc of a quarter-circle, as at *i i i*, and continuing sloping downwardly at an angle of 22° , as at *j j j j*, and likewise inclining outwardly at an angle of about 34° , as at K K K K, figures 1 and 4, so that the inflow of water may be received from and in the direction substantially in the manner as set forth and described.

Second, the cap covering *t t t t t* formed with a circular rabbet or shoulder *u u u u*, and the suspending sleeve or hollow column *v v v v w w w w* with the adjustable step or casing collar *x y z a' a' a'*, combined and arranged substantially as shown in figures 1 and 5, and as set forth.

Third, the mode of suspending the wheel through means of the adjustable collar *b'' b'' b'' b'' c''*, as shown in figures 1 and 5, and as set forth and described.

Fourth, the construction of the peculiar surrounding adjustable gate *f' f' f' f'*, *g'' g'' g'' g''*, formed with the chute guides *h'' h'' h'' h''*, figures 1 and 4, substantially as set forth and described, and in combination with the wheel, as shown in figures 1 and 4.

Fifth, the special arrangement of the vertical chute guides K'' K'' K'' K'' at the angle of 13° , and when so arranged around the circumference of the wheel and buckets thereof as to divide the inflow of the main volume of surrounding water into numerous small columns, one-third greater in number than the number of buckets, and whereby the said columns strike the surface of the buckets nearly or quite at right angles thereto, substantially as in the manner set forth and described.

No. 37,540.—HOMER WRIGHT, of Pittsburg, Pa.—*Improvement in Lamp Burners*.—Patent dated January 27, 1863.—This invention is a contrivance for getting at the wick of a lamp without removing chimney or burner; and consists in bringing the wick-tube so that it may be inclined to an opening or doorway in the side of the burner chamber while it is examined and trimmed. The door is retained shut by catches, and these being retracted are made the handle by which the burner is canted over; the catches being connected to the burner by rods. The shaft of the wick-raiser has a suitable slot for it to travel in as it follows the motion of the wick-tube, to which it is attached, and the burner is held in the open or closed position by a lip.

Claim.—First, arranging the wick-tube B in such a manner that it may be canted or inclined and its upper end brought in or made to project through an opening *h* in the burner, substantially as and for the purpose set forth.

Second, the hinged socket C, in combination with the plate D, door E, and slotted plates *e e*, arranged as shown, and used in connexion with and applied to the wick-tube B to operate or adjust the latter, as and for the purpose specified.

Third, the lip *j* at the lower end of the opening *h* in the burner, in connexion with the slots *k l* in the plate D, for the purpose of retaining the wick-tube B in the two positions described.

No. 37,541.—AMOS H. BOYD, of Medway, Mass., assignor to Himself and JOHN ORVIS, of West Roxbury, Mass., JAMES J. COBB, of Boston, Mass., and JOHN M. STERLING, of Cleveland, Ohio.—*Improved Manufacture of Braid*.—Patent dated January 27, 1863.—The claim in this case is to the new manufacture; the devices by which it is produced are the subject of letters-patent, April 2, 1861, No. 860. The mode of construction is by employing a sewing machine having the usual mechanism for forming a seam, and in connexion therewith certain devices by means of which one or more cords or braids are interwoven with the threads of the sewing.

Claim.—The new manufacture called "Amosine braid," constructed substantially as described.

No. 37,542.—NATHAN COPE, of Cincinnati, Ohio, assignor to EZRA COPE, of the same place.—*Improvement in Giffard's Injector*.—Patent dated January 27, 1863.—In this apparatus the pipe which in the Giffard injector is only used as a waste-pipe is put to another use, except when starting the injector, namely, to carry a secondary supply of water to the point known as the "break" of the injector, where the injection current leaves the aperture and passes to the receiving nozzle. The water coming from the injection nozzle surrounds a jet of steam from which it receives its momentum, and, causing a partial vacuum around it as it issues, takes up a portion of the secondary supply mentioned and carries it to the boiler. The secondary supply-pipe has a three-way cock by which it is made to act as a waste when desired.

Claim.—First, the described arrangement of the secondary water supply to the Giffard injector, as set forth.

Second, the supplying of a portion of the water of a boiler-feeder by a jet of water that has momentum imparted to it by a jet of steam, said water jet acting upon the water of the secondary supply, as described.

Third, the waste-pipe K, in combination with secondary water supply G, which may be opened or closed at pleasure, for the purpose of regulating the action of the injector, substantially as and for the purpose set forth.

No. 37,543.—JEDEDIAH LEAVENS, of Norwich, New London county, Conn., administrator of the estate of WILLIAM R. CROCKER, late of the same place, now deceased.—*Improvement in Machinery for Cutting Corks and Bungs*.—Patent dated January 27, 1863.—In this machine the cork is placed in a rotating wheel in recesses adapted for the rough piece to be operated upon; from this it is carried by a pair of gripping spindles which grasp it by its parallel surfaces and carry it endways to a position where it is rotated, and at the same time has its bevelled surface cut by a revolving wheel. The mandril upon which it moves is adjustable longitudinally and the rotating head carrying the cork blanks is revolved or held in position by ratchets and dogs, or pawls.

Claim.—In combination with a rotating knife, the gripping and rotating apparatus which feeds the corks to the knife, substantially as described.

Also, the feeding wheel L for the purpose of feeding the corks to the gripping spindles, substantially as described.

Also, in combination with the feeding wheel L, the mechanism described, or its equivalent, for turning and holding the feeding wheel.

No. 37,544.—JARVIS DAVIS, of Buffalo, N. Y., assignor to PATRICK SMITH, of the same place.—*Improvement in Breech-loading Fire-arm*.—Patent dated January 27, 1863.—The improvement consists in a spring hook hinged to the under side of the hammer, which in firing enters a recess under the breech, and hooks behind the flange of the cartridge, so as to retract it in the act of cocking the gun. A sliding abutment closes the breech, and is operated by being pivoted to the vibrating guard lever.

Claim.—First, the combination of the spring hook G F with the hammer E, the said spring hook being connected to and operating with the hammer, for the purposes and substantially as described.

Second, the sliding abutment J having a slot *j'* therein, when arranged and used as described.

Third, the recess or chamber *i* made in the breech, for the purpose and substantially as set forth.

No. 37,545.—GEORGE S. FAULKNER, of Stafford, Tolland county, Conn., assignor to O. T. EARLE, of Springfield, Mass.—*Improvement in Steam Valves*.—Patent dated January 27, 1863.—This valve is capable of being moved longitudinally by the direct action of the steam upon it, and depends upon intermediate mechanical devices for the necessary circular motion by which the steam is supplied and exhausted. It consists of a cylindrical chamber or steam-

chest having suitable ports, with a hollow cylindrical valve fitted therein and provided with ports, the said valve being all cast in one piece. The form and construction will be best understood by reference to the drawings.

Claim.—First, the hollow cylindrical valve I, having the several ports arranged and combined and operating substantially in the manner and for the purpose described.

Second, a steam chest constructed with the ports D E P''' and G H, and with a straight cylindric bore, in combination with a hollow cylindric valve with the ports described, and fitted into said chest so that a steam joint, practically, is formed, substantially as set forth.

No. 37,546.—B. J. GOULLIoud, of Paris, France, assignor to SOLOMON and ADOLPH OTTENHEIMER, of New York, N. Y.—*Improvement in Weaving Corsets.*—Patent dated January 27, 1863.—Patented in France July 4, 1863.—This invention is designed to provide for weaving fabrics with gores or gussets, so as to make them fit the person. By the use of the jacquard loom the warps can be so raised and depressed as only to weave at one side, thus forming a gore which, with the ordinary shuttle, would leave a loose thread. This shuttle pays out its thread near one end, and hence when thrown in one direction it unrolls but little, and leaves no loose thread in the warp.

Claim.—A lay and shuttle boxes formed substantially as specified, in combination with a shuttle that delivers its thread at or near one end, and is in length about one-third of the breadth of the lay, whereby the shuttle when thrown in one direction shall cause little or no thread to unroll from the bobbin, for the purposes and as specified.

No. 37,547.—B. J. GOULLIoud, of Paris, France, assignor to SOLOMON and ADOLPH OTTENHEIMER, of New York, N. Y.—*Improvement in Machine for Weaving Corsets.*—Patent dated January 27, 1863.—Patented in France October 6, 1860.—The invention consists in the peculiar construction of a sectional take-up roller, in which the respective sections are connected by sleeves to gearing or pulleys, by which said sections are moved so as to take up the portions of the cloth as woven and keep the edge of the fabric straight with the lay as the gores or gussets are woven.

Claim.—A series of sleeves *a'* surrounding the shaft *a*, and receiving the sections of the take-up rollers and the gears or pulleys for attaching them at the respective ends of said sleeves, as and for the purposes specified.

No. 37,548.—GUSTAVUS A. JASPER, of Charlestown, Mass., assignor to THE UNION SUGAR REFINERY, of the same place.—*Improvement in Purifying and Cleansing Sugar.*—Patent dated January 27, 1863.—The invention consists in introducing into the mass of sugar in revolution fine jets or streams of sirup under pressure, in order to avoid melting of the crystals, and to expedite the passage of the cleansing liquid through the mass.

Claim.—Combining with process of cleansing sugar by centrifugal action in the centrifugal machine, a means or process of forcing the cleansing liquid or sirup in one or more fine jets or streams under high pressure or velocity against the mass of sugar in revolution, the whole being substantially as described.

No. 37,549.—ALEXANDER MAJOR, of Lebanon, Penn., assignor to Himself and WM. M. MAJOR, of the same place.—*Improvement in Grain and Straw Separator.*—Patent dated January 27, 1863.—The shaking shoe upon which the grain and straw are separated is made in two pieces with a longitudinal partition, and by means of a two-throw crank these are alternately raised and depressed, which, in connexion with the notched bars projecting from the floor of the shoe, gives an undulatory movement to the straw, causing the grain to be dislodged.

Claim.—Subjecting the straw to a longitudinal and a lateral undulating motion, along and across a stationary partition, by means of a vibrating apron made in two or more sections, and operated substantially as set forth.

No. 37,550.—JOHN A. PIPO, of New York, N. Y., assignor to Himself and SAMUEL S. SHERWOOD, of Acquackanonck, N. J.—*Improvement in Machine for Making Ruffles.*—Patent dated January 27, 1863.—The object of this invention is to sew a ruffle between two pieces or folds of cloth by a simple seam; it is accomplished by three guides, one for the ruffle and one for each piece of cloth between which the ruffle is sewn, a pawl which forms the ruffling as the work is fed through and sewn by the sewing machine. When the ruffling is secured between the folds of the same cloth a single guide may feed the cloth to the machine.

Claim.—The combination with a sewing machine of the guide 6, the guides 4 and 5, or a double guide in their place, intended to form two folds of a single piece of cloth, and the pawl 7, substantially as described.

No. 37,551.—FRANK P. SLOCUM, of Brooklyn, N. Y., assignor to SAMUEL W. SLOCUM, of same place.—*Improvement in Revolving Fire-arms.*—Patent dated January 27, 1863.—This improvement consists in a method of loading the cylinder in a revolving fire-arm without having the bore extend through to the rear, a portion of the side of each chamber being made movable like a lid, to admit the cartridge sidewise and to allow of the retraction of

the case. These lids are held closed by an encircling ring which slips on the cylinder between stops on the case, which limit its motion, and by the retraction of the ring the lids are freed so as to be removed for loading the chamber.

Claim.—First, the cylinder constructed with lids *b b* to its several chambers, opening in such manner as to permit the cartridges to be introduced, and the discharged cartridge cases to be taken out sideways, and with a closed or solid breech, substantially as specified.

Second, the ring *C* applied in combination with the cylinder and the lids *a a* of the chambers, substantially as and for the purpose specified.

Third, the combination with the ring *C'* of one or more stops *j k* in the frame, substantially as and for the purpose specified.

No. 37,552.—ALPHEUS SOUTHWICK, of Ballardvale, Mass., assignor to the WHIPPLE FILE MANUFACTURING COMPANY, of same place.—*Improvement in Machines for Cutting Files.*—Patent dated January 27, 1863.—Upon a bench is a pivoted platform and standard supporting a sliding frame, which is raised vertically by a feed-screw; upon this frame is pivoted a vibrating block on which the file blank is keyed. A cutter-head is vibrated so as to strike the blank which is held firmly between a back and a face plate. The obliquity of the cut is determined by the rotation of the block in the frame and the force of the blow of the cutter by a wedge-shaped rod which raises with the blank.

Claim.—First, the pivoted or vibrating block *L*, in combination with the sliding frame or box *K*, operating substantially as described.

Second, the swinging frame *F*, with the weighted rod *G*, or its equivalent, for holding the blank up to the face-plate *E*, substantially as set forth.

Third, the standard *C* and platform *D* pivoting on the centre *c*, and made adjustable in the manner substantially as specified.

Fourth, the device for regulating the blow of the cutter *r* as the feed proceeds, viz.: the wedge-shaped rod *P*, which is raised with the blank *b*, and the tapering block or wedge *w* for lowering the top *v*, substantially as set forth.

Fifth, the piece *a''* inserted in the face-plate *E* for the purpose stated, and in the manner substantially as described.

No. 37,553.—SAMUEL B. VANCE, of New York, N. Y.; assignor to MITCHEEL, VANCE & Co., of same place.—*Improvement in Coal Oil Lantern for Railroad Cars, &c.*—Patent dated January 27, 1863.—This lamp is constructed with a perforated conical roof above the burner, and the cone enclosed within a chamber having a draught tube at its upper end, and also an annular opening around its lower edge, for the admission or escape of air; so that whether the draught be upward or downward, the exit may be free and the protected flame be undisturbed.

Claim.—The perforated cone *E*, in combination with the chamber *F* and draught chimney *F'*, applied to the lantern *A*, as and for the purpose set forth.

No. 37,554.—MILTON D. WHIPPLE, of Cambridgeport, Mass., assignor to the WHIPPLE FILE MANUFACTURING COMPANY, of Ballardvale, Mass.—*Improvement in Machines for Cutting Files.*—Patent dated January 27, 1863.—In this machine the file blank is fed upwards by a screw through a central rest-block and jaws or nippers, and all of its faces cut by separate cutters simultaneously. The cutter-heads are mounted on vibrating arms, which are operated by cam-faced wheels simultaneously rotated.

Claim.—The central rest or block *B*, with its jaws or nippers *D D'* for holding the file blank, in combination with the feed mechanism for feeding the blank, and the several cutters *X*, each of which cuts one face of the file during a single feed, substantially as specified.

No. 37,555.—WILLIAM R. BARNARD, of Waterbury, New Haven county, Conn., assignor to Himself and H. G. BLACKMAN, of same place.—*Improvement in the Mode of Uniting Metal Surfaces.*—Patent dated January 27, 1863.—The object of this invention is to unite metallic surfaces by a rivet passing through the outer or thinner body and into a dove-tailed recess or hole in the larger or inner body of metal; so that in the act of riveting, the inner end of the rivet will batter up and spread, filling the hole, and consequently resisting removal. In the case of marine architecture it contemplates an intervening course of wood.

Claim.—The new and improved method of uniting metallic sheets or plates, by means of metallic rivets combined with simple apertures in the outer facing sheets, and interiorly enlarged cavities in the underlying plates of metal, all substantially in the manner and for the purpose herein set forth.

When my invention is used for the purpose of protecting the hulls of iron-plated vessels, I also claim the introduction of wooden strips *y y*, Fig. 4, in combination with the iron strips *x x*, the iron surface *D*, and the riveted metallic facing *B*, in order to obtain a uniform exterior surface, substantially in the manner herein set forth.

No. 37,556.—WILLIAM BREITENSTEIN, of New York, N. Y., assignor to FISCHER & Co., of same place.—*Improvement in Looms for Weaving Corsets.*—Patent dated January 27, 1863.—This improvement consists in appliances and arrangements for weaving corsets or

other irregularly shaped articles or fabrics without interruption, by a Jacquard power-loom with a peculiar divided filling-tightener or thread-catcher, by means of which the adjustments on the cloth cylinder and the formation of the waves in the fabrics are performed regularly and gradually as required.

Claim.—First, the employment in looms of a take-up mechanism which takes up portions of the breadth of the cloth, independently of the other portions of the breadth, in the manner substantially as herein specified.

Second, regulating or determining the action of the several parts of such irregular take-up by the differing force of the impact of the lay on the different parts of the breadth of the cloth, in the manner substantially as herein set forth.

Third, the employment in a loom of a multiple roller substantially as herein described and represented by K K L, for the purpose set forth.

Fourth, imparting a yielding force to the several sections of such roller so as to maintain a constant, or nearly constant, tension on all parts of the breadth of the cloth during the weaving of corsets and the like irregular articles, substantially as specified.

Fifth, the combination of suitable pawls K' with the ratchet wheels K and shaft L, and frictional connexions *n*, or their respective equivalents, for the purpose herein set forth.

Sixth, the employment in looms for weaving corsets and other irregular cloth of the filling stretcher, operating substantially in the manner and for the purpose herein set forth.

Seventh, controlling the operation of the filling stretchers B R, by the movement of the stop W, or its equivalent, substantially as and for the purpose herein set forth.

No. 37,557.—CHARLES W. STAFFORD, of Burlington, Iowa.—*Improvement in Projectiles for Ordnance.*—Patent dated January 27, 1863.—This projectile is formed of a central cylindrical bolt A, with a forward cutting face. Around this is a casing of wood secured by a metallic cap G on its forward end, and a metallic disk C on its rear end, having a projection screwed into the rear end of the central bolt, which is charged and exploded by a cap through a vent hole at the forward end of the charge by the percussive force of the rearward action of the cap C as the bolt pierces the body penetrated. The packing at the rear of the projectile is attached to a boss at the rear of the disk C.

Claim.—First, a sub-calibre shot or shell formed with a cutting face of iron or steel, and surrounded with a cylindrical casing of wood or other light material adapted to the bore of the gun, and formed, applied, and secured in any manner substantially as herein set forth.

Second, the cap C, employed in the manner described, to secure the rear end of the casing B, support, and guide, the rear end of the projectile within the bore, and afford means for the attachment of the packing ring D.

Third, the cap G, employed in the manner described, to secure the forward end of the casing B, support and guide the front of the projectile within the bore, and effect the explosion of the charge by resistance against the surface of a body penetrated by the bolt A.

No. 37,558.—WILLIAM FIELD, of Providence, R. I.—*Improved Ice Creeper.*—Patent dated January 27, 1863.—This improvement consists of a heel plate and a downwardly projecting caulk from the forward part of the boot heel; the whole being held in position by a strap across the instep.

Claim.—In combination with the bar A, ears *a a*, and strap E, or any substantially equivalent means of attachment to the heel of the boot or shoe, the claw C, constructed in the manner described, with a double row of teeth *b b*, to prevent forward, backward, and lateral slipping, and a spur D projecting upward through or above the bar A, and adapted to penetrate the heel, as hereinbefore explained.

No. 37,559.—STEPHEN M. ALLEN, of Boston, Mass.—*Improved Manufacture of Felt.*—Patent dated February 3, 1863.—Under this invention long, vegetable fibres are broken into short lengths by straining them between rollers or other suitable means, which will leave their ends in a stranded or brush-like condition, adapting the fibres to interlace and cohere under the felting process, and also to receive and retain dyes or any other solution it may be desired to apply thereto.

Claim.—Combining ordinary felting materials like fur, wool, &c., with a short fibre made or reduced in such a manner from long staple fibrous materials like flax, hemp, jute, silk, china grass, and similar substances, as to have the peculiarities hereinabove described, whereby, when so combined, they can be felted together by any suitable felting process.

No. 37,560.—DWIGHT BABCOCK, of Seneca Falls, Seneca county, N. Y.—*Improved Bedstead Fastener.*—Patent dated February 3, 1863.—This invention consists in a double pointed coupling hook for securing the rails to the posts, adapted to be used indifferently at either of the four corners of the bedstead.

Claim.—As a new article of manufacture, the coupling hook C, provided with the double points *d d'*, for use on the opposite sides of the bedstead, substantially as described.

No. 37,561.—JOHN M. BATCHELDER, of Cambridge, Middlesex county, Mass.—*Improvement in Bank Notes.*—Patent dated February 3, 1863.—The object of this improvement is to

prevent the successful alteration of the denomination of a bank note by making a series of numbers to extend across the bill, or an embossed space with a series of lines or rays converging on the number, which indicates the value; also by making the number in the series and the denominational figure of the bill of the same color.

Claim.—The fixed scale or column of figures, as 1 2 3 5 10, occupying the whole breadth of the bill, or extending from side to side of a border or embossed space, in combination with a series of lines, marks, or rays radiating from that figure of the scale that represents the denomination or value of the bill.

Also, the combination of a single colored figure of the scale, with the denomination figure of the bill made of the same color, substantially as herein described.

No. 37,562.—ANSON and EBENEZER B. BEECHER, of New Haven, Conn.—*Improved Machine for Making Lucifer Match Splints for Dipping.*—Patent dated February 3, 1863.—The invention consist in the construction and arrangement of a series of devices, by which the match splints are taken one at a time from the hopper by a grooved cylinder, and fed between the folds of a revolving binding tape or band, forming a spiral frame of match splints for dipping.

Claim.—First, the employment of a flexible binding tape or band in combination with a drum adapted to be rotated by a mandrel and removed therefrom, substantially as described, as a means of forming a spiral frame of match splints for dipping, substantially as hereinbefore set forth.

Second, in combination with a frame-drum moved by friction, the endless band and pressure roller, or equivalent feeding mechanism, for the purpose of holding and paying out the flexible binding tape to the frame, substantially as described.

Third, in combination with the frame-drum, binder, setting, and feeding mechanism, the friction drag, or its equivalent, for the purpose of stopping the frame when the feeding and setting mechanism is disconnected from its motive power.

Fourth, the receiving cylinder grooved across its periphery with grooves suitable to take in and hold only a single match splint, each substantially as described.

Fifth, the wire brush, or its equivalent, in combination with the receiving cylinder, substantially as described.

Sixth, in combination with the setting wheels and receiving cylinder, the count wheel, substantially as described.

Seventh, the setting wheels, in combination with the frame-drum and binding tape, substantially as described and substantially for the purpose of setting the splints in the coils of the binding tape, as set forth.

Eighth, in combination with the feeding and setting mechanism, the clutch and system of levers, or their equivalents, whereby the frame is stopped when splints are not supplied at the proper time, and set in action again by the splint itself, substantially as described.

No. 37,563.—GIOVANNI CASELLI, of Florence, Italy.—*Improvement in Telegraphic Apparatus.*—Patent dated February 3, 1863.—This telegraphic apparatus is designed to produce colored letters or characters upon white paper direct by the line current without any local battery or relay, and from original writing in ordinary ink; to transmit despatches of the same size as the originals or reduced, retaining the characters of the original writing; to transmit different messages simultaneously through a single line wire; to reproduce arbitrary characters by electro-chemical action. The machinery for producing these effects, and the manipulations involved, do not admit of a brief description.

Claim.—The combination of the spring *u* and the micrometric screw *V**, with the pendulum of the regulator *P*'', substantially in the manner herein shown and described.

Also, the employment of the marking device, consisting of the oscillating lever *y*, screws *b b'*, slides *d' d'*, styles *v v'*, and tablets *t t*, or their equivalent parts, combined and operating together, substantially as herein shown and described, with the pendulum *A B*, as set forth.

Also, the employment of the copying device, consisting of the segment rack *s*, bar *h i*, levers *h' h'*, styles *v v'* and intermittent drum *A B*, or their equivalent parts, combined and operating together substantially as herein shown and described, and the pendulum *A B*, as set forth.

No. 37,564.—H. CASSIDY, of Putnam, Muskingum county, Ohio.—*Improvement in Corn Planters.*—Patent dated February 3, 1863.—A central beam with handles and a pair of side beams, supported by wheels, and each carrying a furrower and a covering share; before the covering share is a hopper with a reciprocating slide, worked by the wheels, on which the machine runs. This hopper in its spout is divided by longitudinal partitions, so as to drop the grains of corn a little distance apart in the hill.

Claim.—The combination of the chambered hoppers *I*, spring slides *J*, wheels *E*, shares *G H*, and side beams *A*, with each other and with the central beam *C*, all in the manner and for the purpose herein shown and described.

No. 37,565.—J. M. CONNELL, of Newark, Licking county, Ohio.—*Improvement in Explosive Projectiles.*—Patent dated February 3, 1863.—The invention consists in the exterior ar-

rangements for securing the expansion of the packing at the time of explosion. Starting from the centre of the hemispherical rear end of the ball are grooves or flutes, which become shallower as they advance towards the centre of the length of the ball; at about this point there are inclined beads or ribs on the projections between the flutes, cast solid with the shell; an annular packing of lead is placed around this portion of the ball, and the effect of the explosion is to lead the gases underneath the lead packing and drive the lead into the rifling of the piece; the effect of the inclined rib before and the explosion behind being to jam the packing closely and expand it.

Claim.—First, expanding the packing *l* by a combination of the force of the expanding gas and of the resisting action of separated incline planes, substantially as and for the purposes set forth.

Second, the inclined beads or ribs having flutes between them, in combination with a loosely-fitted expansible seat, substantially as and for the purpose set forth.

No. 37,566.—J. M. CONNELL, of Newark, Licking county, Ohio.—*Improvement in Percussion Exploders for Shells.*—Patent dated February 3, 1863.—The invention consists in hanging the plunger upon a rod or stem in the rear of the screw plug, so that the lateral concussion shall produce a leverage impact of one of the percussion caps against the rear of the screw plug.

Claim.—First, suspending a plunger upon a projecting stem *b* of the screw plug A, in the manner and for the purpose set forth.

Second, so applying a shell-exploder to a shell that when the latter strikes obliquely, or sidewise, the said "exploder" shall be ignited by a leverage impact against the rear of the screw-plug, in the manner substantially as described.

No. 37,567.—JOHN H. COOPER, of Philadelphia, Pa.—*Improvement in Door Latches.*—Patent dated February 3, 1863.—The latch consists of a vibrating tumbler, whose axis is vertical, and which has its motion inside of a casing; it is operated by a button or projection on the sliding shank of the door knob to open, and by a spring to close; in the former case it is withdrawn from contact with the catch on the door jamb, and in the latter interlocks therewith.

Claim.—The latch L, in combination with the knobs *k'* and *k''* and shank A, when the latch turns on an axis parallel to that of the door, and when the latch is opened by pushing or pulling the knobs in the manner described.

No. 37,568.—DAVID S. CROSS, of Cincinnati, Ohio.—*Improvement in Car Brakes.*—Patent dated February 3, 1863.—The improvement relates to that class of brakes in which those of a whole train are all operated by the engine and are under the control of the engineer.

A sleeve carrying a clutch and windlass runs freely on the axle of the locomotive, and is slipped along the axle by means of a brake lever and an arm which engages a collar on the sleeve. The mashing of these clutches causes the windlass to revolve and winds up a chain which drags the rubber against the wheels, being fastened to the rubber bar. The chain is prolonged to the next car passing under a roller at the knuckle joint of a descending toggle which, as the cars push forward upon the checking of the locomotive, brings an additional strain upon the brake chain and equalizes the pressure among the adjacent brake rubbers. On the release of the brake lever the sliding clutch is withdrawn and the windlass is released by the raising of the pawl.

Claim.—First, the arrangement of driving axle G, sliding and revolving windlass F, ratchet and pawl H K, clutch I J, armed shaft L M M', and self-releasing attachment N *n* *n'*, in the described combination with the brake chain E, the whole being combined and operating as and for the purposes set forth.

Second, in the described combination with the above the cam-headed lever O connected to the pawl, and operating substantially as set forth.

Third, the provision of toggle P Q and rollers T T' T'', or their equivalents, in the described combination with the consecutive cars, and with the main brake chain E, for the equalization of tension of the said chain, in the manner set forth.

No. 37,569.—AUGUSTUS B. DAVIS, of Philadelphia, Pa.—*Improved Weighing Apparatus.*—Patent dated February 3, 1863.—The object of this invention is to take a series of weights of various amounts, if necessary, without removing each from the platform as it is weighed; as, for instance, in proportioning amounts of material to be used in combination, as ore, coal, and stone, each in a determinate quantity. The supplementary graduated beams are hung below the primary one and are brought into action as needed by their appropriate small levers, the stirrup suspended from the primary graduated beam being provided with knife-edges for their reception.

The required beams having been brought into service, and the weights adjusted to the proper notch, the doors are closed and the proof of the weight of the loads, wheeled on to the platform, can be read by traversing studs which work vertically in slots in the casing of the machine.

Claim.—Firstly, a graduated beam E connected to the platform of a scale, in combination with any desired number of supplementary graduated beams, so arranged that, by the appliances herein described, or any equivalent to the same, any one or all of the said supplementary beams can be connected to or disconnected from the main graduated beam, for the purpose specified.

Secondly, arranging the graduated beam E and its supplementary graduated beams within a box or casing, furnished with doors and locks, substantially as described, and having such openings that, while the attendant can observe the movements of any of the supplementary beams from the outside of the casing, he cannot gain access to the beams themselves or gain a knowledge of the weights determined by the beams.

Thirdly, the stirrup J' suspended from the graduated beam E, and provided with knife-edged bearings k, for the reception of the supplementary beams, substantially as and for the purpose herein set forth.

Fourthly, the levers M, arranged in respect to the supplementary graduated beams and stirrups J', substantially as and for the purpose herein specified.

No. 37,570.—JOHN DERMOND, of Louisville, Ky.—*Improvement in Military Drums.*—Patent dated February 3, 1863.—In this drum a middle hoop is added to the other two and is braced by cords to each. The holes passing through these hoops are parallel to the axis of the cylindrical drum.

Claim.—The hoop B attached centrally to the cylinder A, in combination with the two bracing cords F E and the two bracing hoops E E, all arranged substantially as shown, to form an improved military or side drum.

Further, making or boring the cord holes c in the bracing hoops E E in a direction parallel or nearly so with the axis of the cylinder A and about at the centres of the bracing hoops, as and for the purpose set forth.

No. 37,571.—DANIEL FITZGERALD, of New York, N. Y.—*Improved Sails of Vessels.*—Patent dated February 3, 1863.—These sails are rigged from bowsprits and from other sprits, and are intended to be self-adjustable, so as to expose themselves to the wind blowing in a favorable direction. They favor the parachute, umbrella, and fan, in their form, and in their ability to collapse.

Claim.—First, the self-adjusting sails A, constructed and arranged substantially as above described.

Second, the collapsing jib B, constructed and arranged substantially as above described.

Third, the collapsing circular sail C and D made to fold like a fan, constructed and arranged substantially as above described.

Fourth, the mid-jib, between the two bowsprits, as constructed and described.

Fifth, suspending a circular sail D between the mast and bowsprit or on a jib-hook, constructed and arranged substantially as above described.

No. 37,572.—WILLIAM C. FORD, of Brooklyn, N. Y.—*Improved Paddle-Wheel.*—Patent dated February 3, 1863.—This invention consists in an arrangement of triangular or prismatic buckets in three tiers, so alternating with each other that the water passing two of the tiers is taken by one of the buckets in the intermediate tier, and the water passing on each side of this intermediate bucket is taken by the succeeding two tiers of buckets. The buckets are so placed that their sides stand at an equal angle with the radial line.

An arm-hole with a water-tight valve is provided for each bucket, and flanges or ears by which they may be fastened to the arms or spokes of the wheel.

Claim.—First, the arrangement of the prismatic buckets e f and g, in the manner and for the purposes specified.

Second, the construction of the prismatic sheet metal buckets, with the flanges 3 3 and arm-hole 4, for the purposes and as specified.

No. 37,573.—JOHN JAMES GREENOUGH, of New York, N. Y.—*Paper Bag Machine.*—Patent dated February 3, 1863.—The paper to form the bags is wound upon a roller and fed from that to the cutting cylinder where its sides are cut to the proper shape to form the sides of the bag. Next it is operated upon by the side-creasing roller, while the side-strips or refuse are conveyed out of the machine.

The flap is then folded inward and pressed flat by guides and rollers and conveyed to the gumming disks. At the proper point of its passage a folder strikes the paper and folds it between two rollers, bringing the two gummed surfaces together, and after this the bag is separated from the continuous sheet by a separator plate.

Claim.—First, forming a paper bag or other envelope by cutting the form or blank therefor from a strip or roll by circular knives, as herein described, and then folding the same between a series of rollers without stopping the paper to perform either of the functions, the whole being combined and arranged substantially as and for the purposes set forth.

Second, also cutting the edges of the paper in an irregular line to shape the form or blank by the cylindrical cutters, in combination with folding machinery for making bags, &c., by a continuous operation, as above specified.

Third, also the combination of the "waste" rollers W, or their equivalent, for insuring the separation of the parts, and removing the waste from the machine, with the cutters, substantially as described.

Fourth, also printing or embossing the paper while it is stretched and held tight on both sides of the printing apparatus, while being printed, as herein described, when the same is connected with machinery for making bags and envelopes for the purposes specified.

Fifth, also conveying the form or blank for a bag or envelope through the preliminary operations of forming the envelope, and before severing the same from the strip of paper from which it is cut, substantially as and for the purposes set forth, when the bag is formed by passing the material through a series of rollers, substantially such as is herein set forth.

Sixth, also embossing the line of the seams of bags, or other envelopes, where they are joined by adhesive material, for the purpose of cementing the seams more perfectly, and concealing the joints, as set forth.

Seventh, also turning the side fold of the blank, cut as herein described, before the bottom fold, so as to bring the side fold on the inside of the bag or envelope, and securing the same to the cut lap or side, by which a neater joint is made.

No. 37,574.—JOSEPH FREY, of Battle Creek, Calhoun county, Michigan.—*Improvement in Grubbing Machines*.—Patent dated February 3, 1863.—This invention consists of a powerful lever mounted on an axle and wheels with a cast-iron head, having suitable protuberances for the engagement of the hooks of a clevis, which is fastened round the grub or stump of a sapling.

The cast-iron head is held in its position on the lever by a band and link, and the clevis is provided with a hook on the end for raising grubs by attachment to the roots.

Claim.—The adjustable and movable cast-iron shackle for pulling trees with the roots, in combination with the reversible wrought-iron clevis, or its equivalent, the clevis being guttered; and also the adjustable and movable cast-iron shackle for pulling stool or cap grubs, in combination with the hook on the reversible wrought-iron clevis.

No. 37,575.—BRADLEY W. FRANKLIN, of New York, N. Y.—*Improved Vulcanizing Lamp*.—Patent dated February 3, 1863.—Two or more seamless vessels are fitted to a cover with a steam-tight joint, further secured by bolts which press an angular flanged plate against the rims of the cups and the packed edge of the cover.

Claim.—The construction of a lamp with two or more adjustable compartments, connected with gauze-wire wicks, that shall, when graduated, evolve the proper degree of heat to vulcanize India-rubber and other vulcanizable gums, without the use of thermometers, steam gauges, or other tests, constructed substantially as above described and for the purposes set forth.

No. 37,576.—HENRY A. HANNUM, of Cazenovia, Madison county, N. Y.—*Improvement in Beehives*.—Patent dated February 3, 1863.—This invention consists in an arrangement of a board which forms a ceiling of the main chamber of a hive, and is intended to act as a comb guide and to be removable when necessary. To the two lower opposite edges of the board are dovetailed cleats which support three sided strips or bars from which to suspend the combs.

Claim.—The board or cover B, with the parallel bars *m*, and strips or cleats *n*, arranged and combined as shown, so that the board or cover may be detached from the bars *m*, when necessary, and also used in connexion with them when desired, as herein specified.

No. 37,577.—G. W. HATHAWAY, of Hinsdale, Berkshire county, Mass.—*Improved Shipper Lever for Looms*.—Patent dated February 3, 1863.—The invention consists in the attachment of the foot of the lever which ships the belt to an adjustable fulcrum and applying to it an independent helical spring.

Claim.—The combination with each other and with a loom, of the rigid lever B, the spiral or volute spring D, and the adjustable fulcrum *a*, substantially as and for the purpose herein specified.

No. 37,578.—THOMAS HAWKS, of Rochester, N. Y.—*Improved Extract of Malt, &c., for making Beer, Ale, and Porter*.—Patent dated February 3, 1863.—The decoction of malt and hops is reduced to the consistency of sirup, to which sirup of cane sugar is added, not exceeding one-fourth the quantity of the extract. It is then further reduced, and gelatine added, one part gelatine to twenty parts of the other.

Claim.—A concentrated portable preparation of wort, mixed with and shielded by the sirup of cane sugar, either with or without the addition of gelatine, for increasing its security against the influence of atmospheric changes, substantially as and for the purposes above specified.

No. 37,579.—C. B. HUTCHINSON, of Auburn, N. Y.—*Improvement for Grinding and Pressing Grapes, Apples, &c.*—Patent dated February 3, 1863.—This machine consists of an arched frame on which the operating mechanism is mounted, spanning the curb in which the pomace is pressed. The curb is made of staves with openings between for the issue of cider or wine, as the case may be, and it has a concave follower guided by a rod, and depressed by a screw

passing vertically through the crown of the arched frame. The fruit is ground in a mill attached to a frame. The hopper into which the fruit is thrown, is of a spiral wedge-form, gradually approaching the disk grinding wheel, and also commencing to assume the circular motion of the fruit under treatment. The disk wheel has concentric teeth arranged in spiral groups, and occupying nearly half its face. The toothed cheek in the interstices between which these teeth slide, occupies about a quadrant, and a central part of that is taken up by a depression which communicates with the discharge aperture.

Claim.—The construction and arrangement of a grinding mill and press together, combined and operating substantially as herein specified.

Also, the open discharge depression F, across the face of the case, opposite to the grinding wheel, in combination with said grinding wheel, arranged and operated substantially as and for the purpose herein specified.

Also, in combination with said depression F, the peculiar construction and arrangement of the teeth *h* and *h'*, and spiral wedge-shaped hopper, as herein set forth.

Also, the guide stem N, projecting vertically from the removable follower K, and sliding in a lock *p*, or its equivalent, for the purposes specified.

Also, the combination of the curb I, having openings or slots in the lower portion only, with the concave follower K, and guide stem N, substantially as specified.

No. 37,580.—N. JONES, of La Porte, Ind.—*Improvement in Sewing Machines*.—Patent dated February 3, 1863.—This invention consists in the application to machines having a reversible feed mechanism of a device to meet the difficulty that arises from the fact that when the feed is in one direction the threads are simply interlaced; but when the motion is reversed, the lower thread forms a coil around the needle thread, and the friction between them is consequently so much greater that the tension requires to be increased.

In this machine the same movement that reverses the feed acts upon the tension, and, in sewing back and forth, the tension is adjusted to suit the requirements of the case.

Claim.—So combining the device which produces the tension with the device by the means of which the direction of the feed movement is changed, that by the act of changing the direction of the feed movement the tension is varied in such a manner as is rendered necessary by such change of direction, substantially as herein specified.

No. 37,581.—SAMUEL J. KELLY, of Pemberton, Burlington county, N. J.—*Improvement in Lamps*.—Patent dated February 3, 1863.—The burner has a flat top and is pierced by two flat parallel wick tubes, whose wicks are operated simultaneously by a simple thumb-screw, their shafts being connected by gearing, which revolves out of contact with the tubes.

Claim.—The combination of the doubly-perforated and flat-topped cone or deflector F, the two parallel flat-wick tubes E E', shafts G G', milled head H, disconnected elevating wheels *g g'*, and connected cog wheels *h h'*, the latter having no contact with the wicks, when the said parts are constructed and arranged as herein shown and described and operate in the manner and for the purposes specified.

No. 37,582.—FREDERICK KETTLER, of Milwaukie, Wis.—*Improvement in Motive Power*.—Patent dated February 3, 1863.—The improvement consists in causing a wind wheel to gradually wind up weights by the intervention of gearing, the gravity of which shall be used to drive machinery.

Claim.—The arrangement and combination of a wind wheel with hammers 15, weights 12, and levers and toothed wheels, arranged and constructed as herein described, for the purpose of driving various kinds of machinery.

No. 37,583.—A. H. LANGHOLZ, of Chicago, Ill.—*Improvement in Bridles*.—Patent dated February 3, 1863.—The nose and jaw band of this bridle are made in one piece, and hooked to the upper part of the stiff bit; from thence it passes behind and around in front, through the loop of the check strap, and behind, hooking to the other side of the bit.

Claim.—The combination of the nose and jaw band E with the hook G at each end, when arranged with the head-stall and fastened by the hooks to the top of the bit, as herein described, for the purposes set forth.

No. 37,584.—ALPHONSE LOISEAU, of Berney, France.—*Improvement in Machinery for Coating Thread of one Fibre with another Fibre*.—Patent dated February 3, 1863.—The cotton core to be covered with woollen waste is wound upon mounted bobbins; from these it passes to pressure rollers, which keep it in a state of tension while the woollen or silk fibre, which has been previously carded and formed into a sliver, is wrapped around it by being carried through a flyer, which revolves around the core thread.

Claim.—The arrangement of machinery for coating or covering a core with a thread of wool, or for surrounding a core of any material with a thread of any desired material, hereinbefore described and illustrated in the accompanying drawings.

No. 37,585.—JOHN MADDEN, of Youngstown, Mahoning county, Ohio.—*Improvement in Sewing-machine Needles*.—Patent dated February 3, 1863.—This needle has a groove or channel commencing near the point and running up as far as it enters the work when in use.

with the exception of one spot near the point end of the channel, where the full roundness of the needle is left, and through this the channel is connected by a drilled hole.

Claim.—As a new article of manufacture, the sewing-machine needle, constructed as herein set forth.

No. 37,586.—WILLIAM T. MORROW, of Chicago, Ill.—*Improvement in Journal Boxes.*—Patent dated February 3, 1863.—This adjustable wedge is to be slipped between guides on the face or over flanges on the edges of the driving box of a locomotive, or of the journal box of an axle, so that by its means any wear occurring on the face of the box can be compensated without removing the box.

Claim.—The arrangement of the adjustable liner wedge B, in combination with a journal box A, constructed and applied substantially as and for the purposes set forth.

No. 37,587.—JAMES O'KANE, of Philadelphia, Penn.—*Improvement in Apparatus for Threading Needles.*—Patent dated February 3, 1863.—The apparatus consists of a plate which has a projecting funnel-shaped flange to guide the thread to the hole in the plate, behind which the eye of the needle is placed. The needle is passed through a hole in the recurved end and retained by the lip until its head comes in contact with the notch in a sliding plate, which is adjusted to the size of the needle, in respect to the relative distance of the eye from the end in the different sizes, by means of a graduated cam.

Claim.—First, the cam C so formed, graduated, and arranged in respect to the hole *c* in a plate *a*, to which the cam is hung, that the eyes of the needles of different sizes may, by the aid of the cam and its graduations, be brought to coincide with the said hole in the plate, for the purpose specified.

Second, in combination with the graduated cam, or its equivalent, the slide D with its notch *i*, the whole being arranged and operating substantially as and for the purpose described.

Third, the flexible lip B arranged on the plate *a*, in respect to the hole *c* in the said plate, and the notch *i* in the slide D, substantially as and for the twofold purpose described.

No. 37,588.—JOHN PERCY, of Albany, N. Y.—*Improvement in Water-Meters.*—Patent dated February 3, 1863.—The valves are balanced by being attached to rods on the opposite extremities of a walking beam; they fit into seats on the pistons, which traverse their respective cylinders. The stroke of the piston multiplied into the sectional area of the cylinder is the measure of the amount discharged, and the movement is vibratory, and the action of the valves alternate. The details of construction will be best understood by reference to the claim and illustrations.

Claim.—A balance valve, as constructed, for the purpose described.

Also, the arrangement and combination, substantially in the manner and for the purpose set forth in the above specifications, of the following apparatus, viz: the valve chamber P, with its valves *v* and *v'* and stem T; the chamber D and E, the cylinders F and G, with their pistons H and J connected with the beam L; the valve I and K connected with the beam M; the valve N and O also connected with the beam M; operating valves I and K; the lever U attached to the valve shaft T; the detents 1 and 2, with their pins 6 and 7; lever 3 attached to the shaft of the beam M, with the tripping levers 4 and 5; spring W operated by the beam M, in order to operate the lever *v*; the lever X, as connected with apparatus, measuring the water, forming together a complete water-meter.

No. 37,589.—DAVID U. PRATT, of Cleveland, Ohio.—*Improved Bedstead.*—Patent dated February 3, 1863.—This invention consists in making the side supports for the slats four inches or thereabouts higher at the head than at the foot of the bedstead.

Claim.—Making bedsteads with the side rail and support for the slats four inches, more or less, higher at the head than at the foot, as and for the purpose herein set forth, the same being a new article of manufacture.

No. 37,590.—JULIUS H. PRATT, of New York, N. Y.—*News Distributor.*—Patent dated February 3, 1863.—The inventor is not confined to definite mechanical appliances, but the invention consists in delivering sheets of paper from a balloon into the air by mechanical means.

Claim.—Combining with a balloon mechanism which is capable of throwing off or delivering news sheets into the air during the flight of the balloon, for the purpose set forth.

No. 37,591.—HORATIO REED, of Jersey City, N. J.—*Improvement in the Process of Manufacturing Enamelled Fruit Jars and other Vessels.*—Patent dated February 3, 1863.—This invention consists in applying a coating of melted glass to a red-hot metallic vessel.

Claim.—The lining of a metallic can while in a red-hot state with glass, which is blown in a hot state into a metallic can.

No. 37,592.—FERDINAND SAUTERMEISTER, of Newark, N. J.—*Improved Machine for Spreading Japan, &c., over Fabrics.*—Patent dated February 3, 1863.—The machine consists of a large central drum and surrounding rollers all mounted on a frame. The cloth to be operated upon is fed from the shaft on which it has been rolled, and passing over a roller is

exposed to the "doctor" or distributing bar and three distributing knives; from thence it passes to the central drum, which is driven by gearing and has a roughened surface to give it a hold upon the cloth, and thence passing over suitable guide rollers is conveyed from the machine.

For heavy cloth the face of the central drum is armed with spring bars having sharp projecting points, so as to insure the motion.

Claim.—The use of a drum or cylinder with its surface roughened by sand, gravel, pounded glass, or any like substance, for carrying forward cloths in the process of japanning or painting.

Also, the spring bars G and the roughened rollers L and M, when used in combination with the cylinder,

No. 37,593.—SAMUEL J. SEELY, of Brooklyn, N. Y.—*Improvement in Machines for Corrugating Metals.*—Patent dated February 3, 1863.—This machine corrugates the sheet metal by dies of the form required which press it into troughs or recesses of a corresponding shape.

These dies are so arranged in pairs, that one remains in the corrugation just made, while the other makes another corrugation, which in turn is placed under the retaining die, and so on. The lower die plate or corrugated anvil is fixed to a suitable frame with a table, and the dies are pressed by toggles attached to an adjustable crosshead regulated by screws.

Claim.—First, so operating, retaining and corrugating dies together in a machine for corrugating sheet metal, that the retaining die forms the first corrugation and takes into the corrugations formed successively by the corrugating die, substantially as and for the purpose set forth.

Second, the organization of means, substantially as herein described, for the purpose of corrugating sheet metal, the said organization consisting of the frame A, bed B C, with dogs, the female dies, the male dies with sash beams, the toggle levers, or equivalents, adjustable crosshead, and the gearing or its equivalent, constructed and arranged as set forth.

Third, in a machine for corrugating metal, operating substantially as described, the adjustable crosshead with its hand screws and guide screws, for the purposes set forth.

No. 37,594.—DAVID J. STAGG, of New York, N. Y.—*Improvement in Step Ladder.*—Patent dated February 3, 1863.—This invention consists of a central standard frame with ladders on each side, and so arranged as to serve for a support at all times and admit of their being adjusted in an inclined position for use by an extension on a slotted arm at the upper end, or folded compactly away.

Claim.—The standing or supporting frame A, in combination with the step ladder, either or both of them, connected to the frame A, substantially as shown, to admit of the adjustments herein set forth.

No. 37,595.—ISRAEL STRATTON, of Philadelphia, Penn.—*Improved Cover for Preserving Vessels.*—Patent dated February 3, 1863.—Over the mouth of the jar is laid a circular plate having a flange fitting on the inside of the neck; a ring of rubber intervenes between the plate and the top of the jar, and a screw rod rises from the centre of the plate. A yoke which grips the projecting lip of the bottle is screwed on to the rod and depresses the plate on its elastic bearing and makes a tight joint.

Claim.—The plate B, its annular flange *b*, screwed stem C and ring *e*, of gum-elastic or other suitable material, in combination with the yoke D, and its projections *d*, when the said yoke serves the purpose of a nut, and when the whole is constructed and applied to the mouth A of the vessel, and its flange *a*, as and for the purpose herein set forth.

No. 37,596.—DANIEL TEETER, of Hagerstown, Wayne county, Ind.—*Improvement in Valves for Steam Engines.*—Patent dated February 3, 1863.—In this engine the rotary disk valve is mounted upon a valve seat with four openings in connexion with a double cylinder, whose pistons operate the fly wheel shaft by a two-throw crank. The valve is rotated by a bevel gear connected by a rod and bevel pinion to a bevel wheel on the crank shaft, and the motion is reversed by means of a device, detailed in the third claim, for changing by hand the position of the valve on its seat.

Claim.—First, the rotary valve G, constructed as herein represented and described in combination with the steam ports 1 2 3 4 in the valve seat of the double cylinder D, when said ports are arranged and the rotary valve adapted to operate in connexion with them, in the manner and for the purpose set forth.

Second, the T-headed spindle H, bevelled cog-wheels *c g*, and shaft I, in combination with the loosely-fitted bevelled gear-wheel *j'*, feather *n*, and gear-wheel O, when arranged in the manner and for the purpose specified.

Third, the bevel pinion *j*, fitted loosely on the end of the shaft I, and attached to it by means of a feather or pin *n*, fitting a radial mortise in the hub of the pinion *j*, in the manner described, in combination with the fixed cog-wheel *m*, and toothed segment lever J, adapted for reversing the motion of the engine by changing the relative position of the valve on its seat, substantially as described.

No. 37,597.—WENZEL TOEPFER and HERMAN RUGER, of Milwaukee, Wisconsin.—*Improvement in Blind Fastenings, &c.*—Patent dated February 3, 1863.—This is an arrange-

ment for opening and closing outside window blinds and adjusting the slats from the inside without raising the sash, and consists of a sliding bar with a handle protruding from the window casing, which, by means of a link, is connected with the lower hinge of the shutter. When in position notches on the lower side of the bar catch upon the face plate. The slats are adjusted by a rotating bar passing through the window casing, and by means of a bent arm operating a lever which lifts or depresses the slat rod.

Claim.—First, the sliding bar D, connected with the lower but B of the blind through the medium of the link C.

Second, securing said bar D, or preventing the casual movement of the same, and at the same time locking the blind by means of the notch or recess *j*, pressure rod *k*, and the opening in the face plate F, as herein shown and described.

Third, the rod or shaft G, provided at one end with the arm H, and at the opposite end with the lever I, connected with the slide T, in combination with the pin *q* on the arbor *r* of the knob L, the lip *o* on the slide T, and the lever P and rod O attached to the blind B, all arranged to operate as and for the purpose herein set forth.

- No. 37,598.—J. F. TOZER, of Binghamton, Broome county, N. Y.—*Improvement in Fastenings for Door Latches.*—Patent dated February 3, 1863.—This improvement consists of a fastening to be applied to the knob arbors of locks and latches, to prevent the turning of the knob arbor from the outside. A circular plate, having a segment removed or cut off from it, is attached to the inner side of the collar which is placed on the knob arbor at the inner side of the door. Between the straight edge left by the removal of the segment and a stud or bearing, a wedge is slipped, which prevents the rotation of the spindle when the wedge is in position.

Claim.—The plate H, attached to the inside of the collar E, and having a segment removed or cut off from it, so as to leave a straight edge or surface *b*, in combination with the bearing J, and key or wedge K, all arranged and applied to the door, and in such relation with the knob arbor A, to operate as and for the purpose herein set forth.

No. 37,599.—JAMES WOLSTENHOLME, of Providence, R. I.—*Improvement in Lamp Burner.*—Patent dated February 3, 1863.—The object of this invention is to insure perfect combustion of the heavier kinds of coal oil without the aid of a chimney. It consists of a cap by which the vapor of the oil from the wick-tube is sufficiently confined to keep it at a temperature necessary for complete combustion, and at the same time allow a sufficient amount of air to mingle with it to support the combustion of the hydro-carbon.

Claim.—Surrounding the under side of such flanch with a space of confined air for the purpose of preventing the cooling effect upon the flanch of ascending air currents, substantially as described.

No. 37,600.—H. J. HUNT, of Ottumwa, Wapello county, Iowa, assignor to Self and G. W. DEVIN, of same place.—*Improvement in Lamp Burners.*—Patent dated February 3, 1863.—The cylindrical chamber, which is set upon the lower part, and which in turn supports the chimney, is formed of metal so cut in ornamental fashion as to be elastic, and enabled to grasp the chimney, the cone plate, and the rotating disk or diaphragm of the burner.

The wick-raising pinion is operated by the rotating disk, which has holes engaging with a spoked wheel on the same shaft as the wick raiser, which is supported on ears made by punching a hole through the wick-tube, and through which the raising pinions operate.

Claim.—First, the elastic drum J, constructed substantially as shown, so as to grasp and retain properly in position the chimney L and cone or deflector K, and also admit of being fitted snugly on the disk C and readily detached therefrom, as herein shown and described.

Second, the rotating disk C fitted on the top of the lower part B of the burner, in combination with the stationary rack *c* on the flange *b* of B, and the pinion H on the serrated wheel shaft G, all arranged to operate as and for the purpose herein set forth.

Third, the spring *d*, formed by slitting or cutting the wick tube D as described, and having such a relative position with the serrated wheels F E, to operate for the purpose set forth.

No. 37,601.—JOHN B. MIGNAULT, A. B. SOUTHWICK, and CHARLES SPOFFORD, of Ballardvale, and ALBERT MARSHALL, of Lawrence, Mass., assignors to WILLIAM P. PIERCE, president of the Whipple File Manufacturing Company, and WILLIAM P. PIERCE, assignor to said Company, of Ballardvale, Essex county, Mass.—*Improvement in Machine for Rolling Metals.*—Patent dated February 3, 1863.—The object of this machine is to produce articles of irregular form, such as blanks for files, by rolling, the relative position of the rolls while the articles are passing between them being controlled by patterns. The rolls are attached to shafts in a traversing carriage, which is driven by a pitman and crank. The rolls are rotated by pinions on the upper ends of their shafts, which mesh into permanent racks on the side of their track.

Claim.—The above-described machine for rolling metals, consisting essentially of the rolls *a* and gears H upon the traversing carriage, in combination with the stationary patterns and rack-bars, operating in the manner substantially as set forth for the purpose described.

No. 37,602.—ANTHONY M. SMITH, Jamaica, Queen's county, N. Y., assignor to GILBERT SAYRES, of same place.—*Improvement in Window Sash Fastenings*.—Patent dated February 3, 1863.—The invention consists of a rotating and pivoted hasp, which is attached to one sash and placed over a hook or button on the other sash. The hook is eccentrically pivoted, and in its rotation clamps the sashes firmly together, and retains the hasp by its shoulder, which, by its rotation, has been made to overlie the ring of the hasp.

Claim.—The jointed swivel hasp A, in combination with the swivel hook D and eccentric j, arranged and applied to the sashes to operate as herein set forth.

No. 37,603.—ALPHEUS B. SOUTHWICK, of Ballardvale, Essex county, Mass., assignor to WILLIAM P. PIERCE, president of the Whipple File Manufacturing Company, of Boston, Mass., and WILLIAM P. PIERCE, assignor to said Company.—*Improvement in Grinding File Blanks*.—Patent dated February 3, 1863.—In this machine the file-blank is fastened to a holder and raised vertically, with its face exposed to the grinding wheel; a roller on the back of the holder gives the desired pressure, under the control of the operator by a hand wheel suitably connected with a feed screw and spring. The elevation of the file-blank holder is by means of a chain winding on the periphery of a wheel, which accomplishes a partial rotation and then recedes, being impelled by a pitman from a prime motor connected to a crank on the wheel shaft, which crank moves the wheel by contact with a pin on its disk.

Claim.—The method of connecting the crank I with the wheel G by means of the pin h, whereby the blank may be inserted in the holder without stopping the machine.

Also, the combination of the spring t and screw i with the hand-wheel T and roller R, for the purpose of graduating the force with which the article is pressed up to the stone, as set forth.

No. 37,604.—JOSHUA MELVIN, of Lowell, Mass.—*Improvement in Adhesive Plaster*.—Patent dated February 3, 1863.—The invention consists in placing a layer of caoutchouc between the gelatine and the cloth, or spreading gelatine on caoutchouc, as is fully expressed in the claim.

Claim.—First, in combination with a gelatinous preparation and a backing of cotton or other fabric, the use of a film of caoutchouc or analogous elastic and impervious material interposed between the gelatine and the backing to prevent the former from penetrating the latter, and adapt the plaster to be rolled without injury.

Second, spreading a gelatinous preparation upon a foundation of caoutchouc or analogous elastic and impervious material in the manufacture of adhesive plasters, substantially as set forth.

No. 37,605.—E. BRISSON, of Orleans, France.—*Improvement in Grinding Mills*.—Patent dated February 10, 1863.—This improvement consists in a method of bushing and securing the spindle in its passage through the eye of the lower stone, which is accomplished by surrounding it with a hub and recesses, which hold wooden keys; also, in hanging the stones on universal joints—the upper one on the top of the spindle, and the lower one on the bed plate.

Claim.—First, the mode of bushing or securing the spindle D in the eye K of the lower stone I, to wit, by means of the cylindrical hub C, provided with recesses e in its upper end, and having wooden blocks d and wedges or keys fitted therein, the latter being adjusted by the screws g, so as to press the blocks d against the spindle which passes through the hub C, as set forth.

Second, the hanging or suspending of both stones I M on universal joints, one stone (the runner) being connected with the spindle D by means of the pin l passing through the latter, and having the turning bar P fitted upon it, into or through which bar the spindle passes, and the other stone fitted on the pins a a of the hub C or equivalent bearings, through the medium of the thimble J and swinging socket L, these latter-named parts, with the hub C, being applied, if desired, to the outer surface or exterior of stone I and the parts in the eye K of the stone I, fitted in the eye O of the stone M, substantially as and for the purpose set forth.

No. 37,606.—HARVEY BROWN, of New York, N. Y.—*Improvement in Lamp Burners*.—Patent dated February 10, 1863.—The device for raising the wick consists of an outside thumb-screw on a shaft, with two spur wheels impinging on the wick, and with a spur wheel meshing into a similar one on another shaft, which carries a wheel impinging on the other side of the wick, in a position midway between the two former. The appliances for regulating the draught consist of a perforated band and an interior perforated burner with corresponding openings, by which the air is admitted or excluded by the partial rotation of the inner tube or burner. The device for holding the chimney consists of a pair of springs, between which the foot flange of the chimney is insinuated, and held by the retraction of the pin.

Claim.—First, the arrangement and construction of the spur wheel A', in combination and connexion, by means of the cog wheels D D, or their equivalent, with the spur wheel A, for the purpose of moving the wick, substantially as described.

Second, the band B, in combination with the perforated burner B', substantially in the manner and for the purpose set forth.

Third, the spring C C, constructed, arranged, and operated substantially in the manner and for the purposes set forth.

No. 37,607.—FRANCIS BUSH, of Boston, Mass.—*Improvement in Cartridge-boxes*.—Patent dated February 10, 1863.—This is intended as supplementary to Bush's patent, September 22, 1862, and the improvement consists in making partitions in the outer casing of the cartridge-box which shall not interfere with the motion of the contained sliding boxes which hold the cartridges.

Claim.—Providing the outer metallic box or case with one or more partitions in such a manner that they shall not interfere with the free working of the inner sliding box, for the purpose specified.

No. 37,608.—HORATIO CLARK, of Dedham, Norfolk county, Mass.—*Improvement in Steam-boiler Furnaces*.—Patent dated February 10, 1863.—The grate surface and bridge are made to conform with the shape of the cylindrical boiler, so as to preserve the fire at equal distance from all parts of the exposed surface of the boiler, and this in combination with inclined jambs.

Claim.—The grate constructed in a curved form and arranged concentrically, or about so, with the curved fire surface of the boiler, substantially as described.

A curved grate, in combination with a curved bridge, their upper surface being arranged, substantially as described, with the fire surface of the boiler.

Also, the curved grate and the curved bridge, arranged with their upper surfaces concentric with the fire surface of the boiler, in combination with jambs arranged in the inclined manner with respect to them, substantially as described.

37,609.—JOHN C. CLIME, of Philadelphia, Pa.—*Improvement in Centrifugal Governors*.—Patent dated February 10, 1863.—In this device the upper or suspension rods of the balls are made telescopic, and the lower rods, which are pivoted at their outer ends to the upper rods near the balls, are attached at their lower ends to a sleeve which traverses vertically on the central shaft. As the balls under centrifugal impulse recede from the perpendicular to the point of connexion of two pairs of rods near the governor balls, a spring is attached which spans the intervening space and is attached at its central point to the axes of revolution.

Claim.—The combination of the ball arms, composed of tubes C C and bars D D, or their equivalents, fitted together, as described, the spring G, the rods E E, and slide F, the whole arranged to operate substantially as and for the purpose herein specified.

No. 37,610.—ALANSON CRANE, of Fortress Monroe, Elizabeth City county, Va.—*Improvement in Fire-Extinguishers*.—Patent dated February 10, 1863.—The house having been provided with a series of distributing pipes, with orifices therein, passing through the rooms, and in such a position as to reach all parts, the water is to be let on by means of a key inserted through a hole in the wall, a lock plate having been previously removed.

Claim.—The arrangement of the plug E, to extend through the exterior wall of the building, in combination with the locking cover or plate g, and with the arrangement to diffuse water through the building, as herein shown and described.

No. 37,611.—JOHN CRITCHERSON, of Boston, Mass.—*Improvement in Street-Sweeping Machines*.—Patent dated February 10, 1863.—This machine consists of a frame on wheels, and underneath it is a revolving head set obliquely with the track of the sweeper. The broom stuff is set in oblique depressions on the axis and secured in position by screws.

Claim.—Attaching the fagots or broom material obliquely to the axis, when the same is accomplished by means of and in combination with the depressions running obliquely across the arms R and the concave caps b, secured by screws, which confine the said fagots or broom material, as and for the purpose herein described.

No. 37,612.—GEORGE COLLYER, of Philadelphia, Pa.—*Improvement in Car Couplings*.—Patent dated February 10, 1863.—The coupling rod consists of a flat bar with raised projections on the ends, presenting a triangular face to the detent or coupling pin, which traverses vertically in a chamber in the upper side of the bunter bar. The face of the detent exposed to the projection on the coupling bar is square and slightly bevelled from top to bottom to admit of its easy withdrawal by a direct vertical motion or blow when the cars are jammed together. Its other face is inclined so as to allow the end of the coupling bar to raise it when they come in contact. The flat part of the bar upon which the detent rests, if made wide enough, will, in case of the upsetting of one of the cars connecting, withdraw the coupling bar.

Claim.—First, the combination of the tumbler C, springs D, and grooves a, substantially as described, whereby operators are enabled to uncouple the cars without moving the train backward or forward, no matter how closely the tumbler and the detent of the coupling bar may be pressed together.

Second, the employment of coupling bars such as shown in Fig. 9, having expansions b

near the ends of the bars, which expansions, of themselves, uncouple the cars, in case the latter get off the track.

Third, the employment of coupling bars such as shown in Fig. 10, having expansions *b* near the ends of the bars, with less lateral breadth than the detent, so that although one or more cars of the train may get off the track, the cars shall not be thereby uncoupled.

No. 37,613.—AARON B. COOLEY, of Philadelphia, Pa.—*Improvement in Mode of Obstructing Rivers*.—Patent dated February 10, 1863.—This consists in an anchoring together, and to the shore of rivers or other water-courses, of a number of submerged pyramidal or other angularly-shaped blocks or structures adapted to pierce the sides and bottoms of vessels which may come in contact therewith.

Claim.—Obstructing rivers, harbors, inlets, &c., by a series of angular frames or blocks constructed, chained to each other and anchored, substantially as set forth.

No. 37,614.—E. T. and E. O. DE GEMINI, of Paris, France.—*Improvement in Clarifying Saccharine Juices*.—Patent dated February 10, 1863.—The sirup is treated with animal charcoal and fuller's earth in a vat with a vertical rotating shaft armed with dashers, with arms projecting inwardly from the sides of the vat, or with jets of steam introduced deep into the body of the sirup to agitate it by effervescence, or by both these processes together.

Claim.—The method of clarifying saccharine juices herein shown and described, which consists in subjecting them to the simultaneous action of molecular agitation, under steam, animal charcoal, and fuller's earth, substantially in the manner set forth.

Also, the employment of the apparatus herein shown and described, for the purpose set forth.

No. 37,615.—OREN C. DODGE, of New York, N. Y.—*Improvement in Grain Conveyors*.—Patent dated February 10, 1863.—The belt is made with upturned edges so as to hold grain, and the edges are sustained in their vertical position by strips of metal. When it is desired to discharge the grain at any point short of the end, the belt is carried down and around a lower roller, set a little back so that the grain may be collected by a spout set to catch at the point where it falls from the descending belt.

Claim.—First, delivering the grain at any desired point along the line of a travelling belt, by bending said belt substantially as specified, for the introduction of a hopper or chute.

Second, a travelling belt for conveying grain, provided with vertical, or nearly vertical, edges, forming a trough, substantially as set forth.

Third, the elastic edges 3 3, of the belt *f*, sustained by the metallic stripes 4 4, substantially as specified.

No. 37,616.—G. C. EATON, of Lockport, N. Y.—*Improvement in Grinding Edge Tools*.—Patent dated February 10, 1863.—This is a machine for holding tools while being ground, and bringing them in contact with the grindstone by the depression of a pad operating through a series of levers.

Claim.—The adjusting slot B B', in the part A, the hinged arm E, levers G and I, connecting rod J, stay L, seat K, and slide N, arranged and operated as and for the purpose set forth.

No. 37,617.—GEORGE L. DULANEY, of Mount Jackson, Shenandoah county, Va.—*Improvement in Sewing Machines*.—Patent dated February 10, 1863.—The improvement relates to the construction and operation of the needle bar, the manner of causing the feed motion, the manner of actuating the shuttle, of causing the tension, of taking up the slack thread, and of constructing the shuttle, which is made with a groove or slot on its under side, receiving the bowed adjuster, which confines the shuttle to its place. The machine has two threads operated respectively by a vertical needle and a shuttle moving horizontally in an arc, being propelled by a vibrating arm. The various points of construction and adjustment are fully set forth in the claim.

Claim.—First, the vertically-acting needle arm, composed of one piece of metal, as indicated at *w x y z*, and Figs. 1 and 2, which performs the several different offices and mechanical functions as herein set forth and described.

Second, the special construction of the intermittent acting shuttle carrier device *i2 k2 p2 r2*, Fig. 4, together with the gravitating self-acting shuttle adjusting device *s2 t2 u2*, Fig. 4, as shown and described.

Third, the gravitating self-adjusting feed device *o3 o3 p3 q4*, Fig. 3, constructed and operated in the manner described.

Fourth, the self-acting gravitating pad *v2 v3 w2 w3*, as constructed and combined with the self-acting gravitating feed device *o3 o3 p3 q4*, the lever device *x2 x2*, and the curved bar or tension device *y2 y2*, with the small dependent flexible, fork-like device *z2*, Figs. 1, 2, 3, substantially as set forth, shown, and described.

Fifth, constructing the shuttle *o2 o2* with the bottom slot or depression *o4*, Fig. 4, and the combination therewith of the gravitating, self-acting, shuttle-adjusting device *s2 t2 w2*, Fig. 4, substantially as set forth, shown, and described.

Sixth, the vibrating lever, or slack-thread adjuster *f2 f f2 g2*, Fig. 1, as constructed, ope-

rated, and combined with the needle bar or arm *w x y z*, and Figs. 1 and 2, substantially as set forth and described.

Seventh, the curved bar or tension device *y² y² z²*, Figs. 1, 2, and 3, singly or in combination with the vibrating lever or slack take-up device *f² f² g² h²*, so as to produce the desired effect, in the manner as set forth, shown, and described.

Eighth, the flexible, rotating, radial division device *a³ b³ c³ d³*, Figs. 1 and 2, as constructed, set forth, and described.

No. 37,618.—JOHN FREW, of Meadville, Crawford county, Pa.—*Improvement in Moth Traps*.—Patent dated February 10, 1863.—This trap consists of a box made like a hive and provided with a frame containing old comb to be set among hives, so as to allure the bee-moth to deposit her eggs in it rather than in the hives which are occupied by working bees. It does not differ particularly from an ordinary style of hive, having an alighting board, perch, contracted entrance, and comb frame, in an inner box, with an outer case and lid.

Claim.—A bee-moth trap, consisting of an external case A, cover B, porch C, inner removable close box D, provided with comb frame H, the whole being constructed, combined, and arranged in the manner and for the purpose herein specified.

No. 37,619.—JOHN GERMAN, of Oriskany Falls, Oneida county, N. Y.—*Improved Dowelling Machine for the use of Coopers*.—Patent dated February 10, 1863.—The two arbors in which the bits are secured are attached to sliding heads, and have upon them grooved pulleys; a band passing from a driving pulley rotates all three pulleys. The arbors are adjustable to different distances from each other, and as they are approached the driving pulley is raised in its slotted standard.

A feed table which works on guides carries the wood up to the dowelling bits.

Claim.—First, the three grooved pulleys C F F, having the belt G passing around them, in combination with the slides D D, having horizontal tubes or bearings *n* at their upper ends in which the arbors E of the bits are secured, the whole being arranged and applied to the frame B, as and for the purpose herein set forth.

Second, the feed table H provided with the cleats *t t' t'* and bars *u u*, having inclined upper surfaces, when said feed table is used in combination with the pulleys C F F, belt G, slides D D, and bit arbors E, as and for the purpose specified.

No. 37,620.—JAMES S. GIBBONS, of New York, N. Y.—*Improved Construction of Ships, of-war and other Batteries for Defence against Projectiles*.—Patent dated February 10, 1863.—This consists in a plating covering of alternate iron and wood, the plates of iron being laid on edge, or having their edges exposed to the projectiles, and the intervening space being filled with timber. The successive layers of this plating are laid across each other at suitable angles.

Claim.—The use of wedge-shaped timbers in connexion with iron plates for the purpose of resisting projectiles, substantially as specified; and, in combination therewith, so arranging the plates in one series that they cross those of another, substantially in the manner and for the purposes set forth.

No. 37,621.—JOSEPH GOODRICH, of Muscoda, Grant county, Wis.—*Improved Fishing Lantern*.—Patent dated February 10, 1863.—This lantern has a reflector mounted upon a horizontal shaft so as to be moved by a crank on the outside and brought to bear in a given direction; the crank is elastic, and retained in its place by the pin on its back which engages in holes on the end of the lantern.

Claim.—The arrangement of the adjustable reflector A and the shaft K, when used in connexion with the box or frame of a lantern, and constructed and operating substantially as and for the purpose specified and delineated.

Also, the index spring T T, when used for the purpose of adjusting the reflector A, substantially as set forth.

No. 37,622.—JOHN H. GRAVES, of Rochester, N. Y.—*Improvement in Beehives*.—Patent dated February 10, 1863.—This hive is made double, with openings communicating, which may be closed at will by slides. The floor of this double hive is composed of a perforated plate which extends sufficiently in front, to form an alighting board, and lying on cleats, may be drawn in or out at pleasure. Underneath it is an additional board or bottom, also removable, and upon which gathers the refuse of the hive and the progeny of the bee-moth which seeks the shelter of the chamber formed between the perforated plate and the wooden bottom.

The chambers of the hive are open at bottom and set upon a frame with a centre piece under the contacting sides of the two chambers; in this centre piece is a communicating passage, with a dividing plate to close the passage.

Claim.—The combination of the removable perforated bottom B, covering the entire space of the hive, with the auxiliary bottom D, separately removable and adjustable to or from said bottom B, arranged and operating substantially as and for the purpose herein set forth.

Also, the combination of the cut-off slide H, skeleton frame G, provided with the centre

piece *r*, having the passages *h h* and open-bottomed sections *L L*, arranged substantially as herein set forth.

Also, the perforated alighting platform *C*, in combination with the perforated bottom *B*, substantially in the manner and for the purpose set forth.

No. 37,623.—JACOB HILBORN, of San Francisco, Cal., assignor to HARRISON HAIGHT, of the same place.—*Improvement in Washing Machine*.—Patent dated February 10, 1863.—At one end of the square suds-box is an adjustable concave which is made to contract the washing space, or otherwise, according to the requirements. To this are attached side boards with vertical ribs so as to expose the clothes to a rubbing action as they are driven to and fro by the pendulous dashers.

Claim.—Making the stationary corrugated concave or washboard of a washing machine adjustable, substantially in the manner herein described, so as to adapt the machine to operate on a large or small quantity of clothes.

Also, the combination of the stationary washboard *B*, the vertical reciprocating side wash boards *E*, and pendulum dashers *D*, substantially in the manner and for the purposes herein described.

No. 37,624.—J. G. HOLLOWELL, of Canandaigua, N. Y.—*Improvement in Sewing Machines*.—Patent dated February 10, 1863.—The object of the invention is to construct a machine that shall work equally well both ways—that is, with its wheel and pulley rotating in either direction to admit of the sewing being reversed by changing the motion of the driving wheel. This is accomplished by the construction of the cams which respectively actuate the needle, the shuttle, and the feed. The detail of construction and their relation to each other, as to the sequence of their movements, will be best understood from the drawings.

Claim.—First, so constructing the needle cam *I'* and shuttle cam *L'*, and so combining them with each other and with the rock-shaft for operating the needle and shuttle, that they will operate in proper relation to each other to produce the sewing, in whichever direction the cam shaft *B* or driving wheel or pulley rotates, substantially as herein specified.

Second, the feed cam *J* and presser cam *K*, combined with each other and the presser *H*, to operate upon the latter and produce the feed movement in one direction or the other, according to the direction of the revolution of the main shaft, driving wheel or driving pulley, substantially as herein specified.

No. 37,625.—AMBROSE HYDE, of Lima, Livingston county, N. Y.—*Improvement in Shutter Fastenings*.—Patent dated February 10, 1863.—This invention consists of a hook which projects through and is pivoted to the window casing engaging a plate fastened to the blind or shutter; from the inner end of the bolt depends a hook which rests on a plate, when the catch-bolt is locked to the shutter, and is hooked under the plate, when the catch-bolt is raised, so as to withdraw it from connexion with the shutter.

Claim.—The double-acting detent *K*, in combination with the catch *E* and bar *I*, when so arranged as to either lock the said catch in a rigid position to hold the shutter in place, or to retain it disengaged while the shutter is removed, and operating substantially as herein specified.

No. 37,626.—ROBERT JONES, of Waynesburg, Stark county, Ohio.—*Improvement in Ploughs*.—Patent dated February 10, 1863.—The invention consists in the method of attachment of the beam to the standard, and in the flange at the foot of the standard which affords means of attachment for the mould-board, share, and landside. The rear end of the metallic beam is curved down behind the top end of the standard or sheth which has a corresponding arc-shaped curve. Slot holes in the beam give passage to the bolts by which it is fastened, and secure it at a greater or less elevation, as may be desired, to regulate the depth of cut. A transverse slot in the standard gives means of adjustment from or to the land.

The detail of construction of the flange at the foot of the standard may be gathered from the claim and illustration.

Claim.—The particular combination of the curved inner end *c* of the beam *A*, the curved shoulder *b* of the shank *B*, the bolts *d d'*, the longitudinal slots *e e*, and the transverse slot *f*, when the said parts are constructed and arranged in the manner and for the purposes herein specified.

Also, the particular construction of the flange *g*, with the arm *h* and ears *i* and *i'* permanently attached to a standard *B*, having a curved shoulder *b*, when used in the described combination with the landside *C*, mould-board *D*, and share *E*; all arranged and connected in the manner and for the purposes set forth.

No. 37,627.—ARTHUR J. JUDGE, of Baltimore, Md.—*Improvement in Lubricators*.—Patent dated February 10, 1863.—Above the journal is a chamber or reservoir of oil with a tube and narrow orifice opening upon the journal. The oil exuding upon the journal keeps it lubricated, and the more rapidly as the oil expands by the heat of the journal bearings.

Claim.—First, the construction of a chamber or reservoir to hold the oil with an opening

in the lower part, so small that atmospheric pressure prevents its escape, until expanded by the increased temperature of the journal.

Second, the combination of the three parts, viz: the reservoir or cup, the tube, and the socket, in the manner and for the purposes herein specified.

No. 37,628.—LYMAN KINSLEY, of Cambridgeport, Mass.—*Improvement in Trip Hammers*.—Patent dated February 10, 1863.—The anvil block has a concave base and sets upon a convex plate, upon which it is adjustable, to bring the faces of the anvil and the hammer to a definite angular relation to each other, to suit the taper of the work required, or to adjust in case of wear.

Claim.—The anvil block Q, arranged substantially as shown on a plate R, to admit of the adjustment of the anvil P, as described.

No. 37,629.—EMMONS MANLEY, of Marion, Wayne county, N. Y.—*Improvement in Forming Locks in Tin Plates*.—Patent dated February 10, 1863.—This machine is for bending a plate on a straight line. The plate is introduced vertically against a straight edge which is mounted on one of a pair of jaws. By pressure on a lever the jaws are closed, which bends the metallic plate and pushes it into an interstice between the jaw and a rocking bar, which, under the impulse of the same lever, is made to fold the plate over upon the straight edge.

Claim.—First, providing the folding bar F with a semicircular hub *d*, grooved to receive a semicircular bearing *f*, and all arranged substantially as shown to admit of an open space at one end of the bar F, to allow the plate to be adjusted laterally between it and the jaw D, as herein set forth.

Second, the movable or adjustable jaws C D, arranged in connexion with the lever E, as shown, to operate as and for the purpose specified.

Third, the combination of the folding bar F, jaws C D, and lever E, all arranged for joint operation as and for the purpose herein set forth.

No. 37,630.—JAMES S. MARSH, of Lewisburg, Union county, Penn.—*Improvement in Harvesters*.—Patent dated February 10, 1863.—In this harvester the revolving reel bars and rake are rotated by attachment to a horizontally moving disk or head, and are elevated and depressed by contact with a curved surface against which they slide in their revolution and by their being linked together. The disk wheel, upon which the reel and rake shafts are mounted, revolves upon a shaft attached to the inner bearing of the driving wheel, and the latter is brought into and out of gear with the raking mechanism by a sliding pin which engages the loose bevel pinion operating the disk wheel. The grain gatherer which projects from the inner front corner of the platform is made adjustable towards or from the grain, according to the height and strength of the straw which determines the ability to draw in grain from the side.

Claim.—First, the linking devices described, or their equivalents, applied to the arms of the raking apparatus, substantially as described.

Second, the adaptation of a raking and reeling apparatus combined, which revolves entirely around a vertical centre, for application to the inner side of the draught frame of a harvester at a point below the top of the drive wheel, substantially as and for the purpose set forth.

Third, the use of the inner bearing of the drive wheel as the support of the centre on which the combined rake and reel revolves, substantially as described.

Fourth, the construction of the shaft or centre P of the rake and reel, and the inner segment of the drive wheel in one piece, in the manner described.

Fifth, the combination of the cam R, hinged rake and reel bars and adjustable links, so as to keep the rake and reel bars firmly in control with the grain in the field and on the platform, substantially as set forth.

Sixth, the arrangement of the sliding and turning spring pin *p*, incline *p2*, loose bevel pinion Q, and the raking and reeling apparatus, substantially as described.

Seventh, the adjustable grain guard K, constructed substantially as described, and applied to the inner front corner of the draught frame, for the purpose set forth.

No. 37,631.—JAMES S. MARSH, E. and C. C. SHARKLEY and PETER BEAVER, of Lewisburg, Union county, Penn.—*Improvement in Harvesters*.—Patent dated February 10, 1863.—The invention consists in the proportion and adaptation of the parts to produce a more perfect effect; but it presents no salient feature for description, and can be understood by comparison of the claim and drawings.

Claim.—First, the joint of the pitman and sickle constructed as described, in combination with the guide 10, or its equivalent, for the purpose set forth.

Second, the combination of the grain guide or guard K, and the standards of the reel and the reel, substantially in the manner and for the purpose described.

Third, the combination of the seat base C2, arranged over the drive wheel, with the inner grain guard or guide K, whereby the raker can conveniently reach and rake off the grain at the front inner corner of the platform, as set forth.

Fourth, the arrangement and combination of the hollow bevel wheel *v*, internally toothed

ratchet *x*, and spring *w*, with the pinion shaft *V*, and lever *F*; the whole constructed as described and for the purpose set forth.

Fifth, the combination of the adjustable platform *L M*, bolt *t*, adjusting aperture *t'*, and guide slot *s*, and the adjustable back beam *Q*, arranged on springs, substantially as and for the purpose set forth.

Sixth, the springs *P P*, or their equivalents, applied substantially as described and for the purposes herein set forth.

No. 37,632.—**SYLVESTER MARSH**, of Chicago, Ill.—*Improvement in Apparatus for Drying Grain*.—Patent dated February 10, 1863.—This apparatus consists of a furnace heated with a non-bituminous coal, with an artificial blast or draught over the incandescent fuel passing back through flues, and distributed into apartments in which are upright drying chambers with perforated sides in which the grain is admitted by hoppers at the top, and falling through the upward blast of heated air, is discharged at the bottom.

Claim.—The method herein described of drying grain, malt, hops, and other similar substances, by the employment in combination with an artificial blast of air over an anthracite coal or coke fire, as set forth, of upright drying chambers composed of perforated plate or its equivalent, and when arranged for operation substantially in the manner and for the purposes hereinbefore specified.

No. 37,633.—**RICHARD MONTGOMERY**, of New York, N. Y.—*Improved Defensive Armor for Ships and other Batteries*.—Patent dated February 10, 1863.—This armor is built upon an interior siding which has next succeeding it a number of cylinders or columns of rubber and a casing; outside of this is a layer of deeply corrugated plates which are enclosed by the exterior coating of imbricated plates which are notched and dovetailed into each other for mutual support. The imbricated and corrugated plates are held together by rods which pass through the corrugations and the inner projecting portions of the exterior plates, and the two casings, with their intervening columns of rubber, are bolted together in the ordinary manner.

Claim.—First, the imbricated plates *E*, and corrugated iron *D*, in combination with the columns or cylinders of vulcanized rubber *B*, substantially as described.

Second, fastening together the imbricated plate *E*, and corrugated iron *D*, by means of the rod *F*, as set forth, passing through the corrugations of each plate.

Third, the combination of the imbricated plates *E* with the corrugated iron *D*, constructed and fastened substantially as set forth.

No. 37,634.—**F. A. MORLEY**, of Sodus Point, Wayne county, N. Y.—*Improvement in Cog Wheels*.—Patent dated February 10, 1863.—The periphery of the wheel containing the cogs is insulated from the central portion by a stratum or band of a non-conductor of sounds so as not to impart the vibration of the rim.

Claim.—The insulating of the periphery or parts containing the cogs by means of a stratum of a non-conductor of sounds placed between said periphery and the central parts of the cog wheel, substantially in the manner and for the purpose set forth.

No. 37,635.—**PETER M. NEEFUS**, of New York, N. Y.—*Improvement in Ships' Water Closets*.—Patent dated February 10, 1863.—The object of the invention is to make the joints of water closets more completely air-tight; and this is accomplished by passing the shafts, etc., through stuffing boxes, and facing the valves so as to set more perfectly against their seats.

Claim.—Combining with the shafts, journals, and valves of ships' water closets, substantially as described, stuffing boxes and faced valves, so as to make them air and water tight as herein set forth.

No. 37,636.—**JAMES NORTHRUP, ZACHARIAH LOOMIS and GILES W. CLARK**, all of Homer, Cortland county, N. Y.—*Improvement in Attaching Shafts or Poles to Carriages*.—Patent dated February 10, 1863.—At the rear end of the tongue, pole or shafts, is a cross-head of a cylindrical form, and this sets on a metallic plate with sockets or depressions corresponding to the shape of the head. Single pieces, each adapted to cover one of the arms of the cross and leaving corresponding impressions on their under sides, are then bolted down and the T-shaped head retained, but the shafts, etc., are not restrained from sufficient vertical vibratory movement.

Claim.—The arrangement and combination of the double and single slip bars *c* and *d d*, with the corresponding depressions in each, and when the single bar is made whole and connected with the double clip and with the T-headed thill or pole-iron fitting and working in said depressions as and for the purpose above described.

No. 37,637.—**DUBOIS D. PARMELEE**, of New York, N. Y.—*Improvement in Artificial Limbs*.—Patent dated February 10, 1863.—This improvement consists in attaching the hard rubber socket to the stump by atmospheric pressure; in forming the knee-joint, with an imitation of the natural articulation, by a pair of cylinders rolling on each other and restrained by a locking piece to a double sector-patella, the required elasticity being given by a band connecting the femur and rod which occupies the place of the tibia and fibula; in making

the toe-piece in sections pivoted on a rod and connected above to the instep by a band and clasp, and having beneath an extension which forms the ball of the foot, having elastic bands which are fastened to the hollow of the foot and at the indentation between the toes and the ball of the foot. The prolongation of the instep sets into a recess in the toe-pieces for the latter to rock upon.

Claim.—First, fastening the bucket A of an artificial limb to the stump by means of atmospheric pressure, substantially in the manner specified.

Second, the knee-joint C, constructed of two cylinders *d e*, clasps *f*, double concave sector *g*, and elastic band *h*, all arranged and operating substantially in the manner and for the purpose herein shown and described.

Third, dividing the toe-piece G in two or more distinct parts, substantially as and for the purpose set forth.

Fourth, the arrangement of the stems or tails *m**, projecting from the under side of the toe-pieces *m m' m''*, in combinations with the bands *n*, of leather or other suitable material, and with the elastic bands *o*, adjustable by a metal clasp *p*, or its equivalent, all constructed and operating substantially in the manner and for the purpose described.

No. 37,638.—A. N. PARKHURST, of Peoria, Illinois.—*Improvement in Pumps.*—Patent dated February 10, 1863.—This pump may be said to be in three sections, the upper part of wood, having the handle, delivery spout, and a circular metallic flange partly inserted into the body of the pump which supports the pump by resting upon the platform. The next section is the cylinder, which is of baked clay glazed, and contains the plunger whose rod is extended upwards the length of the upper section; this second or earthenware section is fastened to the upper and to the lower section, which consists of piping by bolts which pass through holes in the flange of the middle section, and are there secured by nuts, barbs, and screws to the wooden sections above and below. The lengths of piping are fastened together by clamps of a horseshoe shape with toe-pieces through which bolts are passed and secured.

Claim.—A pump constructed of wood and baked clay, having a cast-metal flange D attached to it as shown, and the part E, which is formed of the baked clay, attached to the wooden part A, and to the upper section 1, of the piping, by the bolts *i n*, and the different sections of the piping secured together by means of the clamps G, as herein set forth.

No. 37,639.—ISAAC NEWTON PIERCE, of Darby, Delaware county, Penn.—*Improved Composition for Slate Surface, Blackboards, etc.*—Patent dated February 10, 1863.—Composition: benzine, thirty (30) parts; lampblack, three (3) parts; emery, sixty (60) parts; benzine varnish, forty (40) parts; apply as ordinary paint with a brush.

Claim.—The combination of the ingredients and proportions, substantially as set forth, constituting the composition and its application in the manner and for the purpose specified.

No. 37,640.—BENJAMIN M. PIERCE, New Bedford, Mass.—*Improvement in Making Horse-shoe and other Nails.*—Patent dated February 10, 1863.—This invention consists of a rotary cam on a sliding shaft which, under the influence of a treadle, is so advanced as to make the cam engage a series of hammers or dies which are thereby advanced two at a time from opposite sides upon the nail rod, which is introduced into the central space, being held there by gripping jaws which also withdraw the nail. The nail rod is pushed into the centre between the dies until the end reaches the shoulder of the gauge, the treadle is then depressed, which sinks the gauge, makes the grippers clasp the rod, and the cam to engage the dies upon the nail rod.

Claim.—The combination of the rotary cam D, its sliding shaft B, and treadle-lever C, with a series of hammers or dies G G' H H', a nail-discharging mechanism, and a mechanism for severing or cutting the nail from its rod, the whole being substantially as hereinbefore described.

And in combination therewith the gauge L, arranged and operating substantially as specified.

Also, the combination of each pair of the dies with the other pair thereof, by means of the levers K K, constructed and arranged as described, and the spring I, applied to the dies in the manner and so as to cause the dies of either pair of them to recede from one another while those of the other pair may be in the act of approaching one another.

No. 37,641.—GEORGE M. RHOADES, East Hamilton, Madison county, N. Y.—*Improved Device for Closing Mail-bags.*—Patent dated February 10, 1863.—The mouth of the sack or mail-bag has metallic strips riveted to it forming a flange, underneath which U-shaped metallic fastenings may slip so as to hold the mouth shut. These fastenings are made in sections and linked together so as to give elasticity, and a casing of leather fitted over all as a protection against wet and injury.

Claim.—The mode, substantially as described, of constructing a flexible fastening to a mail-bag and for the purposes set forth.

No. 37,642.—ISAIAH ROGERS, of Washington, D. C.—*Improvement in Bridges.*—Patent dated February 10, 1863.—The span of the bridge is supported by arches of tubes which are made in sections longitudinally and bolted together so as to make a wide projecting flange for strength and stiffness. These flanged tubes are connected by metal plates, and the whole

system forms a compound tubular arch with connecting plates. The abutments are supported by inverted arches to resist the upward thrust of the arch.

Claim.—First, the combination of the hollow flanged tubes *A a* and connecting plates *B*, attached together by screw-bolts *C*, or other suitable means for the formation of arches, in manner substantially as herein shown and described.

Second, in combination with a bridge constructed substantially as above described, the inverted arch *L* employed in the manner explained to form an abutment between two adjacent arches.

No. 37,643.—LORENZO D. RUNDELL, of South Westerlo, Albany county, N. Y.—*Improved Pawl for Hay Presses.*—Patent dated February 10, 1863.—This pawl is so made as to be disengaged from the teeth of the ratchet wheel, when desired, by means of making it jointed, the lever being pivoted to the body part and the pawl, bending like a toggle to release it from contact with the tooth of the ratchet.

Claim.—The compound pawl, formed by the lever *g* and body part *d* jointed together at *h*, and acting in the manner and for the purposes specified.

No. 37,644.—PETER SHEARER, of Reading, Penn.—*Improvement in Slide Valves for Steam Engines.*—Patent dated February 10, 1863.—The object of this improvement is to diminish to any desired degree the pressure on the valve in the steam chest, by making it open at top and bringing a cover upon it which shall hold it on its seat with a pressure determinable by the area of the flange of said cover proportionably with the area of the valve opening. The steam is admitted from the cylinder to the steam chest by small valves in the slide valve, when the action of the piston in the cylinder presses the steam upward, but prevent steam from returning from the steam chest to the cylinder as they only open one way.

Claim.—The slide valve *E*, open at the top with the vales *n n'*, or their equivalent, in combination with the cover *F* applied to each other, and operating substantially as herein set forth.

No. 37,645.—R. G. SHURTLEFF, of Springfield, Mass.—*Improvement in Tompions for Fire-arms.*—Patent dated February 10, 1863.—The object is to construct a tompion which may be blown from the muzzle of a gun without bursting or straining the piece, when it may become necessary to remove it in that way, owing to its having become fixed in the muzzle. This tompion has a cylindrical axial slot counterbored so as to make a valve seat for a valve which is retained by a spring backed by a plug. When the powder commences to ignite in the gun the valve is raised from its seat and communication established with the outside by means of a cross bore which intersects the main one.

Claim.—The tompion *A*, with its slits *D* and cylindrical interior *E*, having lateral openings *c*, in combination with the valve *I* and spring *K*.

No. 37,646.—H. S. SMITH, of Brooklyn, N. Y.—*Improvement in Door Bolts.*—Patent dated February 10, 1863.—This invention consists of a notch in the bolt, which, under the influence of a spring, is made to catch in the plate and retain the bolt in its projected position. The bolt is withdrawn by lifting the notch from the plate, and then slipping it.

Claim.—The notch in the bolt *B*, in combination with the spring *E*, fitted on the nob spindle or rod *C*, the above parts being used in connexion with the plate *a' a'' A*, and all arranged to operate as and for the purpose set forth.

No. 37,647.—CHARLES F. SPENCER, of Rochester, N. Y.—*Improved Preserve Jars.*—Patent dated February 10, 1863.—A seat is formed in the neck of the jar, and upon this a lid rests which is formed of a size nearly to fill the narrow aperture below the seat, and with a recess or hollow all round the edge of the lid into which an annular packing ring is inserted which bears firmly upon the seat.

Claim.—The combined arrangement and construction of the double-flanged cover *B*, packing ring *b*, and jar-neck seat *a*, one flange *f* of the cover compressing and tightening the packing ring, and the other flange *g* nearly filling and closing the circle within the seat, substantially as and for the purposes herein specified.

No. 37,648.—SAMUEL C. SUMNER, of Boston, Mass.—*Improvement in Stencil Plates.*—Patent dated February 10, 1863.—A stencil plate is prepared with square holes at the points where letters will be required, that is, with a series of square holes the length of the plate, with narrow intervening strips of plate. The letters are all prepared on separate slips, and the required selection being made, the appropriate letters are introduced through slots in the plate, and up again, so as to expose the letter at the opening through the plate where it and its fellows are securely held while in use, and from which they are readily removed when a new combination is required.

Claim.—The holder *A*, with its holes *C*, slits *d*, and bars *c*, in combination with the letter plates *g*, for the purpose described.

No. 37,649.—NATHANIEL A. TUCKER, of Burlington, Vt.—*Improvement in Car Coupling.*—Patent dated February 10, 1863.—The projecting end of the draught beam of the railroad car has an incline, up which the connecting link slides, and passing down a curve at the rear of the incline, drops into a hole prepared to receive it. A pivoted lever with a curved

face matching the one traversed by the end of the link is now rotated, and filling the concave or curved surface, confines the link. If the lever be dropped when the link approaches, it is lifted by the pressure, and the link finds its attachment; when dropping into the recess it cannot be removed by draught upon it, but only by the rotation of the lever by hand.

Claim.—Confining a coupling link in a recess located below two matching curved surfaces, one of which is stationary, and the other movable, substantially as and for the purposes described.

No. 37,650.—C. VAN HORN, of Springfield, Mass.—*Improvement in Apparatus for Obtaining Profiles of Submarine Beds.*—Patent dated February 10, 1863.—From a frame extends down a tracing rod, and as it is passed over the track its rising and falling is registered or traced so as to delineate an outline or profile of the bottom.

Claim.—The employment or use of a tracing rod G, fitted within a tube E, or an equivalent guide, and arranged with a sliding frame B, slide D, tracing board C, and a framing A, substantially as shown, so that a series of profiles may be obtained of the surface of the bed F of a river or stream for the purpose of constructing a platform of a configuration corresponding to the bed to rest on the same and receive or support the caissons or foundations of piers, bridges, &c.

No. 37,651.—JACOB C. WALTER, of Leonardville, Madison county, N. Y.—*Improvement in Connecting Shafts or Thills to Sleighs.*—Patent dated February 10, 1863.—The thills are attached to a bar which is made adjustable so as to vary their position relatively as to the track, and also place the animal nearer to or more distant from the sleigh. The transverse lower bar slides forward and backward in slots on the fenders or on the bar connecting the runner with the nearest bench or knee, and an upper bar carrying the clips is made adjustable longitudinally on the lower one, and secured by clamps so as to vary the track of the sleigh relatively to the horse.

Claim.—In combination with the mechanism or its equivalent for changing the relative position of the shafts or thills, laterally, the devices or their equivalents for changing or setting the thills forward or back, substantially as described.

No. 37,652.—J. B. WAYNE and WILLIAM EVERED, of Detroit, Michigan.—*Improvement in Rock Drill.*—Patent dated February 10, 1863.—The stem is raised by the cam, which, in rotating, elevates the roller on the sleeve and causes a sleeve to pinch the drill stem; as the cam revolves, the roller reaches the notch into which it falls, and releasing its cross lift on the drill stem, the latter falls, while the sleeve descends in contact with the face of the cam ready for another stroke.

Claim.—The manner of tripping the stem by means of the notched or double cams C, thereby allowing the lever or pincher to drop, while the fulcrum-sleeve is supported, and gradually to descend on the cam, substantially as set forth.

No. 37,653.—WILLIAM WHARTON, Birmingham, England.—*Improvement in Springs for Carriages.*—Patent dated February 10, 1863.—These springs are formed with long depressions on their upper and lower sides into which supplementary springs are placed, being enclosed by the leaves above and below them, and in turn preserving the leaves from lateral displacement.

Claim.—A combination of spring plates secured together or imbedded with each other by the peculiar form or forms of the edges thereof, such plates not being dependent on slots and pins or studs to secure them in position laterally, essentially as hereinbefore described.

No. 37,654.—WILLIAM WHARTON, jr., of Philadelphia, Penn.—*Improvement in Tracks and Switches for Street Railways.*—Patent dated February 10, 1863.—The object of this arrangement is to provide means at the terminus or station of a street railway, whereby the incoming of a car shall set the switch right for the departing car which is on a parallel track, and starts with the incoming of the former, again leaving the switches set for the next incoming car, and dispensing with the use of assistants. The precise detail of the frogs and switches will be readily understood from the illustration.

Claim.—The combination and arrangement, substantially as described, of the tracks A A', B B', switch x, tracks E E' and F F', for the purpose specified.

No. 37,655.—JOHN W. WHEELER and HENRY S. BISHOP, of Cleveland, Ohio.—*Improved Clothes Wringing Machine.*—Patent dated February 10, 1863.—The improvement is in the construction and arrangement of the rollers, which consist of a metallic central shaft with a fluted casing of wood covered by alternate layers of ply and rubber to the size or thickness required. The lower roller has a disk or flange at the end, which serves as a guide to the upper roller.

Claim.—First, covering the body of the roller shaft with fluted wooden cylinders, in combination with the circular flange M, as specified.

Second, the curved levers Q centrally pivoted to the one side of the slot O, the faces of the slot and of the levers being at right angles to a radial line from the centre of the tub, and operating as and for the purpose herein set forth.

Third, extending the flanges M beyond the surface of the rubber, for the purpose of supporting the ends of the rollers, in the manner herein described.

Fourth, the combination of the elastic rollers, consisting of alternate layers of "ply" and rubber, the fluted cylinders and central shaft, when arranged and operating conjointly as and for the purpose herein set forth.

No. 37,656.—JOHN D. WILBER, of Poughkeepsie, N. Y.—*Improvement in Mowing Machines*.—Patent dated February 10, 1863.—In this machine the tongue is located centrally and connected by semicircular hounds with the axle; upon the axle is pivoted the frame to whose front edge the cutter bar is attached; this is likewise supported by chains from the tongue hounds. The points of draught of the single-trees are removed apart beyond the cutting width of the machine. The driving wheels are both geared to the lever which operates the cutter.

Claim.—First, the main frame C, constructed and fitted on the axle A, as shown, in combination with the semicircular bar G, also fitted on the axle A, and having the suspension chains *e e* attached to it at some distance on each side of the draught pole F, so as to bring the said chains as nearly vertical as possible, all as herein set forth.

Second, the combination of the draught pole F attached centrally to the main frame; the cutting apparatus D E, placed centrally in front of and driven by both the wheels B B and a double-tree R, of such length and so placed as to separate the single-trees S S to a distance greater than the length of the cutting apparatus, all as herein shown and described, and for the purpose set forth.

No. 37,657.—GEORGE B. WIGGIN and J. W. HOARD, of Providence, R. I.—*Improvement in Grinding Dies for Nail Machines*.—Patent dated February 10, 1863.—The dies are fixed in the rest at a suitable angle so as to allow for the taper character of the nail, and are then advanced towards two grinding wheels consecutively, one of which has a flat surface and prepares the face of the die, and the other has a narrow rounded face to make the head or hollow on the face of the die, wherein the nail rests as it is gripped while being headed.

Claim.—The combination and arrangement of the two grinding wheels A and B with the movable carriage E, substantially as described, for the purposes specified.

No. 37,658.—HENRY BURT, of Newark, N. J., assignor to Himself, CALEB S. TITSWORTH, and THOS. W. LOWEREE, of the same place.—*Improvement in Water Meters*.—Patent dated February 10, 1863.—This invention consists of a cylindrical chamber, in which a piston traverses, coming in contact with an arm or a vertical rod, and by the impact of one V-shaped edge upon another moving a valve which is long and narrow and traverses sideways, exposing a large opening by very limited motion.

Claim.—First, effecting the movement of the valve by means of two pieces with V-shaped ends and a spring, combined with the piston, to operate substantially as herein described.

Second, combining the valve with the lever G, or its equivalent, on which one of the V-shaped ends is formed, or to which it is attached, and which is subject to the direct action of the piston, by means of a lever E, between which and the said lever G, or its equivalent, lost motion is provided in order to effect the whole movement of the valve very quickly, substantially as herein described.

No. 37,659.—F. B. De KRAVENAN, of France, but residing in New York, N. Y., assignor to JOSEPH H. BAILEY and GEORGE A. JONES, of the same place.—*Improved Mechanical Movement for Lamps*.—Patent dated February 10, 1863.—The object of the invention is, by a mechanical movement, to increase the draught of air to a burner, and avoid the use of a chimney. This is accomplished by the use of a spring and gearing, similar to clock-work, which drives a shaft armed with inclined wings or arms, and located in the roof or flue of the lamp, drawing with some violence a current of air through the lamp.

Claim.—The general arrangement and combination of the mechanism, herein described, and its use and application for the purposes set forth.

No. 37,660.—Suspended.

No. 37,661.—LOUIS D. GERARDIN, of Jersey City, N. J., assignor to Himself and WILLIAM HOWETH, of the same place.—*Improvement in Explosive Projectiles for Ordnance*.—Patent dated February 10, 1863.—The forward conical head and the base plate are fastened together by an axial bolt which clamps firmly together the sets of concentric rings forming the walls of the chamber containing the charge.

Claim.—Having the outer wall of the shell composed of a series of rings placed one upon the other, and clamped together between the head and base plates, substantially as herein shown and described.

No. 37,662.—GEORGE GOEWEY, of Philadelphia, Pa., assignor to Self and WILLIAM BAILEY, of same place.—*Improvement in Corn-shellers*.—Patent dated February 10, 1863.—The corn is passed in at the upper end of the inclined chamber and exposed to a pair of parallel revolving rollers armed with spiral rows of teeth, and to a spring concave, armed in like manner, between which the corn is shelled off, dropping between the rollers; the cob passes on and is discharged at the lower end of the machine.

Claim.—The employment of two rollers B B, both revolving in one direction and having

two or more rows of teeth arranged spirally for the purpose of revolving the ears of corn, said rollers being used in combination with a concave E, having teeth thereon arranged spirally, the teeth on the concave and the teeth on the rollers operating conjointly to shell the corn from the cob and pass the latter out at the tail of the machine.

No. 37,663.—JOHN JOHNSON, of Roxbury, Mass., assignor to Self and HERBERT D. WARD, of Cambridge, Mass.—*Improvement in Packing for Piston and other Rods*.—Patent dated February 10, 1863.—The arc-shaped plates, which, fitted together, form concentric packing rings around the piston rod, are made to occupy a recess in the stuffing-box cover, so that the steam may be admitted behind to make them grasp the piston rod.

Claim.—The arrangement of the packing rings within the gland or stuffing-box cover, substantially as herein described, whereby the gland or cover is made to constitute a box or case to contain the said rings, and in which they can be applied and removed, and provision is made for the admission of the steam or other fluid that is to be confined to act upon the outer peripheries of the rings, substantially as and for the purpose herein specified.

No. 37,664.—MARVIN SWEET, of Sidney, Delaware county, N. Y.—*Improvement in Butter Workers*.—Patent dated February 10, 1863.—This machine consists of a trough to contain the butter and a revolving ladle of an oval section on a shaft transversely above it. The trough is slowly fed along under the ladle by means of a spiral cam on the ladle shaft, which engages the pins on the face of the pinion, operating the rack on the side of the trough.

Claim.—The combination of the slowly-moving trough A with the revolving "ladle" N, formed of a smooth piece of wood or other suitable material, without protuberances, when the said parts are constructed and arranged to operate together in the manner and for the purposes herein specified.

Also, the combination of the screw wheel S, double cog-wheel 8, and rack 7, employed to communicate motion from the revolving "ladle" N to the sliding trough a of a butter-working machine, as set forth.

No. 37,665.—AMOS WESTCOTT, of Syracuse, N. Y.—*Improvement in Device for Preventing Door Keys from being Turned*.—Patent dated February 10, 1863.—The shank of the key is squared, so that a squared recess in a sliding plate attached to the scutcheon of the lock may be slipped down upon it to prevent its being revolved.

Claim.—The combination with the curved, elastic, slotted, sliding plate of the handle k, pin h, and hole h', employed in the manner described, to secure the said sliding plate in the position for locking the key, but admit of its ready movement from within.

No. 37,666.—GEORGE L. WITSELL, of Philadelphia, Pa., assignor to Himself and CLEMENT CRESSON, of same place.—*Improved Washing and Wringing Machine*.—Patent dated February 10, 1863.—The suds-box has two sloping sides and vertical ends having slats; a wedge-shaped dasher, which vibrates upon its edge, is secured in the angular bottom of the box; the sides of the dasher are perforated, and it is manipulated by a handle, being rocked back and forth, bringing a pressure on the clothes between itself and the sides of the box.

A discharge roller is rigged out on a lever from the machine; this carries the clothes as they pass from the wringer and elevates the lower roller against its fellow.

Claim.—First, the vibrating dasher D, composed of the perforated boards d' and angular piece or partition e, or its equivalent, when constructed, combined with, and operating within a reservoir, substantially as and for the purpose described.

Second, the arms H H, connected together by the cross-bar I, arranged on and hung to the reservoir and connected to the sliding boxes i i of the roller G, substantially as and for the purpose herein set forth.

No. 37,667.—THOMAS L. SHAW, of Omaha city, Nebraska Territory.—*Improvement in Balloons*.—Patent dated February 10, 1863.—This balloon has flattened sides to prevent rotary motion, and the car is suspended by netting. It has an apparatus for revolving the balloon independently of the car, and operated by a shaft projecting down within reach of the aeronaut. A gas chamber is carried in the car for charging the balloon, and a steering wheel at the stern of the boat-shaped car. To descend, the gas is pumped out of the balloon and condensed into the gas chamber.

Claim.—A balloon constructed, arranged, and operated substantially in the manner described.

No. 37,668.—JOHN ARMITAGE, of Troy, Rensselaer county, N. Y.—*Improvement in Railroad Chairs*.—Patent dated February 17, 1863.—This invention consists in appliances for securing the rail in its position in such a way that it may be removed when necessary without detaching the chair from the sleeper.

Claim.—The combination of the fixed and hinged jaws B E and screw bolts I I with a base-plate A, arranged substantially as and for the purpose set forth.

No. 37,669.—GEORGE BEDSON, of Manchester, England.—*Improvement in Galvanizing Wire*.—Patent dated February 17, 1863.—The heated wire is drawn directly into the cleaning bath, and thence to the bath of molten metal.

Claim.—Drawing the material in a heated state from the annealing oven directly into the cleaning bath, and thence, when galvanizing is to be done, directly into the bath of molten metal, substantially as herein shown and described.

No. 37,670.—BENJAMIN S. BENSON, of Baltimore, Md.—*Improvement in Moulding and Casting Pipes.*—Patent dated February 17, 1863.—This invention consists in devices for supporting the lower end of the core, preventing the deflection of the central portion of the small cores, and preventing the entrance of sand, metallic oxide, or other foreign matter in the act of pouring.

Claim.—First, the annular flanged base-plate *D d* employed in the described combination with the annular plate *C*, and constituting a seat to guide and hold the lower end of the core, as explained.

Second, the detachable anchor *F f*, constructed and applied substantially as described to prevent the deflection of the intermediate portion of the core.

Third, the shield *G*, employed in the manner explained, to exclude sand, metallic oxide, or other foreign matter, and permit the entrance of the molten metal.

No. 37,671.—SAMUEL W. BIDWELL, of Hartford, Conn.—*Improvement in Sash Fasteners.*—Patent dated February 17, 1863.—The invention consists in a swinging catchpiece, so pivoted as to gravitate towards the sash, and provided with two projections, one in the range of each sash, locking them both in one motion by projecting through perforations in a plate attached to the edge of the sash.

Claim.—The double-pronged, swinging catchpiece *e* in combination with the perforated suspension plate *a*, the whole constructed substantially in the manner hereinbefore described, and operating to lock both sashes of a window, as set forth.

No. 37,672.—S. C. BRINSER, of Middleton, Pa.—*Improvement in Horse Rakes.*—Patent dated February 17, 1863.—In this invention the forward draught of the team is used to elevate and clear the teeth at the proper instant, the weight of the driver holding them down at other times. A slight motion of the lever brings either of these forces into controlling action.

Claim.—The combination of the treadle *K*, levers *J H*, and connecting rod *I*, constructed and arranged as specified, with a horse rake in which the draught is applied to the thills or bed, and the latter hinged to the rear and upper part of the axle, all as herein shown and described and for the purposes set forth.

No. 37,673.—THEODORE W. BURGER, of Jersey City, N. J.—*Improvement in Boiler Feeders.*—Patent dated February 17, 1863.—This feeder consists in an arrangement of three chambers, one always full, communicating with another which is termed the measuring chamber, and a third communicating with the second, which has communication with the boiler; the first and second are united by a hollow slide-valve which, as it descends, opens communication between the measuring chamber and boiler, and by ascending severs that connexion, but again fills the measuring chamber. The valve rod is connected with the engine in any suitable way.

Claim.—The arrangement of the chambers *d c e*, valve *B*, and ports *h i*, substantially as and for the purpose herein specified.

No. 37,674.—BENJAMIN CLOUGH, of Natick, Middlesex county, Mass.—*Improvement in Machines for Shelling and Winnowing Corn.*—Patent dated February 17, 1863.—The corn is fed in between the revolving toothed cylinder and the elastic toothed concave, where the corn is shelled and passed down through a riddle into the inclined floor, whence it passes out of the machine, a blast from a fan driving away light impurities. The cobs are carried up to the cob eduction passage and are removed. Stray grains, which may have been carried up with them, are allowed to fall through the second riddle in the floor of the cob-eduction passage.

Claim.—Improved arrangement of the two grids *D E*, and the cob and kernel eduction passages *F I*, with the chute *H*, the elastic concave *C*, the stripper *B*, and fan blower *K*, the whole being arranged as shown in the drawings and as above described.

No. 37,675.—JOHN WEBSTER COCHRAN, of New York, N. Y.—*Improvement in Percussion Fuze for Explosive Shells.*—Patent dated February 17, 1863.—At the forward part of the shell is the ordinary cylindrical cavity communicating with the interior; this is occupied by a hollow piston whose forward end is shaped so as to form a nipple for a percussion cap; from the rear of this piston extends a contractile chamber in shape like a frustum of a cone, and behind this again is a heavier conical mass, which is deeply imbedded in the powder with which the shell is charged. In the act of firing this cone is torn off, the concussion brings the cap on the end of the piston against the plug, and the fire communicates through the hollow piston with the explosive material with which the shell is charged.

Claim.—First, the hollow, tapering, and contractible material *G*, arranged to operate in connexion with the striker of a percussion shell, substantially in the manner and so as to secure the advantages herein set forth.

Second, the loaded cap or mass *G*, arranged to operate in connexion with the striker *D*, and tapering, contractible material *F*, in the manner set forth.

No. 37,676.—L. O. COLVIN, of Philadelphia Pa.—*Improvement in Cow Milker*.—Patent dated February 17, 1863.—The pan is extended at the end of a rod which is fastened by a ring and strap to the body of the operator; inside of the pan is a cup or piston with a flexible margin attached to the upper edge of the pan, and this piston is elevated or depressed by a lever attached to the aforesaid rod; communicating with the space between the piston and the pan are elastic tubes, strengthened by a coil of spring wire, into which are inserted the teats of the cow, and the lever depressed; the teat tubes are attached to the pan by hooks which slip over a flange on legs projecting from the pan.

Claim.—First, the pan or receptacle A provided with the arm F having the straps G H attached to it, in combination with the India-rubber or other suitable flexible cover or piston C, lever E, and teat tubes I, all arranged to operate substantially as and for the purpose herein set forth.

Second, providing the teat tubes I each with a spiral wire I', as and for the purpose herein specified.

Third, the attaching of the teat tubes I to the horizontal tubes H' of the pan or receptacle A by means of hooks *i i* attached to rings J on the lower ends of the teat tubes, and which hooks are fitted over the edges of plate *g*, secured to the part *f* of the tubes H', as herein set forth.

No. 37,677.—L. O. COLVIN, of Philadelphia, Pa.—*Improvement in Breast Pumps*.—Patent dated February 17, 1863.—The improvement consists in the attachment to the ends of hinged rods, like shears of a pan and a piston, attached by a flexible margin to the edge of the pan; the space between them communicates with the interior of the nipple tube, and the action of the pump draws upon the contents of the breast, which, by the next motion, is discharged into the receptacle below by the opening of the valve in the bottom of the pan.

Claim.—The cup A provided with the valve B in its bottom, in combination with the piston I, constructed of India-rubber or other flexible material, nipple tube E, and milk receptacle C, with the handle F, and lever G, or their equivalents, all arranged substantially as and for the purpose specified.

No. 37,678.—L. D. COWLES, of Armada, Macomb county, Mich.—*Improved Clasps for Harness Tugs*.—Patent dated February 17, 1863.—In this clasp, which is intended as a substitute for the tug buckle, the two ends of the tug are clamped between plates, the movable one being fastened to the other by means of lever plates having eccentric slots, and working in journals attached to the latter; these lever plates fold inwards and over each other.

Claim.—The two plates A F, in combination with the lever plates E E, provided with the eccentrics *c c*, and connected to the plate F through the medium of the screws C and rods D, all arranged substantially as and for the purpose herein set forth.

No. 37,679.—RUEL DEAN, of Boston, Mass.—*Improvement in Railroad Track-Clearers*.—Patent dated February 17, 1863.—Beneath the frame of the car is suspended by chains a plough and a pair of scrapers, one for each track. A spring gives the required pressure and a lever is so arranged as to lift the contrivance clear of obstructions when necessary.

Claim.—The suspended plough A, with its scrapers *d*, in combination with the spring H and lever F, or its equivalent, constructed and operating in the manner substantially as set forth.

No. 37,680.—JOHN M. DE BOLLE, of Philadelphia, Pa.—*Improvement in Valves for Hose Nozzles*.—Patent dated February 17, 1863.—This is an interior valve which is raised on a vibrating arm by a lever on the outside which communicates through the valve-box with the interior. The valve is of a conical or bevelled form, with a flange shod with rubber to fit the valve-seat, and is kept closed by a spring which actuates the exterior operating lever.

Claim.—The application to hose pipes of the valve disk A, the same consisting of the conical or bevelled edge C, the flange F, and the thin gum-elastic ring E, constructed and arranged in relation to each other as set forth, and operated together by means of the carrier G on the lever D, as and for the purpose specified.

No. 37,681.—DANIEL DE GARMO, of Rochester, N. Y.—*Improved Self-locking Safety Hook for Tow-Lines*.—Patent dated February 17, 1863.—The swing hook to which the tow-line is attached is retained, when down, by a bolt which is projected by a spring till it catches on the hook. The spring bolt is retracted by a lever when the swing hook may be raised and the tow-line withdrawn.

Claim.—The combination of the spring bolt D with the lever C and the swing hook B, substantially as and for the purpose specified.

No. 37,682.—WILLIAM E. DOUBLEDAY, of Brooklyn, N. Y.—*Improvement in Forming Bell-crown Hats*.—Patent dated February 17, 1863.—This invention consists in a method of forming bell-crowned hats, bloomers, &c., by a contractile band employed to give the bell shape after the hat has been pressed by dies with a straight-sided crown.

Claim.—The method herein specified of forming bell-crowned hats, bloomers, &c., by an

elastic band applied around the crown to draw the same to the die or block, after the general shape has been given to the hat or bloomer between dies, as specified.

No. 37,683.—GEORGE ELBRIG, of Cincinnati, Ohio.—*Improvement in Chimney Top*.—Patent dated February 17, 1863.—The sides of the chimney top are provided with lateral openings and doors acting under the impulse of wind from the inside, and the interior of the chimney top has plates or projections, which serve to deflect a downward current of air towards the lateral openings provided for its egress.

Claim.—The combination of the self-acting doors *A'* with the openings *b* and plates *a*, in the manner and for the purpose herein shown and described.

No. 37,684.—JAMES M. EVELETH and GEORGE C. MOORE, of Oroville, Butte county, Cal.—*Improvement in Sliding Hinges*.—Patent dated February 17, 1863.—The plate of this hinge which is attached to the post has raised flanges, within which is a sliding plate carrying the pintle to which the other member of the hinge and the gate are attached. This sliding plate is moved back and forth by a thumb-screw, which adjusts it to any shrinkage or sagging that may have occurred.

Claim.—A sliding hinge, the use and purpose of which is to overcome the disadvantage arising from the shrinking and swelling of gates and doors, as herein described.

No. 37,685.—R. B. FITTS, of Philadelphia, Pa.—*Improvement in Preparing Night-Soil for Manure*.—Patent dated February 17, 1863.—The process consists in deodorizing and arresting fermentation, in suitable vats, for the more ready separation of the aqueous parts. The nitrogenous particles of the aqueous solution are then precipitated and absorbed by chemicals, evaporated and returned to the more solid portions, and the whole rendered pulverulent by sifting and mixing with anhydrous sulphate of lime, charcoal, ashes, or other absorbent.

Claim.—The improved method or process described, for producing desiccated night-soil for agricultural purposes.

No. 37,686.—CHARLES GOLDTHWAIT, of South Weymouth, Mass.—*Improved Clothes-Drying Apparatus*.—Patent dated February 17, 1863.—This consists of a supplemental frame of any shape suspended from a clothes-line by hooks or hangers.

Claim.—The employment or use of the hangers or supplemental clothes-frames *C*, provided with hooks *d*, and constructed in such a manner that the clothes may be secured upon them, and the hangers or frames suspended on the line *A*, as herein set forth.

No. 37,687.—ALEXANDER GORDON, of Rochester, N. Y.—*Improvement in Straw Cutters*.—Patent dated February 17, 1863.—The straw is fed to the revolving cutter by an endless belt whose links are armed with teeth and whose driving drum is rotated by a pinion pivoted to the end of a toggle formed of two links, at whose intersection is a spring which keeps the drum elevated against the upper pressure roller; the feeding drum being thus hung upon the toggle, its elevation and depression are in an arc of a circle, and its pinion is constantly in gear with the wheel from whence it derives its motion.

Claim.—First, the employment in cutting boxes of the feeder belt *B*, when constructed, arranged, and operating in the manner specified.

Second, the yoke *F* and straps *g*, as specified, for the purpose of keeping the pinions *p* and *p'* in the same relative position as the latter moves up or down.

No. 37,688.—ELANDER HEATH, of San Francisco, Cal.—*Improved Amalgamating Machine*.—Patent dated February 17, 1863.—This machine consists of a cylinder which rotates upon an axis diagonal with the true cylindrical axis, and is formed with a corrugated interior surface, the corrugations running parallel with the true axis and across the end; it is also provided with annular ribs, which project from the inside of the cylinder in a plane parallel to the heads and at right angles to the axis of the cylinder. The effect of the obliquity of the axis of rotation is to make the contents slide and roll as the machine is rotated. A lid admits to the interior, and the latter is also entered by a pipe.

Claim.—The employment of a cylinder constructed internally with corrugations and ribs arranged and described, and rotating upon its diagonal axis.

No. 37,689.—R. HEINISCH, of Newark, N. J.—*Improvement in Shears*.—Patent dated February 17, 1863.—The invention consists in the shape of the blades, so as to bring the cutting edge to the desired and specified line and relation to the axis of vibration, as is specifically detailed in the claim.

Claim.—First, the shears, the upper blade of which is formed out of line with the shank, as described, being so bent that the cutting edge shall fall nearly or quite in line with the rivet or clamp-screw and cross the shank in a diagonal line in its direction; and so that when the shears are closed the back of the upper blade shall present a hip-like elevation coincident with such recession of the blade, all as shown and described.

Second, in combination therewith, the extension wedges as shown and described.

No. 37,690.—ALBERT N. HENDERSON, of Buffalo, N. Y.—*Improvement in Lamp*.—Patent dated February 17, 1863.—Around the wick tube is a larger tube, leaving an intervening space which is open at the top and connects with the interior of the body of the lamp by small holes.

Claim.—The combination of the said larger tube around the said wick tube so as to afford the said space, without air holes, between them, in connexion with the said small holes connecting said space with the interior of the body of the lamp, in the manner and for the purposes set forth.

No. 37,691.—SAMUEL SHERMAN HICKOK, of Marlborough, Monmouth county, N. J.—*Improvement in Potato Diggers*.—Patent dated February 17, 1863.—This potato plough consists of a wide share and point, which, running under the hill, raises it and allows it to pass back to a shaking grate, which is kept in motion by connecting links and levers engaging with the cam teeth on the shaft of a grooved roller which precedes the share. An arched bar from the standard to the share raises the vines or weeds so as not to clog the operation of the grating which is separating the potatoes from the soil.

Claim.—First, the vibrating prongs *l l*, fitted as specified, in combination with the mould-boards *h* and nose *i*, for the purposes and as set forth.

Second, the bar *k*, curved forward and downward as shown, and extending in front of the mould-boards to insure the raising of the weeds and vines sufficiently to prevent their clogging, as set forth.

Third, the arrangement of the compound levers *o* and *r* and links *m* and *q*, in combination with the wheel *e* and cams *t t*, for giving motion to the vibrating prongs, as set forth.

No. 37,692.—BENNET HOTCHKISS, of New Haven, Conn.—*Improvement in Drop Presses*.—Patent dated February 17, 1863.—The drop is raised by its strap, which is pinched between two rotating pulleys, one of which is eccentric and is held firmly against the strap by pressure upon a lever and retained there by a latch, the release of the lever allowing the drop to fall. The drop may be caused to fall at any prescribed height by stops which rise with the weight and lift the bar to which the inner end of the lever is pivoted, and trip the catch which retained the lever down and held the eccentric pulley fast against the lifting strap.

Claim.—First, the eccentric pulley *F*, in combination with the pulley *E*, when the same operate in the manner and for the purpose substantially as herein set forth.

Second, the eccentric pulley *F* and drop *A*, when the same are combined substantially for the purpose as herein specified.

Third, the lever *L* and latch *f*, when the same are combined in the manner described with the eccentric pulley *F*, for the purpose specified.

Fourth, the combination of the lever *L* and latch *f* with a drop, substantially as herein described.

Fifth, the rod *M*, with its adjustable stops *h* and *i*, in combination with the lever *L* and latch *f*, substantially in the manner and for the purpose herein set forth.

Sixth, the adjustable trip in combination with a drop, substantially as and for the purpose specified.

No. 37,693.—JOHN C. HOWE, of Worcester, Mass.—*Improvement in Revolving Fire-arm*.—Patent dated February 17, 1863.—From the rear of the barrel projects a spring latch, which serves to retain the chamber on the central pin when the barrel is disconnected from the upper part, and to lock upon the upper part of the frame when the barrel is returned to its normal position, being assisted in maintaining its place by the hammer. The axis pin is firmly attached to that part of the stock which vibrates with the barrel, and when the latter is disconnected it may be used to draw charge or remove obstructions from the chambers. A detachable recoil plate, with a spring in its rear, is situated behind the chamber, and through a slot in this plate the pawl works, rotating the chambers under the impulse of the hammer.

Claim.—First, the spring latch *E*, constructed and applied to serve the two purposes of connecting and locking the barrel to the upper part of the frame and of securing the cylinder on the axis pin when the barrel is disconnected from the upper part of the frame, substantially as herein described.

Second, so constructing the rear end of the spring latch and the head or nose of the hammer that when the hammer is down it aids in securing the spring latch in connexion with the frame, substantially as herein specified.

Third, so constructing an axis pin and applying the same, in combination with the barrel or frame, that while remaining attached to the barrel or frame it may be used to expel from the chambers of the cylinder the cartridge cases or shells or any other matter which may remain therein after firing, substantially as herein described.

Fourth, though I do not claim a movable recoil plate, I claim the combination of the detachable recoil plate *D* and the spring *t*, inserted in the front of the frame and secured by a screw *t'*, covered by the said recoil plate, substantially as and for the purpose herein described.

No. 37,694.—SETH C. HOWES, of South Chatham, Barnstable county, Mass.—*Improvement in Bench Planes*.—Patent dated February 17, 1863.—The construction of this plane

will be readily perceived from the illustration. It consists of a method of setting up the plane-bit by means of a screw, it being retained in the desired position by the rotation of another screw which, by the impingement of its end on the top of the plane-bit, presses the cap against the upper plate of the box in which the bit works.

Claim.—The rod *F*, having the screw *d* cut upon it, and provided with the nut *E*, with spurs *b* on its outer surface to fit in holes in the plane-iron *C*, in combination with the cap *D*, provided with the screw *K*, and trunnions *e e*, the latter being fitted in adjustable bearings *ff*, which are placed in slotted plates *J J*, and retained therein at the desired point by the serrated edges of the bearings, and the slots or any equivalent means, all arranged substantially as set forth.

No. 37,695.—R. H. JEWETT, of Mount Sterling, Brown county, Ill.—*Improved Defensive Armor for Ships and other Batteries.*—Patent dated February 17, 1863.—Over the wooden sides of the vessel, and confined thereto by bolts, are an outer and inner plate of iron, and the space between these is occupied by a network of iron cells, or corrugated plates, with their edges exposed to and in contact with the outer and inner plating, each space thus formed being independent.

Claim.—Having the filling plates *C* made in corrugated form, united at the angles *a*, and placed endwise and clamped between the plates *A B*, as herein shown and described, so that independent air-chambers *h* will be formed by said plates, while the plates *C* will resist all exterior pressure on their ends, like pillars, thus securing great strength and buoyancy, all as set forth.

No. 37,696.—FREDERICK C. KRAUSE, of New York, N. Y.—*Improved Composition for Porous Stone, for Filtering and other Purposes.*—Patent dated February 17, 1863.—Composed of sand, 4 to 6 pounds; marble dust, 3 to 6 ounces; silicate of soda, or potash, 1 pound. Made plastic with water, and baked in a kiln.

Claim.—The employment or use of a composition for porous stone made of the ingredients herein specified, and mixed together in about the proportion and substantially in the manner described.

No. 37,697.—CAROLINE LEARNED, of Columbus, Ohio.—*Improved Nitrated Mercurial Ointment.*—Patent dated February 17, 1863.—One ounce quicksilver; nitric acid, two ounces; when dissolved add one pound of lard, two drachms of pulverized alkanet root, one drachm of beeswax, previously mixed. When these ingredients are compounded, add one ounce of oil of sassafras.

Claim.—The herein-described vermin ointment, composed of the ingredients named, and compounded in the manner specified.

No. 37,698.—JACOB LUTHER, of Walnut Fork, Jones county, Iowa.—*Improvement in Water Wheels.*—Patent dated February 17, 1863.—This improvement consists in the form of the buckets which are intended to receive the percussive force of the water and then to allow it, deflected by its impingement, to escape in a contrary direction, bearing with some continued pressure upon the recurved surface of the tail ends of the buckets, the water being introduced in a gradually narrowing space.

Claim.—The buckets *G*, constructed as described, so as to have at the face sides three different surfaces *h i j*, and attached to the verge or periphery of the head or body *e* of the wheel, in combination with the case *C*, formed of two parts *a a*, arranged or disposed relatively with the wheel, as shown, so as to form two water induction passages *b b*, and two curved taper water passages *c c*, substantially as and for the purpose herein set forth.

No. 37,699.—DAVID LYMAN, of Middlefield, Conn.—*Improved Clothes Wringing Machine.*—Patent dated February 17, 1863.—The improvement consists in the construction of the springs which are imposed upon the journal boxes of the upper roller to give the requisite pressure for wringing the clothes. Two tapering pieces are used, bringing their bulging surfaces together so that they may rock on each other, the ends of the lower piece resting upon the said journal boxes and those of the upper one being depressed by thumb-screws in the upper bar of the frame.

Claim.—The within-described arrangement of the tapering and freely-rocking springs *M N*, relatively to the bearing boxes *C C*, and screws *D D*, or their equivalents, for the purpose herein set forth.

No. 37,700.—JOHN TRACY MYGATT, of Binghamton, Broome county, N. Y.—*Improvement in Locks.*—Patent dated February 17, 1863.—The invention consists in placing a collar with an oblique face on the arbor, by the rotation of which the stud which engages with the bolt of the lock shall be withdrawn so that the rotation of the handle shall not affect the bolt.

Claim.—The collar *H*, placed loosely on the arbor *E*, and provided with an oblique end *d*, in combination with the oblique end *c* of the shank *b* of the knob *F*, pin or catch *e*, the spring *J*, and cap *I*, all arranged with the arbor *E*, to operate as and for the purpose set forth.

No. 37,701.—AMOS NUDD, of Waupun, Fond du Lac county, Wis.—*Improvement in Lateral Waste Valves for Pumps*.—Patent dated February 17, 1863.—An orifice is made in the stock, and a gate or valve sliding in a socket opens or closes the aperture by motion from a rod, which rises to a height above ground to be conveniently grasped.

Claim.—The combination and arrangement of the rod, sliding gate and socket with the stock of the pump, when operating in the manner and for the purposes substantially as set forth.

No. 37,702.—OLIVER PEARL, of Lawrence, Mass.—*Improvement in Flyers of Spinning Machines*.—Patent dated February 17, 1863.—The invention consists in making the sides or arms of the flyer of flattened wire so as to present the edge to the air and attaching them to the nose or upper bearing by brazing or otherwise.

Claim.—The combination of the nose or upper bearing of the flyer, with the sides or arms made of flattened wire and brazed or attached to the nose, so as to be nearly in a tangent to the bobbin, and present the thin edge of the arm to the air when revolving.

No. 37,703.—CHARLES E. PHILLIPS, of Abington, Plymouth county, Mass.—*Improvement in Heading Tool for Screws*.—Patent dated February 17, 1863.—This tool consists of two jaws, between which is a plate projecting into a circular or disk-shaped recess the size of the head of the screw desired. This being driven upon the head gives it the shape and the slot.

Claim.—The arrangement of the adjustable and removable blade D, in combination with the jaws B C, constructed and operating substantially as herein described and for the purpose specified.

No. 37,704.—HENRY E. PLUMB, of Monroe, Fairfield county, Conn.—*Improved Elevator and Carrier*.—Patent dated February 17, 1863.—The rope by which the bucket is elevated passes over a carriage which runs on ways, and as the bucket reaches a certain height, a button on the well rope strikes a flap-board, disengaging the hook which retains the carriage. The latter, under the continued tension of the rope, is then drawn along on the ways until a frame comes in contact with the bucket and upsets it. This frame is placed in such a place and position as to discharge the contents where required, and on the loosening of the rope the counterpoise weight draws the carriage back again to the point above the well, and the bucket is again lowered.

Claim.—First, the combination of the carriage C, ways B B, counterpoise weights F F, and rope M, all arranged substantially as shown for the purpose specified.

Second, the hook K and the flap J, in connexion with the button or knob N on the rope M, arranged substantially as shown, for liberating the carriage C at any desired elevation of the bucket, as set forth.

Third, the brake G, when used in combination with the counterpoise weights F F, drum E, and carriage C, as and for the purpose specified.

Fourth, the adjustable frame O, when used in combination with the carriage C, ways B B, and bucket L, or other receptacle or load holder, for the purpose of discharging the elevated load at the desired spot, as described.

No. 37,705.—JOHN G. PUSEY, of New York, N. Y.—*Improvement in Machinery for Carving and Drilling Gun Stocks*.—Patent dated February 17, 1863.—The machine consists of a reversible holder, which carries the pattern and the gun stock so that its upper and lower sides can be presented at the various angles necessary for all the required slots and holes in accordance with the pattern in the same holder. The various patterns of cutters required in the operations of carving and drilling are all arranged radially on a head, having their stocks with the respective driving pulleys converging near the centre of the disk, and a central pulley and band shifter, by which the band is shifted to act on the stock immediately required, and when required. Each of these drills is accompanied by a tracer, which is intended to be the same length as the drill or reamer, and the required tool having been brought to bear by the rotation of the head on which the drills, &c., are arranged, the tool under the guidance of the reamer by the manipulation of the rest makes the required orifice or slot in the gun stock.

Claim.—First, arranging a series of tool stocks to radiate from a common centre in combination with a series of tracers, substantially as specified, whereby all the tools and tracers may move together in mortising, boring, or carving, but the tools not in use will, by their divergence, be out of the way, as set forth.

Second, the arrangement of the pulley *m* in the middle of the circular head *k*, and of the fork *p*, or its equivalent, for receiving and changing the belt *d'* in the manner set forth.

Third, the parallel bars *e e' e'*, fitted and arranged substantially as specified, in combination with the circular head *k*, for the purposes and as specified.

Fourth, the frame *u* on centres 10 at right angles, or nearly so, to its length, and receiving the pattern and gun stock, or other article, substantially as specified, whereby the pattern and article to be acted upon can be reversed to present either side to the tool and tracer, as set forth.

Fifth, a holder fitted on centres and carrying the pattern and gun stock, and arranged substantially as specified to swing on said centres while the tool is inletting or cutting the curved parts of the stock, in order that the said tool may act at right angles to the surface, for the purposes and as specified.

No. 37,706.—ANDREW RANKIN, of Philadelphia, Pa.—*Improved Annunciator*.—Patent dated February 17, 1863.—This annunciator is so arranged that the lifting of any wire shall not alone expose the number of the apartment, but shall lift a plate, and through the connecting wire cause the hammer to strike upon the bell. The slides, with the numbers upon their faces, have projections on their rear with holes through which the wires pass, and the upward movement of the slides is limited by transverse bars above them, which cross the line of their motion.

Claim.—First, the uses of a plate D, or its equivalent, connected to the alarm bell of an annunciator, and so arranged in respect to the wires connected to the slides B that the movement of each wire, as it operates its slide, will impart such a movement to the plate D as will sound the bell.

Second, the slides, with their projections *b*, when arranged in respect to the plate A, substantially as set forth, for direct connexion to the wires.

Third, the frame H, with its cross-pieces *f f*, in combination with the projections *b* of the slides B, the whole being arranged and operating substantially as and for the purpose set forth.

No. 37,707.—WILLIAMS F. RUNDELL, of East Genoa, N. Y.—*Improvement in Lifting Jacks*.—Patent dated February 17, 1863.—This machine consists of a standard on a foot-piece, the former having notches on its edge in which a pin may rest; a lever vibrates on the pin, and is retained at the requisite depression by a rack bar, into which a feather edge on the lever engages.

Claim.—First, having the fulcrum pin *a* fitted loosely in a hole in the lever *c*, and secured against casual longitudinal movement therein by means of a set screw *n*, when arranged in the manner and for the purpose specified.

Second, the rigidly attached rack bar *e*, standard *d*, and toothed racks *g g*, in combination with the loosely-fitted fulcrum pin *a*, lever *c*, and feathered edge plate *m*, when the whole is arranged to operate in the manner and for the purpose specified.

No. 37,708.—SAMUEL T. SANFORD, of Fall River, Mass.—*Improved Machine for Stringing Dried Apples and other Fruits*.—Patent dated February 17, 1863.—In a box rotates a sectional hopper in which the pieces of apple are dropped. They are in turn brought against the edge of a knife, whose bent end is presented, having a line hanging from its back or lower edge; the knife passes through openings in the divisions of the hopper, and forcing the apple against the knife and on to the twine, leaves it to be pushed down by hand.

Claim.—First, a knife D, constructed or bent in the form substantially as shown, in combination with a string F, the latter being attached to the former, and both arranged to operate as and for the purpose set forth.

Second, in combination with the knife D and string F, the revolving hopper B and box A, all constructed and arranged for joint operation, as and for the purpose specified.

No. 37,709.—JOHN D. SMEDLEY, of Chicago, Ill.—*Improvement in Oil Stills*.—Patent dated February 17, 1863.—From the lower part of the still a small pipe connects with a larger one placed vertically against the wall of the building. The latter pipe descends below the level of the floor of the still for the collection of water, which may be run off by a faucet, and is open at top. A float on the surface of the oil in the vertical pipe rises and falls with the varying height of oil, and by means of a cord, pulleys, and weight, the depth of oil in the still is indicated on an index.

Claim.—The use of the large pipe A, in combination with a small horizontal connecting tube B, in any way substantially as described, by means of which the fluid in the pipe being kept constantly cool and free from agitation from the still, the quantity of liquid in the still is always correctly indicated.

Also, the extension of the pipe A below the bottom of the still, forming a chamber *a*, by means of which the water is separated from the oil, and can be drawn off.

No. 37,710.—ADDISON SMITH, of Perrysburg, Wood county, Ohio.—*Improved Steering Apparatus*.—Patent dated February 17, 1863.—Over the keel of the vessel is a main pipe, which has branches right and left at each end of the vessel, by the violent driving of water through which the vessel may be turned around.

Claim.—The combination of a main pipe with branches *c c c c*, branching at right angles with the keel, for the purpose only of turning a vessel on the centre or moving it sidewise, as herein described.

No. 37,711.—DAVID M. SMYTH, of New York, N. Y.—*Improvement in Apparatus for Clasping Hoops to Ladies' Skirts*.—Patent dated February 17, 1863.—The clasps are placed pro-

miscuously in a hopper doubly inclined and provided with a side flange and successive slots, so as by a series of movements to arrest the progress of the clasps that have not assumed the required position, and compel them, before they are delivered, to turn the stems downward, which is the proper presentation. The carrier which feeds the hoop along consists of a forked slide, and is retracted when the clasp is fixed to free it from the hoop, and then under the influence of the rocking lever through a series of devices is caused to vibrate and bring the hoop forward, so that the next place to be clasped may be directly under the point of impingement of the hammer.

Claim.—First, the double inclination of the surface of the feeder, in combination with the side flanch and the three successive longitudinal slots for permitting the escape or discharge of such of the clasps as are not in the required position, and for holding back such as happen to be in the required position, with the stems upward, and for gradually turning them over that they may be delivered one by one with the stems downward, substantially as described.

Second, the carrier, with its up-and-down movements to liberate a hoop which has been clasped, and take the next and move it to the required place to be clasped, substantially as described, in combination with the anvil and the hammer, or their equivalents, as and for the purpose substantially as described.

No. 37,712.—J. H. THOMAS and P. P. MAST, of Springfield, Ohio.—*Improvement in Seed-ing Machines.*—Patent dated February 17, 1863.—The machine is so arranged that the lifting of the share from the ground also closes the seed-slide by the rotation of the cam moving the slide bar in the guide and operating the cut-off.

Claim.—The arrangement of the guide *m*, in connexion with the drag bars *a a*, the drill-teeth *c c*, the chains *d d*, and the hinged bar *D*, provided with the cam *e*, used with the seed slide *n*, in the manner and for the purpose herein specified.

No. 37,713.—D. VAN HOUTON, of Fuller's Corners, Whitley county, Ind.—*Improvement in Horse-Powers.*—Patent dated February 17, 1863.—The invention consists in the arrangement of the parts which are specifically detailed in the claim, the object being to attain high speed within a frame of moderate dimensions. The power is derived from sweeps or levers attached to the large driving wheel *C*.

Claim.—The arrangement of the four shafts *B D F* and *L*, provided, respectively, with the wheel *C*, pulleys *g I*, pulley *G*, and bevelled wheel *J*, and the bevel pinion *K* and pulley *M*, in connexion with the belts *E H*, to form a new and improved horse-power, as herein set forth.

No. 37,714.—E. R. WAIT and J. WILLARD PHELPS, of Ravenna, Ohio.—*Improvement in Watches.*—Patent dated February 17, 1863.—The main wheel is attached loosely to the barrel, and a ratchet fast to the barrel transmits power to the main wheel by pressure upon click attached to the latter.

Claim.—The main wheel attached loosely to the barrel, and employing a ratchet to transmit the power from the barrel to the said wheel, substantially as herein specified.

No. 37,715.—S. S. WILLIAMS, of Pittsburg, Pa., assignor to HARRY J. BAILEY, of same place.—*Improvement in Water Elevators.*—Patent dated February 17, 1863.—The invention consists of balancing buckets, one on each side of the windlass, each bucket having a valve in its side near the bottom, which, when it has attained the proper height, is withdrawn inwardly by means of a trigger which forms the tail of a pivoted lever on which the valve is fixed, and which, coming in contact with an inclined edge, opens the valve.

Claim.—The combination and arrangement of the parts as herein specified and shown, for the purposes as set forth.

No. 37,716.—GEORGE D. BAYLEY, of Lebanon, Grafton county, N. H., assignor to GILES B. JOHNSON, of Boston, Mass.—*Improved Dredging-Box with Grater and Cake-Cutter attached.*—Patent dated February 17, 1863.—The interior is divided into spaces for grated material, flour, and a nutmeg box, and the lid forms a cake-cutter, a part of one side forming the grater.

Claim.—As a new article of manufacture the above described article, comprising a grater, dredge-box and cake-cutter combined, substantially as set forth.

No. 37,717.—WILLIAM BOURNE, of Boston, Mass., assignor to NATHANIEL CUMMINGS, of same place.—*Improvement in Piano-Fortes.*—Patent dated February 17, 1863.—This invention consists in the modification of the frame of the piano, so as to permit of an extension of the sounding-board over the whole surface inside the boxing of the instrument.

Claim.—Extending the sounding-board in rear of the hammer passage thereof, and underneath the straining pin bar of the iron frame, and from side to side and end to end of the case, and so suspending the said bar over the part of such board, which is in rear of the hammer passage, that there may be a free or uninterrupted vibration space *f* between the two, substantially as hereinbefore described.

No. 37,718.—P. J. CLARK, of West Meriden, Conn., assignor to S. S. CLARK, of same place.—*Improvement in Lanterns*.—Patent dated February 17, 1863.—The improvement consists in a metallic band, rotating upon the cylindrical portion of the lower or base piece of the lantern, with an opening through the band and through the base, which may be closed or opened by the rotation of the band.

Claim.—As an improved article of manufacture a lantern having its base or lower metallic portion C provided with an opening *c*, and having a movable band E, or a section of a band, fitted upon the base, which band is also provided with an opening *b*, all being arranged in such a manner that, by turning the band, the openings *b c* may be made to register, or be brought in line with each other, or placed out of register or line with each other, for the purposes specified.

No. 37,719.—EDWARD HOLMES, of Buffalo, N. Y., assignor to E. and B. HOLMES, of same place —*Improvement in Hoop driving and Barrel-crozing Machine*.—Patent dated February 17, 1863.—The barrel is set upon a ring and clamped; the ring is then withdrawn to allow play for the crozing, chamfering, and howelling tools which are arranged upon a revolving head affixed to a sleeve, which rotates upon a central shaft whose vertical motion, by means of a toggle, expands and contracts the radius of the circle cut by the said tools.

The disk which carries the drivers, and upon which they are pivoted and made adjustable by vibration from a radial position to one approaching the tangential, is mounted upon the central shaft, and, the drivers being adjusted to the hoop, are forcibly drawn down by hooked arms which are connected to a head and screw at the base of the machine.

Claim.—First, driving hoops on barrels and other casks by power applied to yielding or flexible drivers, substantially as described.

Second, the ring K, or equivalent, on which the barrel stands while the hoops are being driven, and which may be moved out of the way for the operation of the chamfering, crozing, and howelling tools, as set forth.

Third, the arms D, in connexion with the disk D', or equivalents, for the purpose of expanding and contracting the drivers, as set forth.

Fourth, the outer revolving hollow shaft T, which carries the chamfering, crozing, and howelling tools, in combination with an inner shaft, which has a vertical movement for the purpose of imparting a lateral movement to the said tools, or either of them

Fifth, regulating the depth of cut of the chamfering, crozing, and howelling tools (or either of them) by means of a vertical movement of a shaft, nut, or head-piece, to which the said tools (or either of them) are in any manner connected.

Sixth, the construction and use of a hoop-driving machine and a barrel-chamfering and crozing machine in one machine, for the purposes and substantially as described.

No. 37,720.—EDWARD HOLMES, of Buffalo, N. Y., assignor to E. and B. HOLMES, of the same place.—*Improvement in Stave-dressing Machine*.—Patent dated February 17, 1863.—The machine consists of a stationary frame in which the gearing is arranged and operated, and which contains the feeding rollers. The cutter frame rests upon bars which are supported midway of their length by the stationary frame, and the weight of the cutter frame is counterbalanced by weights. Circular cutters above and below operate upon the two faces of the stave, and the cutter frame being hung upon two independent oscillating points of support enables it to vibrate freely and assimilate itself to the shape of the stave.

Claim.—First, supporting the cutter frame upon a journal or journals *c* in such a manner that the frame may oscillate in any direction, according as the varying conditions of the stave to be dressed may require.

Second, in a machine for dressing staves which has an oscillating or movable cutter frame, in connexion with the stationary or gear frame, so supporting the cutter frame as to admit of the use of a weight, or equivalent, as a counterbalance to the cutter frame, substantially as set forth.

Third, the projecting bars D, or equivalent, for the purpose of supporting and connecting the cutter frame to the gear frame, and to allow the cutter frame to oscillate, as set forth.

No. 37,721.—EDMUND B. JUCKET, of New Haven, Conn., assignor to Himself and JOHN W. DE LAMATER, of New York, N. Y.—*Improvement in Hose Couplings*.—Patent dated February 17, 1863.—The overlapping section of this coupling has a set of pivoted levers in slots, which, by the rotation of an encircling ring with studs on its surface, are made to project into a groove on the periphery of the inner section, and thereby lock the two sections of the hose coupling together. They are uncoupled by rotation of the ring in the reverse direction, which brings studs on the inner side of the ring to bear on the tails of the lever and retract them within the slots and out of the groove in the inner section.

Claim.—First, the lever or levers *a*, when the same are combined with hose couplings, in the manner and for the purpose substantially as herein set forth.

Second, the combination and arrangement described of the lever or levers *a* and ring C with the hose couplings, when the same are made to operate substantially as herein specified.

No. 37,722.—JOHN S. LOOMIS and ABEL THOMPSON, of Brooklyn, N. Y., assignors to ABEL THOMPSON, aforesaid.—*Improved Bungs for Coal-Oil Barrels, &c.*—Patent dated February 17, 1863.—A metallic ring is firmly set in the staves having a thread on the inside and a thimble with a flange screwed into this ring from the inside, so that the flange binds down firmly upon the metallic lining of the cask. A bung, with the same thread on its periphery, is then introduced from the outside and screwed down upon the end of the thimble.

Claim.—The ring *a* retained in the staves, substantially as specified, in combination with the screw thimble *b* and bung *f*, for the purposes and as set forth.

No. 37,723.—JOHN KEEN MILLNER, of New York, N. Y., assignor to Himself and SAMUEL T. SUIT.—*Improvement in Breech-loading Fire-arms.*—Patent dated February 17, 1863.—Near the rear end and in the side of the barrel is an orifice through which to introduce a cartridge; this opening is closed and the cartridge pushed into the barrel of the piece by a breech-pin which occupies the bore of the gun from the base of the cartridge to the extreme rear end, terminating in a flange and handle. To withdraw this, it is first rotated by the vibration of the handle to disengage a pin or stud which prevents its recoil and then retracting it longitudinally, the said stud traversing a groove on the side of the breech-pin. When the cartridge is placed in the orifice the breech-pin is returned by the corresponding motions to its place closing the breech.

Claim.—The combining the breech-pin *C* with the open after end of a rifle barrel which has a longitudinal loading aperture *B B* therein, when the said breech-pin is guided in its movements, secured in its positions, and is made to operate in conjunction with said loading aperture, the hammer of the lock and a primed metallic cartridge placed in the chamber of the barrel, all substantially as herein set forth.

No. 37,724.—GEORGE W. NEWELL, of Lawrence, Mass., assignor to S. M. DAVIS, of the same place.—*Improved Clothes-Dryer.*—Patent dated February 17, 1863.—The frame of this dryer consists of four standards or bars pivoted one to each side of a square hub like a double X. From near the top of these bars are shorter bars converging to a central head which has a central bar depending and reaching the hub. Cords are stretched horizontally from bar to bar in the standards, and also the converging set above, for the purpose of hanging the clothes on.

Claim.—The hub *A* with the bars *B* attached by pivots *a*, in combination with the supplemental bars *C* attached to the bars *B* by links or joints *b*, and the pendant bar *E* attached to the bars *C* by the head *D*, the bars *B C* being provided with cords *F G*, and all arranged as and for the purpose set forth.

No. 37,725.—A. B. SOUTHWICK and H. E. GRANDY, of Ballardsvale, Essex county, Mass., assignors to the WHIPPLE FILE MANUFACTURING COMPANY, of the same place.—*Improvement in Machines for Cutting Rasps.*—Patent dated February 17, 1863.—The blank is fed continuously and vertically by means of a screw which is attached to the blank holder. The pointed cutter is thrown by a spring to give the blow, and is moved by a cam across the face of the blank, so as to place the teeth or raised projections in rows. As the rows are designed to be across the face of the blank perpendicular to its length, and the blank is constantly moving, the cutter carriage runs on inclined ways so as to allow for the motion of the blank between each stroke. The cutter head is secured to the extremity of a vibrating arm, and the cutter, which is made by pointing a three-sided piece of steel, is secured in it by passing it through a mortise, and inserting into a second intersecting mortise at right angles with the former a bar of steel with a triangular notch to accommodate the cutter.

Claim.—The inclined ways *H*, in connexion with the cutter carriage, as set forth, for the purpose specified.

Also, the method herein described of securing the cutter to its head by means of the mortise *m*, the notched bar *s*, and the screw *h*, operating as described.

No. 37,726.—CHARLES H. MORGAN, of Philadelphia, Pa.—*Improvement in Paper Bag Machines.*—Patent dated February 17, 1863.—The paper is taken from the roller continuously, and folded around a bar, having in its progress its seam pasted and pressed; as it passes off the bar it is seized by a pair of rollers which hold the end, while a revolving knife severs the bag at the end of the bar, cutting with such a degree of obliquity to the axis of the bar that it leaves an upper overlapping edge. Passing from this point, the tube is projected over the edge of a blade, which, rising from a deposit of paste, pastes and folds the bag by pressing it between a pair of rollers, which seize it, press the lap, and discharge it from the machine.

Claim.—The machine, as a whole, composed of elements combined, arranged, and operating substantially as herein set forth.

Also, the use of constantly moving feed rolls acting in combination with a tube-supporting bar, substantially as set forth.

Also, the use of a revolving blade acting in combination with a tube-supporting bar to sever portions of tube with overlapping ends, substantially as herein set forth.

Also, the use of rolls to hold the tube, while being cut off, and to act in combination with a pasting and folding blade in forming the bottom of the bag, substantially as set forth.

No. 37,727.—GEORGE H. REYNOLDS, of New York, N. Y.—*Lithographic Printing Press*.—Patent dated February 17, 1863.—The points of improvement in this machine are in the method of moving the bed; in the construction of the dampening roller; in devices for raising and lowering it and controlling the admission of water to it; in supplying ink to the inking roller and operating the duct roller; in the adjustment of the extent of contact between the fountain roll and the duct roller; in the application of springs to the doctor of the fountain; in the method of adjusting the impression; in devices for lifting the scraper at any required portion of the stroke; in the devices for stopping the tympan-frame always in one position, and starting it at the return movement of the bed and at the proper time; in devices for regulating the number of movements of the bed corresponding to each impression; in the method of removing the printed sheet from the tympan and in securing an accurate register.

These are the points involved in the patent, but their voluminous character precludes a specific description within moderate limits.

Claim.—First, the employment of the flanges *n* on the interior surface of the dampening roller N, in connexion with alternate holes in the water tube N', substantially as and for the purpose specified.

Second, the combination of the cam-shaped pieces O, shaft I2, arm i3, and studs h2 and h4, with the dampening roller N, substantially as and for the purpose specified.

Third, controlling the admission of water to the dampening roller N of a lithographic press by means of atmospheric pressure, substantially as herein described.

Fourth, the combination and arrangement of the rollers I', shaft I2, balance weight W, arm i3, and studs or stops h2 h2, for the purpose of transferring the ink from the cylinder J to the inking rollers I, substantially as herein described.

Fifth, the combination of the arm m2, spring m3, forked arm m4, and duct roller M, substantially as and for the purpose set forth.

Sixth, the combination of the multiple cam k', fountain roller K, arm m2, and duct roller M, arranged substantially as described and for the purpose specified.

Seventh, the employment of the springs k4, between the set screws k3 and the fountain K', for the purpose above set forth.

Eighth, the combination and arrangement of the inclines P2 P3, pins q2, springs q', and scraper bar Q, for the purpose of adjusting the pressure upon the scraper, substantially as herein described.

Ninth, the combination of the wheels R, having one flattened side, with the planes h3, for stopping the tympan frame in the proper position, as herein described.

Tenth, the employment of the sliding teeth S, in combination with the flattened wheels R, and rack H, substantially as described, for the purpose of causing the wheels R to engage the said racks after having been stopped.

Eleventh, in combination with the sliding teeth S, the adjustable slotted pieces S', for operating the said teeth, substantially as herein specified.

Twelfth, in combination therewith the disks T, wrist pin t2, and stops t3, for operating and controlling the said pieces S'.

Thirteenth, the combination of the slotted arms or disks u, shaft U, cams V, and sliding spring bars v, or their respective equivalents, for operating the disks T, substantially as herein set forth.

Fourteenth, the combination of the shaft U, levers u2 and u6, and the studs u3 and u9 attached to the reciprocating bed F, for the purpose of operating the shaft U, and consequently the sliding teeth S, from the reciprocations of the bed F, substantially as herein described.

Fifteenth, the ratchet wheel u5, and pawls u7 and u10, in combination with the shaft U, lever u6, and adjustable stop or stud u9, for the purpose of regulating the number of movements of the bed to each impression, substantially as set forth.

Sixteenth, the cam u12 for lifting the pawls u7 and u10 out of contact with the teeth of the ratchet wheel u5, in combination with the said ratchet wheel, to permit the return motion of U, substantially as herein described.

Seventeenth, the cam u13, in combination with the pawl u7, lever u6, ratchet wheel u5, and retaining pawl u10, for bringing the said pawls into action, substantially as above set forth.

Eighteenth, the arrangement of the pulleys x, spring pieces x', fingers x2, and roller Y, for removing the sheet from the tympan, substantially as specified.

Nineteenth, the employment of the registering points r3 in the revolving tympan frame R', for the purpose above set forth.

No. 37,728.—STEPHEN M. ALLEN, of Boston, Mass.—*Improved Manufacture of Carpet Lining*.—Patent dated February 24, 1863.—This carpet lining consists of soft felt, made of flax, jute, hair, and wool, with a surface of hard paper pasted to its upper side. The fabric thus formed is laid upon the floor, with the paper surface upward, and the carpet is spread thereon.

Claim.—The improvement in the manufacture of fabrics for underlaying carpets, &c., the same consisting in permanently combining with or forming upon soft sheets of felt of any desired thickness a smooth and compact facing of paper or other similar surface, substantially in the mode hereinabove described.

No. 37,729.—B. F. ALLISON, of West Dayton, Iowa.—*Improvement in Fences.*—Patent dated February 24, 1863.—This invention consists in the use of clamps, with a double-shouldered recess in the middle and a recess at each end, which clamps are slid lengthways into mortises in the end posts of adjoining panels of a fence, and then turned horizontally, the shoulders of the recess catching over the posts. A clamp may be used, also, with only one recess in the centre, and inserted the same way. Keys or wedges are used to hold the clamp in the mortises.

Claim.—First, the arrangement of the double-shouldered recess *d*, and recesses *d*^{*}, in the clamp D, in combination with mortises *f* in the end battens *a*^{*}, and with secondary battens *a*'^{*}, and keys *h*, all constructed and operating substantially in the manner and for the purpose shown and described.

Second, the employment or use of a clamp E, with central recess *e*, in combination with mortises *g* in the end battens, and with secondary battens and keys *i*, all as and for the purpose specified.

No. 37,730.—CHARLES L. BOTTUM, of Dansville, N. Y.—*Improvement in Churns.*—Patent dated February 24, 1863.—The dasher consists of an inverted cone with perforated or slotted sides, and has a reciprocating vertical motion by means of its shaft, which is attached to a lever; the fulcrum and the point of attachment of the dasher shaft being adjustable.

Claim.—First, the use of the angular dasher B, as seen in Fig. 1, and its various modifications, as shown in Figs. 2 and 3, with or without the adjustable rod *f*, substantially as set forth and for the purpose described.

Second, the use of the angular dasher B, with its modifications, in combination with the rod *f*, the adjustable standard or fulcrum D, the lever C, and the churn A, substantially as described.

No. 37,731.—RICHARD C. BRISTOL, of Chicago, Ill.—*Improvement in Feed-water Heater for Steam Boilers.*—Patent dated February 24, 1863.—The heater consists of a chamber with horizontal divisions, or floor perforated for the percolation of the water, which is introduced in small jets or streams; the exhaust steam circulates in all parts of the chamber, and gives off its heat to the trickling water and the plates; the water is taken off to the boiler from the lower portion of the chamber so as to avoid taking the oil which may be present.

Claim.—First, the combination of plates perforated to a greater or less extent over their surface with shell or case of feed-water heaters of steam generators or boilers, for the purpose set forth.

Second, the combination of the bent tube, or its equivalent, with a feed-water heater of steam generators or boilers, for the purpose set forth.

Third, the combination of the well-bent tube and feed-water heater of a steam generator or steam boiler, substantially as and for the purpose set forth.

No. 37,732.—A. M. BRUCKHART, of Brunnersville, Lancaster county, Pa.—*Improvement in Elevating Millstones.*—Patent dated February 24, 1863.—On the end of a crane projecting over the millstone to be raised is a bevel wheel with a thread through its axis; through its centre is a screw which passes downwards, and is connected by two oppositely projecting hooks and two rods with the millstone; the bevel wheel being rotated by the means of a bevel pinion and winch, the screw is raised with its suspended millstone.

Claim.—The screw H, provided at its lower end with two oppositely projecting hooks *c c*, bevel wheel F, pinion G, and winch J, in combination with the metal cap *f*, stud shaft *g*, horizontal arm A, and hooks *d d*, when the whole is arranged to operate in the manner and for the purpose specified.

No. 37,733.—N. F. BURNHAM, of York, Pa.—*Improvement in Water-Wheels.*—Patent dated February 24, 1863.—The improvement consists in the application to "centre discharge" water-wheels of a flanged rim set upon the floor of the scroll, and the flange extending into the discharge aperture. This rim fits snugly against the rim of the wheel and prevents the leakage of water.

Claim.—The ring D, provided with the flange *i*, and arranged in relation with the opening *h*, the scroll and rim *f* of the wheel, to operate as and for the purpose herein set forth.

No. 37,734.—IRA COGSWELL, jr., Earlville, La Salle county, Ill.—*Improvement in Calash or Folding-top for Carriages.*—Patent dated February 24, 1863.—The object of this improvement is to construct a folding top or calash, which shall have a greater range of adjustment and be capable of being stored compactly away above the seat; this is accomplished by pivoting the bows to an inclined bar of the same length. (viewed in elevation,)

so that as the inclined bar is more and more depressed by the shifting of the hook and the collapse of the toggle or jointed lever, the top is more and more projected forward, or the bows consecutively folded backward, lying in a series around the top of the seat of the carriage.

Claim.—The combination of the inclined arms E E, hooks K, and folding bars F F, with the bars I J, bows G G' G'' G''', and seat B, all in the manner herein shown and described.

No. 37,735.—D. M. COOK, of Mansfield, Richland county, Ohio.—*Improved Cellular or Tubular Boiler for Evaporating Pans.*—Patent dated February 24, 1863.—In this apparatus a cellular or tubular boiler is placed at one end of a shallow evaporating pan so as to bring the juice to a given heat previous to its being defecated and evaporated in the pan; and, further, in extending the sides of the cellular boiler over the edge of the furnace so as to form a cooling portion for the gathering of the feculent matter.

Claim.—First, a cellular or tubular boiler, substantially as described, adapted for application to a shallow evaporating pan, substantially as described and for the purpose set forth.

Second, the combination of a boiler with deep cells or tubes, a furnace and a shallow evaporating pan, substantially in the manner described.

Third, constructing the cellular or tubular boiler with cooling or extending sides; and also applying it to the throat of a furnace, substantially in the manner and for the purpose set forth.

No. 37,736.—D. M. COOK, of Mansfield, Richland county, Ohio.—*Improved Evaporating Pans with Cellular Boilers.*—Patent dated February 24, 1863.—This invention consists of a shallow evaporating pan with a deeper cellular portion at one end, intended to bring the juice to a certain temperature before it starts on its course along the zigzag passage formed by the scum-arresting partitions of the evaporator.

These cells project down into the throat of the furnace, and the latter is furnished with directors or deflecting plates or walls, which narrow and compel the flame or heat to pass around the fire-exposed surface of the cells at all points except the open top.

Claim.—First, a cellular boiler and a shallow evaporating pan united, substantially in the manner and for the purpose described.

Second, the arrangement of the directors *d d' d'*, in combination with the cellular boiler and shallow evaporating pan, substantially as and for the purpose described.

No. 37,737.—D. M. COOK, of Mansfield, Richland county, Ohio.—*Improved Evaporating Pan with Tubular Boilers.*—Patent dated February 24, 1863.—In this apparatus there is a deep boiler connected with the shallow evaporating pan, the former being divided up into narrow cells by means of tubes, which form flame flues; there is also an arrangement of flame directors, whereby the flame is turned at right angles, when it arrives at the flues and takes its course through them to the smoke-stack.

Claim.—First, a shallow evaporating pan constructed with a deep boiler, when the boiler is divided into cells by means of tubes which form flame flues, substantially as herein described.

Second, the arrangement of the directors *d e*, with respect to the combined boiler and shallow evaporating pan, substantially as and for the purpose described.

No. 37,738.—PHYLANDER DANIELS, of Le Roy, Genesee county, N. Y.—*Improvement in Supports for Artificial Legs.*—Patent dated February 24, 1863.—A shoulder saddle composed of a pad and rollers pivoted in supports is suitably braced to the body by cross and direct straps. Over this a strap runs upon the rollers, its two ends being connected to the upper part of the limb socket.

Claim.—The shoulder saddle C, provided with friction rollers *c c*, over which passes the strap D, secured at its ends to the artificial limb, for the purpose of suitably supporting the same and allowing the free and easy motions of the body, arranged, combined and operating substantially as herein set forth.

No. 37,739.—DANIEL M. DEVOE, of New York, N. Y.—*Improved Clothes Dryer.*—Patent dated February 17, 1863.—The semicircular case is provided with slats occupying a vertical position when folded away; but, when drawn down, forming radial horizontal bars to hang clothes upon, being sustained in this position by the end which underlies a flange in the semicircular bottom of the case.

Claim.—The arrangement of the semicircular slotted case A, provided with springs *e* on top, and with a continuous stop *h*, or its equivalent, on the bottom, in combination with a series of radial folding bars *b*, all constructed and operating in the manner and for the purpose shown and described.

No. 37,740.—JAMES M. DECK, of Buffalo, New York.—*Improvement in Ploughs.*—Patent dated February 24, 1863.—The iron beam of this plough is secured so as to give attachment for the sole, share, and landside, and from the latter to the mould-board.

Claim.—The combination of the curved iron beam F attached to the landside E, as shown and described, with the mould-board D and the share A, or cutting part of the plough, when the whole are constructed and arranged as herein described and set forth.

No. 37,741.—JAMES DONNELL, of Davenport, Iowa.—*Improvement in Bee-hives*.—Patent dated February 24, 1863.—Beneath the main apartment of the hive is a chamber whose floor is of perforated metal or wire gauze. Suspended above this perforated bottom is a box or tray which admits ventilation around it, darkens the hive by interposition between the opening and the combs, and catches the refuse from the comb.

Claim.—The drawer C, made in the manner described and arranged in relation to the hive and comb frame, as set forth, so as to ventilate the comb, and, at the same time, exclude the light therefrom and catch the refuse from the hive.

No. 37,742.—JACOB DUNTON, of Philadelphia, Pa.—*Improved Pack Saddle*.—Patent dated February 24, 1863.—Two rectangular boxes are attached at the diagonal corners by a hinge composed of a metal strap on each, and a pintle and socket on the respective pieces. Beneath each of these is a pocket and a pad adapted to fit the animal's back, and in the rectangular interval formed above the boxes a third is placed, having a strap on each upper side, which enters a staple on the adjacent faces of the boxes on which it lies, being secured against longitudinal displacement by the joint of the hinge.

Claim.—First, a pack saddle consisting of two disconnected bars or pads C C, attached respectively to two cases or panniers A A', connected together by any suitable means, substantially as herein described and for the purposes set forth.

Second, the combination of the two panniers or cases A A, connecting links B B', and upper case A'', when the whole are constructed and arranged in the manner herein shown and described, so that the connecting links of the lower cases shall serve to prevent longitudinal displacement of the upper one, as explained.

Third, the pockets D D', in the described combination with the cases or panniers A A' and bars C C', for the purpose explained.

No. 37,743.—FRANCOIS DURAND, of Paris, France.—*Improvement in Cotton Gins*.—Patent dated February 24, 1863.—Patented in France, July 18, 1862.—The raw cotton is taken from the table by a pair of intermittently feeding rollers made of elastic material, and is then grasped by a pair of hard metal rollers which drag the cotton into the interior of the drum, where it is exposed to the continued action of beaters, which separate the seed and allow it to fall out at the bottom of the drum. The drum, with its pair of rollers, is then rotated part of a revolution until the roller comes opposite to a helicoidal brush. The rollers, while taking in the cotton from the table, are revolved one way, but their presentation to the brush changes their motion, and they now feed out the cotton from the interior of the drum, where it is exposed to the operation of the helicoidal brush and discharged on to another table.

Claim.—First, in combination with the feeding rolls and brush, the carrying and crushing rolls *i i'*, for taking the cotton from the feed rolls to the brush, and at the same time crushing the seed therein, substantially as described.

Second, in combination with the traversing and rotating carrying rolls *i i'*, the intermittently feeding rolls *f f*, so that while the rolls *i i'* are not receiving cotton, the feed rolls shall be in a state of rest substantially as described.

Third, in combination with the traversing and rotating rolls *i i*, the drum *k* and revolving beaters or blades *t*, made and operating together substantially as described and for the purpose set forth.

No. 37,744.—WARREN A. DURRIN, of Milledgeville, Carroll county, Ill.—*Improvement in Stock Pumps*.—Patent dated February 24, 1863.—The animal, in coming to drink at this trough, stands upon an inclined movable platform like an endless chain horse-power, which, moving under him, operates a pump to fill the trough.

Claim.—The combination of the inclined endless apron A A and frame B B, in connexion with the governor D D and brakes R and S, and the pitman F, when applied to operate a pump, as and in the manner delineated and specified.

No. 37,745.—WARREN L. FISH, of Newark, N. J.—*Improvement in Apparatus for Cooking with Gas*.—Patent dated February 24, 1863.—This consists of a vessel with a central chimney passing through it, and beneath is a chamber with a perforated bottom and windows in the sides, in which a jet or jets of gas are burnt to impart heat to the contents of the vessel above the chamber and around the chimney.

Claim.—First, the herein-described gas-heating and cooking apparatus, the same consisting essentially in the combination of a cylinder, or its equivalent, closed at the bottom by a perforated plate, and surrounding one or more jets of gas, as shown, with a chimney arranged to operate substantially in the manner and for the purposes set forth.

Second, in combination with the cylinder surrounding the flame or flames, perforated bottom and chimney, the making of the said cylinder of a transparent material, or providing it with one or more windows, substantially in the manner and for the purposes set forth.

Third, in combination with the cylinder surrounding one or more flames, and closed at the bottom by a perforated plate, as described, of a heating vessel with a central flue, so shaped as to constitute the chimney to operate substantially as and for the purposes set forth.

No. 37,746.—JAMES P. GAY, of Cincinnati, Ohio.—*Improved Composition for Lubricating Wagon Axles, &c.*—Patent dated February 24, 1863.—Take of the pitchy residuum of fatty acids three parts; petroleum or lard-oil one part; warm, mix, and incorporate. In summer less oil.

Claim.—The improved wagon tar herein described, consisting of the ingredients specified, combined substantially in the manner and in the proportions herein stated.

No. 37,747.—STEPHEN J. GEOHEGAN and WILLIAM ULMER, of New York, N. Y.—*Improvement in Bung Socket and Plugs for Barrels.*—Patent dated February 24, 1863.—A metallic socket with a thread inside is sunk into the stave, and a plug to match it, with a square for a turn-wrench is inserted into the socket, with an annular packing on the contracting faces, and screwed down even with the outer surface.

Claim.—The socket A and plug D d', adapted to apply to the stave C, and to sink even with the exterior surface thereof, substantially as and with the effect herein set forth.

No. 37,748.—Suspended.

No. 37,749.—JAMES B. GRAY, of Hudson, St. Croix county, Wisconsin.—*Improvement in Mode of Operating Weather Strips.*—Patent dated February 24, 1863.—In this invention there are two strips, one permanent and attached in the usual way to the door, and the other hinged to the sill. An eccentric on the jamb, to which the door is hinged, is rotated by the closing of the door, and the sill-strip is lifted by a rod so as to come up under the door-strip and close the opening against the weather.

Claim.—The combination of the eccentric g (whether used on one or the other, or both jambs of the doorway) with the strips c and a, by means of the rod or wire l, substantially as and for the purposes hereinbefore set forth.

Also, the washer m, in combination with the eccentric g, made, constructed, and used as and for the purposes herein set forth.

No. 37,750.—JACOB HAEGE, of Shiloh, St. Clair county, Illinois.—*Improvement in Gang Ploughs.*—Patent dated February 24, 1863.—The beam to which the gang of ploughs is attached is fastened to the axle at its point, and in other places, by pins and chains, so as to give it some play and allow it to become detached when it meets with an obstruction. The ploughs are preceded by rotary cutters on a dependant arm, and the last plough in the gang, constructed as a subsoil plough, has the share and cutter suspended from the beam by a rod.

Claim.—First, the attaching of the plough beam to the axle A by means of the stirrup or loop Q, pin S, and chains d' d', and bar T, and wooden pin e', in combination with the lever or treadle J, all arranged as shown, whereby the plough or ploughs may be readily raised above the surface of the ground when necessary, and the beam allowed to become detached from the axle or carriage when the former comes in contact with any obstruction which may lie in their path.

Second, the rotary cutters I, when placed on a screw-rod or shaft H, and secured thereon by jamb nuts i, and said shaft hung in the arms G G, substantially as and for the purpose specified.

Third, the combination of the bar Z, cutter B', when applied to the subsoil plough X, and used in connexion with a gang plough for the purpose set forth.

No. 37,751.—ROBERT HAMILTON, of Franklin, Johnson county, Ind.—*Improved Sugar Evaporator.*—Patent dated February 24, 1863.—The apparatus consists of a pan which has two transverse partitions formed of wire gauze, and a final boiling pan further towards the rear of the furnace which is hinged at one edge, so as to be discharged by tipping. A chimney rises from the rear of each pan, and a damper in the furnace directs the heat up either chimney.

Claim.—First, the arrangement of first and final boiling pans B C C D and F, chimneys G and H, and damper I, substantially as and for the purposes set forth.

Second, the described arrangement of hinged and removable final boiling pan F and supporting rack M.

No. 37,752.—EZRA HASKELL, of Canton, Norfolk county, Mass.—*Improved Portable Bookcase.*—Patent dated February 24, 1863.—The sides of the bookcase are made folding, and when erected the shelves are slipped into dovetailed grooves in the sides, so as to lock them together. The shelf and its back board are fastened permanently together, and for transportation two shelves with their backs make a box to carry books.

Claim.—The series of removable shelves C D, &c., composed of pieces b c d, which, when two shelves are placed together, form a box, as represented in Fig. 6, in combination with the folding sides A B, substantially as described.

No. 37,753.—GEORGE D. HAWORTH, of Decatur, Macon county, Ill.—*Improvement in Seeding Machines.*—Patent dated February 24, 1863.—Attached to a bar back of the wheels on which the frame rests are scrapers, which, by the reciprocating motion of the bar, are made to scrape the wheels and remove accumulations of soil.

Claim.—The scrapers P P when attached to a sliding bar O, arranged as shown, to admit of the scrapers being passed laterally over the surfaces of the wheels C, when necessary, and not be in contact with the latter when not desired for use, as herein set forth.

No. 37,754.—CHARLES W. S. HEATON, of Belleville, St. Clair county, Ill., assignor to J. J. PIGGOTT and HENRY RENTCHLER, of same place.—*Improvement in Corn Planters.*—Patent dated February 24, 1863.—This machine, mounted on wheels, is intended to plant two check rows at once, and the novelty of the devices particularly refers to the dropping and covering arrangements, which are duplicated, one for each row. The corn is placed in hoppers, on the floor of which a slide valve works, having four holes arranged in a rhomb for the reception of corn, and which, on retraction, drop it down two channels; at the foot of these is another slide valve with holes which drop the corn immediately behind the share. These two slide valves are connected by a rocking lever, so that their action is alternate, and the upper one is in the hopper obtaining a supply while the lower one is discharging.

The corn is covered by a roller attached to a dragging frame, on which is a box to hold the necessary weight.

Claim.—First, the employment of two alternating slide valves, in connexion with separate channels, substantially as and for the purpose set forth.

Second, the arrangement of the holes in the valves and the arrangement of the tubes, on a rhomb instead of a square, for the purpose set forth.

Third, the combination of the tooth or share, two valves and a series of tubes or channels, substantially as and for the purpose set forth.

Fourth, the employment of weight boxes in connexion with a coverer, the whole constructed substantially as and for the purpose described.

Fifth, the arrangement of the devices above claimed in connexion with the frame A A, goose-neck lever, slotted rock-shaft, all constructed and operating substantially as and for the purpose described.

No. 37,755.—AUSTIN D. HOFFMAN, of Bellville, Wayne county, Michigan.—*Improvement in Board Measure.*—Patent dated February 24, 1863.—This device consists of a square stem, each side having two columns of similar graduations, but differently numbered. At the end of the stem is a wheel and a central internal screw with a traversing nut, so arranged that five revolutions of the wheel shall move the nut, and the index fingers on the outside, from one of the graduated marks to the next; and on a central column each revolution may be read off.

The wheel is marked with eight circles to correspond with eight columns, and each of the circles and its corresponding column is designed for a specific length of board, as 10 feet, 12 feet, &c.; each of these circles is divided into as many divisions as correspond with the number for which it is intended to be used.

The edge of the wheel, the index on the wheel, as well as those on the stem, being at zero, is rolled on the end of the board, beginning with zero at the starting edge, and the first series is indicated on the face of the wheel, and the number of revolutions on the stem, so that after passing in this way over the ends of all the boards, the reading of the result may be seen on the stem, plus the amount on the index, in the column and circle of the figure which corresponds with the length of the board.

Claim.—The dial wheel B, having several circles differently graduated, in combination with the indices E, and several scales or columns of figures, all arranged to measure different lengths of lumber, substantially in the manner and for the purpose set forth.

No. 37,756.—B. B. HOTCHKISS, of Sharon, Litchfield county, Conn.—*Improvement in Percussion Fuze for Shells.*—Patent dated February 24, 1863.—This invention relates to that class of percussion shells in which fulminates are exploded by a loose hammer in the act of striking the object, and consists in making the sliding hammer with a hard shell or casing and a soft metal interior and base, so that in the act of firing, the inertia of the striker shall bring it against the back end of the interior of the fuze plug, batter up the soft base of the striker, and thus gradually overcome the inertia of the striker, without causing a rebound that might explode the cap; the hard exterior prevents the distortion of the cylindrical form of the striker which would hinder it from sliding easily in the fuze plug.

Claim.—A percussion hammer or striker constructed substantially as herein described, having a hard exterior and a soft interior and base, for the purpose specified.

No. 37,757.—MOSES G. HUBBARD and ANDREW J. SMITH, of Syracuse, N. Y.—*Improvement in Driving Power for Spinners.*—Patent dated February 24, 1863.—The speeder shaft is driven by the pressure upon it of a driving pulley; a driving rim which receives its motion from the machinery impinges upon this pulley, and another rim, similar in shape, which rotates freely on its axis, but has no lateral motion, is connected with the driving rim by parallel bars which work freely in their points of attachment to either wheel; these parallel bars are set at an angle, of say 70 degrees, with the faces of the rim-wheels, and the effect of the device is, that should the resistance of the shaft cause the driving rim to slip on its

surface, the action of the parallel bars which connect the two rims will be to cause a greater pressure of the two rims together, and consequently increase the adhesion of the driving surfaces on the speeder shaft.

Claim.—The construction and arrangement of the parts in such manner as to increase the pressure on the shaft C, by its own resistance and the driving power operating together, for the purposes substantially as set forth.

No. 37,758.—THOMAS KENDALL, sr., of San Francisco, Cal.—*Improved Gold Miners' Washing Pan.*—Patent dated February 24, 1863.—This apparatus is composed of two pans fitting tightly on their upper margins, the outer one having steeper sides, so as to leave a pocket between them. A hole in the bottom is closed by two flanged disks, which are clamped together by a screw bolt, retaining the edge of the orifice between them.

Claim.—The pocket *e*, as formed and made by pans A and D and coupling G, with its parts F and O and packing *v*, with screw Z in combination, as constructed and arranged and substantially described therein.

No. 37,759.—JOHN F. KLEIN, of Trenton, N. J.—*Improvement in Apparatus for determining the Size and Form of the Head and adapting the Hat thereto.*—Patent dated February 24, 1863.—The arms of the conformitor are made to project so far in one direction from the stock that holds them as to serve for taking the form, and shaping a hat to fit it, the projecting end of the arms being of sufficient thickness to allow for the leather lining with which the hat is finished.

The lower ends of the arms are turned out, so as to render it easier to fit it on to the head and to keep it from falling into the hat.

Claim.—A composition constructed substantially as described, to wit: so that it can be used to take the form and size of the head, and then put into a hat to shape it (the hat) to fit the head.

No. 37,760.—LUCIUS J. KNOWLES, of Warren, Worcester county, Mass.—*Improvement in Fancy Looms.*—Patent dated February 24, 1863.—The invention principally consists in the employment of cranks and toothed crank-wheels operating in connexion with revolving lifter and depresser wheels, so arranged that the cranks may be turned to the highest or lowest point of their revolution for the purpose of raising or lowering the heddles or the drop-box, and in this way, for the weaving of checks and figured goods, run the loom with economy of time and power by dispensing with the cam.

There are other points of improvement in this loom which are mentioned in the claim, but the limits of an abstract will not admit of a detailed description.

Claim.—Operating the heddles by means of cranks capable of being turned independently of each other to the opposite extremes of their throws, as indicated by the pattern chain, or its equivalent, substantially as described.

Also, operating movable shuttle-boxes by means of cranks so arranged as to be turned independently of each other from one extreme of their throws to the other, under the direction of a pattern chain, or its equivalent.

Also, the rotating lifter and depresser cylinders, operating as set forth, for the purpose described.

Also, the crank wheels *c c2*, constructed and operating substantially as described for the purpose specified.

Also, the gear *k* and segmental gear wheel *h*, in combination with a rotary lifter and depresser cylinder, for the purpose set forth.

Also, the cam *s* upon the shaft of the wheel *k*, in combination with the ledge *r* upon the segmental gear *h*, for the purpose described.

Also, loosening up the harness cords by means of the vibrating guide rolls, or their equivalents, for the purpose described.

Also, connecting the drop box with the mechanism by which it is operated by means of a cord and pulley, substantially as described.

No. 37,761.—HERBERT MARSHALL, of Dracut, Middlesex county, Mass.—*Improved Pie Stamp.*—Patent dated February 24, 1863.—Attached to the stock is a revolving handle and a revolving crimping wheel with a guide to follow the curve of the pie dish. As the wheel is brought to a place to commence making the print, it is simply drawn around the track as the wheel in its revolution follows the margin of the pie by the automatic rotation of the handle.

Claim.—The combination and arrangement of the revolving handle A with the crimping wheel C and curved lever-guide E, in the manner hereinbefore described and represented in the accompanying drawings.

No. 37,762.—JAMES P. MAYHUGH, of Leitersburg, Washington county, Ind.—*Improved Clothes Frame.*—Patent dated February 24, 1863.—This invention consists of a central casing with slotted vertical faces, and containing within it in a folded or collapsed state the devices upon which to hang the clothes. These consist of three arms hinged on each side at different heights, and connected to a slide which has handles attached; these handles being pulled

out commence to elevate the hanging arms, and pull forward a side plate which fits into the casing, which, as it is protracted, forms a post for supporting the arms in their horizontal position, by dropping the shanks of the handles into notches in the said side plate.

Claim.—First, the use of downwardly-folding arms, in combination with yielding hinges *f'*, operating in the manner described to adapt the arms to fold within a smaller space.

Second, the combination of the slides *E* with the side plates *C*, and arms *F*, substantially as and for the purposes set forth.

Third, the general combination of the centre post *A*, side plates *C C'*, and downwardly-folding arms *F F' F''*, when constructed, arranged, and operating in the manner and for the purposes specified.

No. 37,763.—J. U. MUELLER, of Detroit, Mich.—*Puzzle*.—Patent dated February 24, 1863.—The invention relates to that class of toys in which, by means of several pieces of wood of different colors and different shapes, a variety of figures can be formed. In this case the forms are triangles of two configurations, two of each, in certain relative positions forming a square, and by multiplication of pieces being susceptible of forming a variety of patterns; the peculiar relations of their sides and angles being defined in the claim.

Claim.—The employment or use, in a puzzle, of two different sets of triangles *A B*, which are of such a shape that two sides of each triangle of one set are equal to two sides of each triangle of the other set, and the three angles of the triangles of one set are different from those of the other set, substantially as and for the purpose herein shown and described.

No. 37,764.—CHARLES PERLEY, of New York, N. Y.—*Improvement in Breech-loading Fire-arm*.—Patent dated February 24, 1863.—The breech piece containing the charge chamber swings laterally, being released by a tapering sleeve which is retracted along the barrel to a stop. The breech piece has a connexion obliquely with the axis with a supporting piece which is screwed on to the rear of the barrel, and the fitting of the gas-tight joint between the breech piece and its supporter is adjusted by a set-screw in the extreme rear, working on a conical projection on the rear of the breech piece. The sleeve, when the breech piece is closed, is brought back to its place over the breech and there locked by a catch.

Claim.—The swinging breech or chamber *d*, in combination with the tapering sleeve *g*, and breech supporter *b*, substantially as and for the purposes specified.

Also, in combination with the foregoing, the adjusting screw *l*, hemispherical or conical projection *m*, and the inclined lug *k*, for the purposes and as set forth.

No. 37,765.—CHARLES PERLEY, of New York, N. Y.—*Improvement in End-thrust Bearings*.—Patent dated February 24, 1863.—On the propeller shaft is a collar having a circular groove on its face; in this groove are friction balls which run on an annular plate which abuts against the journal-box through which the shaft passes.

Claim.—The collar *d* and balls *i i*, arranged and applied as set forth, to take the end-thrust of the propeller shaft, as specified.

No. 37,766.—CHARLES PERLEY, of New York, N. Y.—*Improvement in Travelling Batteries*.—Patent dated February 24, 1863.—This battery is mounted upon wheels, and has plated sides and a V-shaped forward part to deflect balls; it has also a frame to precede it similar to a cow-catcher, and mounts a swivel gun, to be fired through port holes. The floor of the car between the pairs of wheels hangs low near the rails, and has rails affixed to it for the purpose of restoring the battery to the track if it has been run off, and removable where it is necessary, to repair the track.

Claim.—The travelling battery specified, provided with the V-shaped end *e*, and inclines *e'*, as set forth.

Also, the arrangement of the movable platform sections *h h*, as and for the purposes specified.

Also, providing the movable platform sections *h h*, with the rails *4 4*, for the purposes and as set forth.

No. 37,767.—CHARLES PERLEY, of New York, N. Y.—*Improvement in Hose Coupling*.—Patent dated February 24, 1863.—The two flanges on the ends of the pipes are coupled together by a hinged clasp, which locks down upon them and is screwed in position.

Claim.—A hose coupling having the hinged clasp *c d*, fitted with the screw *f*, and receiving the flanges *1 2*, in the manner and for the purposes set forth.

No. 37,768.—CHARLES PERLEY, of New York, N. Y.—*Improved Steering Apparatus*.—Patent dated February 24, 1863.—The rudder stock is surmounted by a bevel wheel, which is supported on balls running in a groove in it and in the casing surrounding the gearing, the wheel being rotated by a bevel pinion on a horizontal tiller shaft by the ordinary tiller wheel.

Claim.—The arrangement of the horizontal shaft *g*, pinion *k*, and wheel *f*, within and sustained by the casing *c*, as and for the purposes set forth.

Also, the horizontal wheel *f*, in combination with the rudder stock, when fitted substantially as specified, so that the rudder is free to work endwise without disturbing or altering the position of the wheel *f*, as set forth.

No. 37,769.—CHARLES PERLEY, of New York, N. Y.—*Improved Naval Ram for the Destruction of the Enemy's Ships*.—Patent dated February 24, 1863.—A shaft or bolt is constructed, which lies along on the keel of the vessel and capable of being projected through the prow by means of a rack and pinion beneath it. The orifice in the prow through which it passes is guarded by valves inside and outside, when the ram is not run out, and the latter is provided with a charge-chamber and a cutting-edge at its point, and with a weighted-box at its rear to assist its momentum.

Claim.—First, the stop-cock or cocks *d* and *e*, applied at the end of the vessel below the water-line, in combination with the movable ram *a*, for the purposes and as specified.

Second, the circular cutting-edge and the cannon applied to and combined with the movable ram in the manner specified, so that said cannon can be loaded when the ram is drawn into the vessel, or a new cutting-edge substituted, as specified.

Third, the ram fitted to slide in the opening in the vessel through which it is projected, in combination with the weighted-box *h*, contained in the vessel, but not attached thereto, for the purposes and as specified.

No. 37,770.—CHARLES PERLEY, of New York, N. Y.—*Improvement in Closing Doors*.—Patent dated February 24, 1863.—A saddle piece is pivoted to a plate on top of the door with a cord attached to it which passes between horizontal pulleys and then over another pulley, where it hangs within the door casing, having a weight attached. As the door closes under the draught of the cord the saddle piece settles itself between the two horizontal pulleys so as to bring the door to rest parallel with its frame.

Claim.—The saddle piece *i*, receiving the weight cord, in combination with the rollers *e e'*, and acting to close the door, in the manner and as specified.

No. 37,771.—CHARLES PERLEY, of New York, N. Y.—*Improvement in Discharging Shells from Balloons*.—Patent dated February 24, 1863.—The bomb is placed in a basket, which consists of two parts joined by a pin in a barrel. The basket is elevated by a balloon or gas-bag, and a time match lighted, which, as the fire reaches the end, ignites the powder in a nipple and explodes the charge in the barrel, driving out the pin and allowing the bomb to drop.

Claim.—The employment of a divided basket or receptacle, sustained by a gas-bag, and carrying the bomb or other article to be dropped by the opening of said basket, as set forth.

Also, the employment of the hinge-pin *e* and barrel *f*, to disconnect the halves of the basket by firing out the said pin *e*, as set forth.

Also, a bombshell, or its equivalent, attached to and conveyed by a gas-bag, in combination with automatic means for disconnecting the said bomb at a given time, as set forth.

No. 37,772.—TREAT D. PROSSER, of Fond du Lac, Wis.—*Improvement in Ventilators*.—Patent dated February 24, 1863.—The movable perforated disk and the perforated plate on which it works are both made of glass.

Claim.—A ventilator constructed by cutting out suitable orifices in a pane of glass or other transparent substance, and applying thereon a movable disk of a similar transparent material, in the manner substantially as set forth.

No. 37,773.—E. B. REQUA, of Jersey City, N. J.—*Improved Combination of Globe and Chimney for Lamps*.—Patent dated February 24, 1863.—This combined globe and chimney consists of a chimney or neck with an oblate spheroidal top; the point of junction of the two portions being contracted, and the oblate spheroid ground on one side, and plain on the other.

Claim.—The combined globe and chimney composed of the oblate spheroidal part *a* and the conical neck *b*, so arranged that it may be applied to the burner and have the relative position to the jacket and cone thereof and to the flame as herein set forth.

Also, having one side *f* of the part *a* of the globe and chimney ground, and the other side *g* plain or unground, as specified.

Also, forming the upper part of the neck *b* of the globe and chimney with a circumferential sunken portion *a'*, but this only when used with the particular form of a globe and chimney, as herein described.

No. 37,774.—PIERRE EUGENE RICHARDIERE, of Paris, France.—*Improvement in Buttons*.—Patent dated February 24, 1863.—A bar or bolt is formed in the interior of the button, over which the thread may be passed without being exposed on the outer surface of the button.

Claim.—A button, having formed in its interior one or more bars or partitions, over which the thread passes, substantially as herein described, to secure it to the cloth or other material without being exposed on the face of the button.

No. 37,775.—E. H. SAWYERS, of West Grove, Davis county, Iowa.—*Improvement in Cultivators*.—Patent dated February 24, 1863.—This cultivator is suspended beneath a carriage, guided by the driver by means of a lever and a vertical crank rod, which deflects the forward point of the cultivator to the right or left, vibrating on a spindle, which projects downwardly from the carriage. The upper end is attached by a draught rod to the tongue, and its rear is adjusted vertically by a lever and chains.

Claim.—The main frame C, guide rod G, metallic support J, levers H I, rods *a a*, plough frame F, and spindle *j*, the whole combined and arranged to operate in the manner and for the purpose specified.

No. 37,776.—U. A. SHOCKLEY, of Litchfield, Montgomery county, Ill.—*Improvement in Seeding Machines.*—Patent dated February 24, 1863.—This machine consists of a triangular frame, with a wheel at the forward angle, and two seed boxes towards the rear, the forward one for sowing in hills and the rear one for sowing in drills. The gates sliding in the bottoms of the seed troughs are in either case driven by a band from the roller, and when planting in hills the intermittent action is obtained by a toggle, operated by the revolving shaft and connected with the seed slide.

Claim.—The combination, in the manner herein shown and described, of the shaft I, toggle H, the seed slides G G', and lever A', with the shaft D, hoppers C, supporting wheel B, pulleys *c c*, and frame A, all as herein set forth.

No. 37,777.—HENRY SIMON, of Providence, R. I.—*Shirt Studs and Sleeve Button.*—Patent dated February 24, 1863.—The stud is composed of a shell or case of sheet metal with a backing or filling of enamel.

Claim.—The improved stud or button described, composed of a shell of sheet metal with a backing of enamel, the whole article being substantially such as specified.

No. 37,778.—DAVID L. STILES, of Rochester, N. Y.—*Improvement in Cooking Stoves.*—Patent dated February 24, 1863.—The front and rear sides of the elevated oven are provided with flue plates, which are connected at their lower ends and diverge as they rise, so as to compel the heated air to pass to the upper corners of the stove: passing thence, it circulates along the top of the oven, and is deflected downward and up again over the middle of the oven to the exit flue. A heated air chamber, having communication with the outside, is connected with the oven by tubes passing across the flue and thimbles, which are dropped over the tubes through holes in the floor of the oven.

Claim.—The flue plates *b b* and *d d*, conjoined at the bottom but diverging toward the outer corners at the top of the oven, so that the heated air, in equal columns, is concentrated at those corners as it rises, in combination with the interior flue plates *f f* and movable division plates *b b*, in elevated oven stoves, for the purpose of equalizing the heat throughout the same, substantially as set forth.

Also, the arrangement of the loose perforated thimbles *k*, in combination with the stationary heated air tube *i*, substantially as and for the purposes shown and described.

No. 37,779.—LEWIS S. THOMSON, of Brooklyn, N. Y.—*Improved Mosquito Frames.*—Patent dated February 24, 1863.—This frame is made expansible to fit within the casing of a window. The corners are riveted together and the side detached in the middle, so as to be put together by running a sleeve upon them, or detachable, packing them away for transportation or to be laid aside.

Claim.—An expanding mosquito frame formed of bars fitted so as to be increased or decreased in length to fit the window and receiving the netting or gauze, and in combination therewith the joint at the angles, for the purposes specified.

No. 37,780.—SILAS VERNON and NICHOLAS OVERFIELD, of Meskoppan, Wyoming county, Penn.—*Improved Revolving Shelves.*—Patent dated February 24, 1863.—The shelves are affixed to a vertical shaft, which is pivoted above and below. The central shaft is four-sided, with square mortises in the sides at such distances as may be convenient for the shelves; vertical strips are then fastened to the central axis, and through the mortise, of which the strips form one side, the slats for the shelves are arranged. The same construction is repeated on each side.

Claim.—The post A, notched or recessed, as shown, and having the side strips or boards *c* secured to it, in combination with the slats B B', all arranged as shown, to form a new and improved article of manufacture, for the purpose specified.

No. 37,781.—HENRY E. TURNER, of Boston, Mass.—*Improvement in Draught Regulators.*—Patent dated February 24, 1863.—The invention consists in dividing the smoke flue by a vertical partition; that from the fire being commanded by a damper, and that communicating with the exterior by a ventilating register, permits them to be used separately or together, and to dampen the fire or to ventilate, as may be desired.

Claim.—The combination of the register D, the damper E, and the division plate or partition G, operating as set forth, for the purpose described.

No. 37,782.—JAMES WARNER, of Springfield, Mass.—*Improvement in Sights for Firearms.*—Patent dated February 24, 1863.—The two sights are pivoted to a base plate, which is fastened to the barrel of the gun. The higher sight and the base plate are both slit at the hinge end, so that the motion of the screw shall tighten all parts of the joint.

Claim.—The combination of the screwed joint pin, the slit *b* in the base A, and the slit *g* in the leaf B, substantially as herein described, whereby the screwing up of the pin is caused to tighten all parts of the joint.

No. 37,783.—G. A. WATKINS, of Springfield, Windsor county, Vt.—*Improvement in Hooks for Fastening Garments*.—Patent dated February 24, 1863.—A hook is formed with a hole in the flattened shank; through this an eyelet is passed, the fabric or material being between them, and the tube of the eyelet riveted down upon the shank of the hook, constituting a hooked eyelet.

Claim.—A fastening for India-rubber and other blankets and garments designed for military and army use, composed of a hook and an eyelet attached permanently to the shank *a*, substantially as herein shown and described.

No. 37,784.—WILLIAM H. WILSON, of Providence, R. I.—*Sleeve Button*.—Patent dated February 24, 1863.—The invention consists of a bar acting in connexion with two studs on the back of the button to connect the cuffs; the studs or posts which pass through the button-holes are there retained by the vibration of the bar which is attached to one post, engages with a notch in the other, and is retained by an elastic catch which is passed behind a projection on the back of the button.

Claim.—The combination of the two posts *a b*, the bar *B* moving in a plane parallel with the head of the button, the elastic arm *C'*, and the projection *f*, the whole operating substantially as herein specified.

No. 37,785.—J. A. ENGLEHARD, of St. Louis, Mo., assignor to Self and GEORGE HARTMAN, of same place.—*Improved Money Safe for Travellers*.—Patent dated February 24, 1863.—This consists of a flat case to be worn on the breast, slung by straps passing over the shoulders and buckling to the side of the case, which is divided off into pockets for the reception of money, &c.

Claim.—The safe *A*, with its pockets *B D E* and straps *g k* or *m n*, all being constructed and arranged substantially as and for the purposes specified and represented, as a new article of manufacture.

No. 37,786.—JAMES W. GUERNSEY, of Tioga, Pa., assignor to Self and H. A. GUERNSEY, of Wellsborough, Pa.—*Improvement in Hydrant Valves*.—Patent dated February 24, 1863.—Underneath the chamber from which the discharge pipe proceeds is a rotary disk with two openings which permit the water to escape up through them when they are brought to register with the discharge openings in the head of the chamber; the motion of the disk "shuts off" or "lets on" the water, the pressure of the latter keeping the valve to its seat.

Claim.—The employment of the double-way cap *E*, constructed as set forth, in combination with the perforated disk valve *J*, stem *H*, and chamber *A*, all in the manner herein shown and described.

No. 37,787.—ROBERT M. HUGHES, of Oxford, Chester county, Pa., assignor to Self, J. A. BLAKE, and S. WOOD, of Philadelphia, Pa.—*Improvement in Coupling Heads for Railroad Cars*.—Patent dated February 24, 1863.—The heads are counterparts of each other, and a link is permanently connected to each by being hung upon the projecting hook and secured by the pin; when the cars are to be coupled either of the links is introduced into the coupling head of the other car, and as it enters raises the catch lever which it passes, and the latter falling behind it, secures it in position.

Claim.—First, the combination of the coupling head *A* and link *D*, when the latter is permanently connected to the former by the hooked projection *i* and pin *m*, or their equivalents, and when the head is so formed in respect to the link as to allow the same to be raised or lowered, the whole being constructed substantially as and for the purpose herein set forth.

Second, in combination with the said coupling head *A* and link *D*, the catch lever *B*, hung to the head and arranged and operating substantially as and for the purpose specified.

No. 37,788.—DAVID KRAUSER, of Pottsville, Pa., assignor to Self, HENRY P. STICHTER, and LEWIS C. THOMPSON, of same place.—*Improved Ice Caulk*.—Patent dated February 24, 1863.—This caulk is attached to a stirrup or frame, which embraces the heel in such a manner as to be thrown into position under it with the points down, or stowed away in under the shank of the boot when not required for use; to accomplish this motion it is pivoted to the front bar of the frame which surrounds the heel.

Claim.—The heel frame *A*, in combination with the flat plate *C*, when the latter is so attached to the former and arranged in such relation therewith as to admit of being placed directly beneath the heel when the spurs or points *f* are required for use, and admit of being turned over into the hollow of the sole when not required for use, substantially as shown and described.

No. 37,789.—P. B. and L. C. REYNOLDS, of Prophetstown, Whitesides county, Ill., assignors to Themselves and CLARK G. REYNOLDS, all of same place.—*Improvement in Cultivators*.—Patent dated February 24, 1863.—This two-horse cultivator is intended to stir the breadth of two baulks, and has adjustable side beams which carry the shovels so as to bring the rear shovels nearer to the row of corn which is spanned by the machine.

These rear shovels are made adjustable laterally, so as to throw a greater or smaller amount of soil to either side by means of a plate on the side bar to which they are attached, which is rotated and confined to a determinate position by a pin.

Metallic bands which descend from the front bar follow a line below and parallel with the side beams, giving a lower and secondary support to the shovel stocks, which, as the side bars are contracted, move in slots in the middle transverse bar of the frame.

Claim.—First, the arrangement upon adjustable beams B C of two or more pairs of perforated lever adjusting plates H h i, for the purpose of adjusting two or more pairs of shovel stocks G1 G2 t t, in the manner and for the purpose described.

Second, the arrangement of the bent sustaining bars F F, side beams B C, and slots b c s s, in the manner and for the purpose described.

Third, the arrangement of the frame A B C D E, swingletree I, draught rods J J, adjustable hangers K K, perforated lever adjusting plates H H H H, swivelling square or flat top standards G1 G2, bent sustaining bars F F, and slots b c s, the whole constructed and operating together in the manner and for the purposes described.

No. 37,790.—JOHN F. SCHUYLER, of Philadelphia, Pa., assignor to WILLIAM E. LOCKWOOD, of same place.—*Improvement in Machines for Planishing Paper.*—Patent dated February 24, 1863.—Two rollers are suitably journaled in standards, the lower one having a smooth surface and heated by steam, the upper one having a slightly ribbed surface made by draw-filing longitudinally.

A third and smaller roller with a larger diameter at the middle than at its ends is journaled on springs located in front of and between the other rollers.

The paper is passed over the smaller and between the pair of rollers, the lower moving faster than the fabric by the slight retention of the paper by the action of the upper and the supplementary roller.

The slip of the lower roller on the fabric has the effect of planishing it, and the greater middle diameter of the small roller spreads the paper and removes the creases.

Claim.—The use of the smooth planishing roller E, in combination with the pressure roller D, when a number of small longitudinal ridges are formed on the latter roller, as set forth for the purpose specified.

Also, the auxiliary pressure roller K, of the form described, in combination with the upper and lower rollers D and E, for the purpose specified.

No. 37,791.—JOHN F. SCHUYLER, of Philadelphia, Pa., assignor to WILLIAM E. LOCKWOOD, of same place.—*Device for Feeding Paper to Cutting Machines.*—Patent dated February 24, 1863.—The clamp is composed of two plates, which are compressed together by raising a cam lever so as to grasp the edge of a sheet of paper to be pushed towards the cutting apparatus. At the rear end of the clamp is a pawl which engages with the vertical side of notches in a rack let into the table, and, as the pawl comes in contact with a tooth, the cutter descends; the pawl is then tripped out of contact with the tooth, and the paper is pushed along until another tooth is engaged, the distance between the teeth of the rack being the measure of the feed.

Claim.—The clamp composed of plates D and E, the cam lever G, or its equivalent, and the pawl F, the whole being constructed substantially as set forth, and operating in conjunction with a rack B, as specified.

No. 37,792.—JOHN F. SCHUYLER, of Philadelphia, Pa., assignor to WILLIAM E. LOCKWOOD, of same place.—*Improvement in Apparatus for Bending and Folding Paper Collars and other Articles of Apparel.*—Patent dated February 24, 1863.—The fabric to be operated upon is first cut into shape and placed piece by piece upon the endless tapes, being regulated by the motion of a registering arm so as to have the collars the proper distance apart; steam is admitted below and retained by a double inclined roof above, lined with oiled silk, to render the collars flaccid preparatory to their being folded; as they reach the point where the tapes descend a bar falls, which grips the collar by the rear edge, and while it is thus suspended a knife comes forward which pushes it between two rollers that press it flat and discharge it on to a table.

Claim.—First, a trough Y, to which steam is admitted, in combination with the endless traversing tapes x x, the whole being arranged and operating substantially as set forth for the purpose specified.

Second, the roof W, with its lining y of oiled silk, or its equivalent, when arranged in respect to the trough Y and endless tapes x, substantially as and for the purpose set forth.

Third, the registering arms T, or their equivalents, when arranged in respect to and operating in conjunction with the endless tapes, substantially as set forth for the purpose specified.

Fourth, the combination of the bar n, shaft H, with its pulleys, the endless tapes x x, and adjustable ledge 7, the whole being arranged and operating substantially as set forth for the purpose specified.

Fifth, the reciprocating blade J, adjustable ledge 7, folding rolls F and G, and table 4, the whole being arranged and operating as and for the purpose herein set forth.

No. 37,793.—AMOS H. SEARFOSS, of Newark, N. J., assignor to ANNA MARIA HYDE, of same place.—*Improvement in Grinding Mills*.—Patent dated February 24, 1863.—The stones in this mill are set with their surfaces in a vertical plane, the bed stone being fixed to the frame and surrounding a central shaft which has a projecting pintle entering a socket in the axis of the revolving stone. The shaft passing through the bed stone has a spiral groove which connects at one end with the grain in the hopper and at the other discharges it between the stones, the supply from the hopper being regulated by a gate; the revolving stone is adjusted to the bed stone by a screw acting endwise upon the end of its axis.

Claim.—Constructing a vertical mill with its bed stone secured and held to the frame-work in the manner described, combined with a feeding screw and feeding apparatus, arranged, constructed, and operated as described.

No. 37,794.—THOMAS SHAW, of Philadelphia, Pa., assignor to Himself and PHILIP F. JUSTICE, of same place.—*Improved Steam Gauge*.—Patent dated February 24, 1863.—The pressure of steam is indicated by the rise of mercury in a tube from a chamber beneath, where it rests upon a diaphragm of rubber; underneath this is a piston whose lower end, with a disk of rubber intervening, is exposed to the pressure of steam from the boiler, which, raising the piston, drives the mercury up into the tube.

Claim.—An apparatus when arranged substantially as set forth and for the purpose specified.

No. 37,795.—SAMUEL STEINMETZ, of Chicago, Ill., assignor to ANDREW RIERSON, of same place.—*Improvement in Steam Boiler*.—Patent dated February 24, 1863.—The improvement consists in making one part of the shell of the boiler weaker than the rest, and arranging it so that when it gives way it shall be held and controlled to admit of the passage of the steam and retain the portion raised, which, in the illustration, is shown as a valve held down with a determinate pressure by four levers and spring hooks.

Claim.—First, a steam boiler, constructed with a known portion D of its exterior surface or shell, more yielding than the remainder, for the purpose of carrying off any excessive pressure which can possibly occur, the said yielding portion being held and controlled substantially as herein explained so as to be automatically released when raised from its seat, and thus prevent disastrous consequences from an explosion.

Second, the combination of the yielding head D, levers I1 I2 I3 I4, spring hooks J1 J2 J3 J4, and returning spring H, all constructed, arranged, and operating substantially as herein shown and described.

No. 37,796.—AWSBENT H. WAGNER, of Chicago, Ill., assignor to Himself and CHARLES KAESTNER, of same place.—*Improvement in Grinding Mills*.—Patent dated February 24, 1863.—The invention consists in the method of hanging and adjusting the bed stone, which is set with its face in a vertical plane, and is required to be adjustable to the revolving stone, the latter being firmly attached to its axis or shaft, which passes through the bed stone and rests on bearings in the frame beyond. In the rear of the bed stone is a vibrating frame with four arms resting on bearings, and the bed stone resting against it adapts itself vertically and horizontally to the runner. The bed stone is supported at two points by pivots which rest in bearings from the inside of the case. The shoe is shaken by a pin on the shaft coming in contact with a vibrating arm to which it is attached, and agitators on the runner projecting into the eye of the bed stone agitate the grain.

Claim.—The peculiar construction of the vibrating frame M, having four bearings, by which means the stationary stone I can adjust itself vertically and horizontally to the running stone.

Also, the pivots J J, grooves K K, for holding the stone I, when combined with my devices for holding and shaking the shoe R, and the floats or agitators V V, arranged and operating as described.

No. 37,797.—JOEL HOOD, of Milwaukie, Wis.—*Improvement in Snow Scrapers*.—Patent dated February 24, 1863.—This scraper, which is made to fit the rail with a straight edge and a flange, is placed at the end of a pivoted standard which has a backward and forward motion, governed by springs which tend to restore it to the perpendicular. It has also a spring above it, so that obstructions may deflect or raise it without injury. A stirrup passing down from the frame of the car protects it from any considerable lateral displacement.

Claim.—First, the combination of the scraper E, having a tongue or projection F, with the standard A, attached to a frame B by a pin C, and springs M M and I, and connecting rods O O, as and for the purpose herein set forth.

Second, the stirrup L, in combination with the devices or means recited in the above first claim, as herein described.

No. 37,798.—J. L. ALBERGER, of Buffalo, N. Y.—*Improvement in Apparatus for Distilling Coal Oils*.—Patent dated March 3, 1863.—This retort is supported on rollers, so that an oscillating or rotary motion may be imparted to it. The retort is provided with a steam coil for heating, a perforated pipe for introducing at will, either moist or superheated steam to

the body of oil, and a worm to carry off and condense the vapors. Any or all these pipes may pass through suitable stuffing boxes. Moist steam is first introduced, which, condensing, washes the oil, and the latter is gradually raised in temperature until the impurities, coloring matter, and water are driven off and pass through the condenser. Superheated steam is then introduced to evaporate the oil. The entire operation is effected without direct contact of the oil with fire surfaces, and when completed the superheated steam is shut off, and the temperature of the apparatus rapidly reduced for the reception of a new charge.

Claim.—The employment, simultaneously, within an oil-distilling retort, of a steam-supplying and a steam-heating system of pipes, substantially in the manner and for the purpose herein shown and described.

No. 37,799.—WILLIAM W. ANDREWS, of Warrensville, Cuyahoga county, Ohio.—*Improved Boat Detaching Hook.*—Patent dated March 3, 1863.—This invention consists in so constructing a davit hook and eye bolt that the weight of the boat shall keep the hook closed, but when the weight is removed by the flotation of the boat, the hook is cast loose by a spring.

Claim.—The combination in a mechanical apparatus of the hook B, shoulder B'', stud I, lever E, spring G, catch F, and dog C, the several parts being arranged substantially as and for the purpose herein specified.

No. 37,800.—JOHN BABILLION, of Detroit, Wayne county, Mich.—*Improvement in Drying Grain.*—Patent dated March 3, 1863.—The invention consists of a series of floors one above the other, constructed in sections, so that the grain can be dumped from one floor to the other, until discharged by the lower inclined floor.

Claim.—The employment of several floors, arranged one above the other, and so constructed that the sections composing the floors can be dumped, and the grain fall upon the floor below, thereby admitting the grain in process of drying to a series of relays, and when dried, of ready transmission from the machine by tilting the floor B, substantially as described.

No. 37,801.—ABEL H. BARTLETT, of Spuyten Duyvil, West Chester county, N. Y.—*Improved Refrigerator.*—Patent dated March 31, 1863.—This invention consists in a combination which may be described in general terms as an interior inverted conical ice and water chamber, with a number of cold-air or provision chambers on each side, with provision for drainage by pipe and faucet.

Claim.—First, the corrugated metallic ice and water box, constructed and combined with the trough K, the pipes Z and H, the faucets I and J, or their equivalents, and made and arranged substantially as and for the purpose shown and described.

Second, the combination and arrangement of the ice chambers F and W, the plank Y, the reservoir G, the pipes Z and H, the faucet I, or their equivalent, whereby the ice meltings from the chamber W can be either conducted into the reservoir G, and retained with the water therein, or the whole allowed to pass off through the faucet I, and opening X, substantially as and for the purpose shown and described.

No. 37,802.—JOHN BAIRD, of New York, N. Y.—*Improvement in Valves for Steam Engines.*—Patent dated March 3, 1863.—Patented in England, June 21, 1862.—This invention consists in appliances to relieve a slide valve from inordinate pressure, and to hold it steady under the variable pressure at its two ends, and this is accomplished by means of an adjustable face plate between which and the seat the valve works, said plate being operated by keys against which it is supported by springs, the pressure being further equalized by apertures through the valve, which at the proper time communicate with the recesses or pockets in the face plate.

Claim.—First, the combination of a valve with parallel faces with a seat and a face plate, all operating substantially as described, by means of keys supporting the face plate and permitting its adjustment, substantially in the manner specified.

Second, in combination keys to support a face plate, springs to hold the latter in contact with the former, a face plate and a sliding valve with parallel faces, the combination being substantially such as specified.

Third, in combination with a slide valve and equalizing recesses or pockets, substantially such as described, apertures through the valve itself, which, at the proper time, make a connexion, substantially as specified, between a passage for steam or exhaust and a recess or pocket, for the purpose specified.

No. 37,803.—FREDERICK BENNETT, of Bagillt, Flint county, England.—*Improvement in the Manufacture of Zinc.*—Patent dated March 3, 1863.—The process is as follows: Calcine the zinc ore, mix it with coal or coke, etc., add chlorine in some shape as common salt for instance. Then condense and collect. The proportion of common salt may average 10 per cent.

Claim.—The use or employment of a chloride or compound of chlorine in the manufacture of zinc, by mixing it with the calcine ore and with the carbonaceous matter in the smelting retorts, substantially in the manner set forth.

No. 37,804.—JOHN T. BEVER and MARIA L. BEVER, of Springfield, Sangamon county, Ill.—*Improved Ironing Stand*.—Patent dated March 3, 1863.—The invention consists in the construction and adjustment of the several parts, whereby it may be made to serve the purpose of receptacle for clothing, seat or lounge, ironing table, and rack for drying clothes.

Claim.—The combination of leaf F with the frame D D and slides H H, poles J, and cords K, when arranged with the receptacle for clothing or mattress, substantially as and for the purposes set forth.

No. 37,805.—GEORGE S. BISHOP, of Washington, D. C.—*Improvement in Car Coupling*.—Patent dated March 3, 1863.—The invention consists in the peculiar construction of the coupling latch, in combination with the link to connect the cars.

Claim.—First, the construction of the latch or coupler A, with its foot E, spur D, and wide arm B, in the manner and for the purpose herein set forth.

Second, the stirrup F and step K, in combination with the latch A, with its foot E and spur D, as and for the purpose herein described.

No. 37,806.—HOBERT HENRY BISHOP, of Bristol, Conn.—*Improvement in Device for Converting Motion*.—Patent dated March 3, 1863.—This invention consists in the arrangement of a treadle with two hooked parallel arms, in combination with two pulleys provided with tangential driving arms, and set to turn the fly-wheel in the same direction in such a manner that by the action of the oscillating treadle on the two pulleys, a positive continuous motion of the fly-wheel is produced.

Claim.—The combination with the fly-wheel and its hub *b*, made as represented, of the two arms *e e* of unequal length, the two pulleys D D' of unequal interior diameters, the cords *h h*, and the hook-armed treadle E, the whole constructed and operating in the manner herein shown and described.

No. 37,807.—EDWARD BRADY, of Philadelphia, Pa.—*Improved Means of Affixing Defensive Armor Plates*.—Patent dated March 3, 1863.—The invention consists in attaching metallic plates edgewise to vessels by means of bolts, &c., which enter holes in the inside of said plates, and are enlarged inwardly or intersected by transverse apertures in any way.

Claim.—First, protecting the sides, decks, or other parts of vessels or fortification with metallic plates secured edgewise thereto by means substantially as herein shown and described.

Second, securing the said plates by means of bolts or other fastenings applied to or within apertures or cavities formed in the inner edges of the said plates, and enlarged within the body thereof or intersected by transverse apertures in any way, substantially as explained.

No. 37,808.—WILLIAM H. BROWN, of Erie, Pa.—*Improvement in Dumping Tubs*.—Patent dated March 3, 1863.—The invention consists in adjusting the point of suspension, relatively to the centres of gravity, in such a manner that the tub will be top up when empty, and will be reversed when filled, subject to the condition in this latter case of being restrained.

The skip is pivoted to arms suspended from a cross-bar, and retained in position or restrained from dumping by a vibrating bar which is hung on pivot bolts, so that the part passing round the back of the tub preponderates over the forward part and rests upon brackets. The anterior ends of the bar carry segments, notches in which receive pins secured to the arms by which the skip is suspended; by raising the rear end of the bar the detent is released, and the skip discharged, returning to its position by the counterbalancing weight of the rear portion when empty.

Claim.—The skip or tub balanced and restrained, substantially as described, and dumped when required, in the manner and for the purpose specified.

No. 37,809.—J. WINSLOW CHAPMAN and WM. Z. W. CHAPMAN, of New York, N. Y.—*Improvement in Setting Artificial Teeth*.—Patent dated March 3, 1863.—The invention consists in constructing a plate which on its one side is formed by a cast from the gums, and the other side fitted to the base of the teeth, which are carefully fitted, one by one, on a base of wax so as to articulate with the corresponding teeth in the lower jaw; the outline of base thus obtained is made the mould for a permanent plate, the other side having been fitted to the gums; the teeth are then attached by screws through the plate to platina dies in the teeth.

Claim.—The construction and employment of a plate of metal or other suitable substance, as herein described, between the teeth and the gums, in the manner and for the purposes set forth, detached from and independent of said teeth, said plate conforming to the irregularities of the base of the teeth and the surface of the gums, substantially as herein specified.

Also, uniting the base or saddle plate with the teeth, as and for the purposes set forth, so that said plate and teeth can be readily separated for repairs or otherwise, as herein described.

No. 37,810.—WILLIAM A. DAVIS, of Salem, Columbiana county, Ohio.—*Improvement in Wool-packing Device*.—Patent dated March 3, 1863.—The table consists of a middle and side pieces, upon which the fleece is spread out, with the slotted strap underneath it occupying the central portion. The cords are passed through holes and then to the roller, where they are secured to spikes. By a treadle the side pieces are raised and the wool lapped over on to the centre; the free end of the strap is then doubled back and attached to the roller which is turned, compressing the wool into a roll to be tied.

Claim.—First, the hinged side pieces E E of the platform D, provided with the bars F, and used in connexion with the bars G G', or their equivalents, to serve as stops for the bars F, to retain the side pieces in a vertical position, as set forth.

Second, the arrangement of the bars G G', connecting rod H, spring i, rod I, crank shaft J, and levers h J', substantially as shown, for the purpose of raising the side pieces E E to a vertical position, and releasing the same so that they may be turned down to a horizontal position as herein described.

Third, the cords b placed on the spools a, in connexion with the spikes or teeth t, when said parts are used in connexion with the slotted packing strap P, as and for the purpose specified.

Fourth, the packing strap P attached at one end of the platform D, in combination with the roller K and bearing plate O, as and for the purpose herein set forth.

No. 37,811.—TIMOTHY DRAKE, of Windsor, Conn.—*Improvement in Vapor Lamps.*—Patent dated March 3, 1863.—This is an arrangement by which the heat of the flame is transmitted to the fluid so as to generate gas to be ignited at the orifice of the burner, and consists of a pair of semicircular pallets which receive the heat of the flame and transmit it by rods down to the fluid in the generating chamber, which is separated by a diaphragm from the gas-collecting chamber, the latter communicating with the orifice of the burner.

The upper part is detachable from the lower tube.

Claim.—The combination of the heaters m n, chamber k, diaphragm h, and vaporizing chamber a, substantially in the manner as and for the purpose described.

Also, the heaters m n, with the interior perforated diaphragm h, substantially in the manner and for the purpose described.

No. 37,812.—HENRY J. HALE and HENRY J. HALE, jr., of Indianapolis, Ind.—*Improved Dovetailing Machine.*—Patent dated March 3, 1863.—The lumber to be operated upon is fastened to a bench with the necessary adjustments and motions. It is there operated upon by two chisels whose stocks move up and down in ways or guides which are adjustable so as to regulate the angularity of the sides of the dovetail slot. The two chisel stocks are attached to a walking beam, and a crank from a motor rocks the beam and drives the chisels, the depth of their cut being adjusted by attaching the connecting rod nearer to or further from the centre of vibration of the walking beam.

Claim.—First, the arrangement of the vertical or oblique cutters l l, the walking beam C, having the slot e and the pitman K, by which the depth of the cut is regulated, in the manner described.

Second, controlling the direction of the cutters l l by means of the adjustable grooved plates f f, constructed and arranged with reference to the slides k k, substantially as described.

No. 37,813.—GEORGE ENGLE, of Bunker Hill, Grant county, Wis.—*Improvement in Harvesters.*—Patent dated March 3, 1863.—These improvements mainly relate to the frame of the machine, which consists of a truss or braced frame tightened by a suspending and adjusting screw, and with angular suspension rods for the cutter bar, braces, bars and rods, to stiffen the truss and its outlying parts and afford points of attachment for the working parts, and for the seats of the driver and raker.

Claim.—First, the truss or suspension draught frame, for a reaper or mower, constructed substantially as set forth.

Second, the arrangement of the driver's and the raker's seats in the relation to each other shown, and with respect to the platform and the tongue of the machine, and upon the truss frame and standards G G', substantially in the manner described.

Third, the combination of the angular bracket P, or its equivalent, and the hangers M M, applied and operating substantially as described.

Fourth, the suspending and adjusting screw Q, applied and operating substantially as described.

Fifth, the combination cable k2, and the arms i i, and bracket P, substantially as and for the purpose set forth.

Sixth, the hangers M M, when used as guides for loops of the arms i i, substantially as described.

Seventh, the arrangement of the bar N, with respect to the main frame and gearing, substantially as set forth.

Eighth, the adjustable skeleton triangle divider, made in one piece, in combination with the deflecting board Y, as set forth.

No. 37,814.—R. J. HAMILTON, of Chicago, Ill.—*Improvement in Journal Boxes for Car Wheels.*—Patent dated March 3, 1863.—This invention is an arrangement within the axle-box for preventing the waste of the lubricating oil, and consists of a stationary and fixed collar within the oil-box, and a leather collar around the shoulder of the axle in the neck of the box.

Claim.—The combination and arrangement of the adjustable collar A and the washer C, when cut, as described, and both are operated upon and used with the springs a and c, or their equivalents, and the openings g and f, when all are arranged and operating substantially as and for the purposes delineated and set forth.

No. 37,815.—J. C. G. HOWITZ, of Copenhagen, kingdom of Denmark.—*Improved Composition for Purifying Gas.*—Patent dated March 3, 1863.—The invention consists in the use, for the purpose of purifying gas, of iron ore and spent-tan or saw-dust, by which the combinations of sulphur with carbonic acid and carbonic oxyd and other impurities are absorbed, the oxyd of iron converted into sulphuret of iron, cyanide of iron, carburets of iron, &c.

Claim.—The employment or use of the within described composition of iron ore and spent-tan or saw-dust, mixed together in about the proportion herein specified, for the purpose of purifying coal gas substantially in the manner set forth.

No. 37,816.—HUTSON E. HUGHES, of Cincinnati, Ohio.—*Improved Machine for Sawing Bevels.*—Patent dated March 3, 1863.—This is a circular saw which rotates through a slit in the table. The arbor on which it runs has two points of support—one near the head of the mandril and pivoted, and the other adjustable in a quadrant, so as to bring the circular saw to a greater or less angle to the plane of the table, and consequently to vary the bevel of its cut in lumber exposed to it.

Claim.—First, the arrangement of the movable arbor frame H, supported in bearings at one end and adjustable at the other, in the manner and for the purpose set forth.

Second, the movable table B, with the bevelled slot L, when it has a transverse motion in relation to the saw, for the purpose herein described.

Third, the combination of the movable arbor frame H, with the quadrant I and transverse moving table B, vertical sliding frame D, substantially as and for the purpose set forth.

No. 37,817.—JOHN F. H. KING, of Richmond, N. Y.—*Improved Marine Battery Rams.*—Patent dated March 3, 1863.—A rod projects from the submerged prow of the vessel so as to strike a vessel below the water line. This rod or ram has a reciprocating motion, being connected to a crank and fly-wheel.

Claim.—The use of a submerged thrusting or striking bolt or ram for penetrating the bottom or sides of a vessel of an enemy, when actuated and receiving its reciprocating motion, substantially as and for the purposes described.

No. 37,818.—C. W. THEODORE KRAUSCH, of Chicago, Ill.—*Improvement in Machine for Moving Railroad Cars.*—Patent dated March 3, 1863.—This machine is intended to increase the traction of a hand car upon the rails so as to enable the operators to move cars by the revolution of the winch and gearing applied by an endless chain to the axis of the two wheels which support it under pressure derived from the end being set under the car, the weight of the operators acting as on a lever to press the wheels upon the track as they stand upon the suspended platform. The wheels are made to run free upon the axle when desired to use it as a barrow.

Claim.—First, a lever-traction truck, substantially as described, and for the purpose set forth.

Second, the providing of a truck which has two wheels, with the suspended platform and the jaws *d d*, or their equivalents, substantially as described.

Third, the providing of a truck which has two wheels and a lever frame, with gearing as described, for the purpose set forth.

Fourth, tongued washers in combination with the grooves in the wheels of a truck operating as described, for the purpose set forth.

No. 37,819.—IRA LYNDE, of Marathon, Cortland county, N. Y.—*Improved Clothes Dryer.*—Patent dated March 3, 1863.—This clothes dryer consists of a frame with lines stretched from the projecting arms, and made to traverse by wheels on a grooved track so that the frame may be hung with clothes and then run out of doors upon the extension track for exposure to the air.

Claim.—The arrangement of the wheeled line-carrying clothes frame C (one or more,) in combination with the sectional grooved elevated track A A', constructed and operating in the manner and for the purpose herein shown and described.

No. 37,820.—JOHN MCCLELLAND, of Washington, D. C.—*Improvement in Hydrants.*—Patent dated March 3, 1863.—On the inside of a cap or cover of a hydrant or fire-plug is a pivoted arm on which is a valve sliding in a guide so as to close or open the orifice of the water-main for the attachment of the hose. It is operated from the exterior by a cross handle rotating a crank whose pin works in a slot in the pivoted arm.

Claim.—The sliding valve C, with its slotted arm F, and the crank or eccentric D, with the cap or cover of a hydrant or fire-plug, in the manner herein described for the purpose set forth.

No. 37,821.—JOSEPH A. MONTGOMERY, of Columbus, Ohio.—*Improved Machine for Cutting Square Threads of Wood Screws.*—Patent dated March 3, 1863.—The wooden screw blank being chucked in the lathe, it is submitted to the action of the tools, which are three, and all mounted on one slide rest which has a longitudinal and a transverse motion. The tool in front is a turning-off bit, and as it is advanced to the blank the others recede in the rear. When the blank is dressed off the transverse slide is brought forward and the rotary square

faced cutter tool is presented to the blank having its plane of rotation parallel to the pitch of the screw to be cut. A V-shaped cutter on a stock hinged to the slide-rest is brought into action when a V-threaded screw is required, which pares off the angle of the square thread.

Claim.—First, cutting screw threads with vertical or square edges on wooden blanks by means of a rotary tool.

Second, the combination of a rotary and hinged tool on the one stock or slide-rest, substantially as described and for the purpose set forth.

Third, the construction of the periphery of the rotary tool substantially as described.

Fourth, the combination of the rotary tool, hinged adjustable V-shaped tool, and the turning-off bit or tool, with the slide rest, substantially as described.

Fifth, setting the shaft of the rotary tool oblique with respect to the centres of the lathe, substantially as set forth.

Sixth, the combination of the two driving belt pulleys or drums with the tools for turning off the bench screw blank, cutting V-threads on the same, or for cutting the square or perpendicular edged screw threads, substantially as and for the purpose set forth.

No. 37,822.—JOHN NEUMANN, New York, N. Y.—*Improvement in Pressing and Polishing Metal Vessels.*—Patent dated March 3, 1863.—The vessel is mounted on a mandrel in a lathe, and a tool consisting of a lever and a hard metal polishing roller is pressed against it by being rested on a slide-rest as a fulcrum, and by the motion of the latter fed along the whole length of the vessel to be polished.

Claim.—The employment or use, in combination with a lathe and mandrel, of a lever C, provided with a steel or other hard metal roller P, applied to a slide-rest, or other equivalent feed mechanism, in such a manner that the latter will properly feed the lever and roller along while the same is pressed against the vessel G on the mandrel, and also serve as a bearing or fulcrum for the lever, substantially as and for the purpose herein set forth.

No. 37,823.—BENJAMIN O. PAIGE, Lowell, Mass.—*Improved Stop Motion for Drawing Heads.*—Patent dated March 3, 1863.—A tripper revolves with the upper roller, and should the sliver break or become so diminished as to let the upper down to the lower roller, a projection on the roller trips the lever catch out of the notch in the slide rod, the consequence of which will be a stoppage of the railway drawing head and the carding mechanism connected with it.

Claim.—An improved or positive stop motion or mechanism, the same consisting of the tripper A, or its mechanical equivalent, combined with a lever latch z, and so applied to the upper calender roller as to revolve with it or be revolved by its shaft, and be thereby caused to operate in manner and under circumstances substantially as hereinbefore specified.

No. 37,824.—HERMANN G. C. PAULSEN, of New York, N. Y.—*Improvement in Refining Sugar.*—Patent dated March 3, 1863.—The improvement consists in passing through the mass of sugar an alcoholic vapor at a low temperature to leach or drain out the sirup suspended by capillary attraction among the crystals of sugar. This is done by the suction of an air-pump connected to the lowest part of the refining vessel, together with a surface condenser and receiver. The contents of the vessel being cooled to 90° or 100° Fah., the mother liquor is blown out by a blast of air, communication closed, and the vessel exhausted of air by the other air-pumps; the vapor at a temperature of 100° to 150° Fah. is then admitted from the vessel where it is heated, and drawn through the mass of sugar.

Claim.—The application of alcoholic vapors of the temperature and for the purpose as herein stated to refine crystallized sugar.

No. 37,825.—JOHN HERMANN RUDOLPH REFFELT, of Hoboken, N. J.—*Improvement in Numeral Frames.*—Patent dated March 3, 1863.—The various wires are occupied by balls of lengths proportionate to their relative value as numerals on that board. This may be a regular arithmetical series, as 1, 2, 3, &c., or decimal, as 1, 10, 100, &c., or fractional, as 1, $\frac{1}{2}$, $\frac{1}{3}$, &c., to be used in teaching notation and in performing arithmetical processes.

Claim.—The division of the balls used into sections of compartments denoting units, tens, hundreds, and thousands, (or any denominations desired,) and the use of sliding pieces of various proportionate lengths, to denote fractions.

No. 37,826.—ANDREW J. REYNOLDS, Dayton, Ohio.—*Improvement in Pumps.*—Patent dated March 3, 1863.—In this pump the piston or plunger is hollow, and by a recurved neck discharges the water; the piston works in a double-acting pump chamber beneath the level of the water, and it has two openings, one above, and the other with a gravitating valve on its lower end, so as to admit water at each stroke, the chamber in which it works having two valves, one of which admits water at each motion of the reciprocating piston. The piston rod is suspended by a collar on the ends of two bolts which pass through the arms of the bell crank in which the oscillating lever or pump handle is socketed.

Claim.—First, the hollow piston D D' E F f, containing the double-acting disk valve C'', within the said piston; the whole being constructed and operating, in connexion with a double-acting pump cylinder, or its equivalent, substantially as set forth.

Second, the arrangement of bolts N N', serving the twofold purpose of pivots and set screws, the collar O, bell crank K L M M, and pedestal H I I, the whole being combined with and serving to operate a water-discharging piston rod D', in the manner set forth.

No. 37,827.—GEORGE P. ROBERTS, of St. Louis, Mo.—*Improved Box Machines*.—Patent dated March 3, 1863.—On the horizontal bench is a vertical back board and two stocks, which latter are made adjustable relatively to each other by set screws projecting into holes in the bench. A plate is affixed to the back board having slots, through which project spring clamps, which slide by sleeves upon arbors behind the back board and are thus held against the stocks. The side or end pieces of the box being set up, are held for nailing between these clamps and their respective stocks.

Claim.—First, the employment of the adjustable gauge stocks C, in combination with the plate B, all being constructed and arranged to operate substantially as and for the purposes set forth.

Second, the spring clamps *g*, constructed and arranged to operate substantially as herein described in combination with the stocks C, as and for the purposes set forth.

No. 37,828.—WM. S. SAMPSON, of New York, N. Y.—*Improvement in Conduit Pipes*.—Patent dated March 3, 1863.—The tube is formed of annular sections, which are made of bricks having on their respective faces a tongue and a groove to fit one within the other and avoid lateral displacement. The annular sections are attached and retained by iron rods and annular plates which strain the sections together; the iron exposed is covered by cement.

Claim.—Forming tubes or cylinders for water pipes, cisterns, &c., of tongued and grooved (or otherwise equivalent-shaped) bricks and iron bond-plates and tie-rods, in combination with a composition or cement lining covering the iron-work, substantially as and for the purposes herein before set forth.

No. 37,829.—GEORGE W. SAYRE, of Pisgah, Butler county, Ohio.—*Improvement in Grading and Dressing Roads*.—Patent dated March 3, 1863.—The invention consists of a scraper suspended by a frame from the hounds and axles of a wagon, and operating for the width of the wagon track to level the ground, being advanced obliquely so as to throw the ground to the off side, and returning, raise the ground in the middle of the road. A plough in front of the scraper is used when desired to make a track for a water-course or ditch.

Claim.—First, the combination of the scraper A with beam C, angle brace *d*, hinged brace E, and levers G G'.

Second, the plough P, in combination with scraper A, when constructed as and for the described purposes.

Third, the above-described machine when combined, arranged, and constructed as and for the purposes set forth.

No. 37,830.—JOHN J. SCHILLINGER, of Washington, D. C.—*Improvement in Percussion Apparatus for Explosive Shells*.—Patent dated March 3, 1863.—This shell is divided into two chambers by a partition which contains a cap tube. The forward end contains the explosive charge, and the rear chamber a plunger for exploding the cap on the impingement of the shell against the object. This plunger is attached to the base of the projectile by a combustible cord.

Claim.—First, dividing the interior space of a shell or the hollow part of projectile into two separate chambers, one containing the charge of powder, the other containing a plunger, when the said plunger is secured to the shell as hereinbefore specified.

Second, fastening the said plunger to the end or rear part of the shell or projectile by means of a combustible cord, in the manner and for the purpose substantially as herein described.

No. 37,831.—WM. SPALDING, of Port Clinton, Ottawa county, Ohio.—*Improvement in Grading Machines*.—Patent dated March 3, 1863.—This scraper is to be attached underneath a farm or log wagon, being suspended by a chain from the frame and a bolt from the axle, and drawn by bolts attached to eye-bolts beneath the axles. The scraper is raised and lowered and its inclination adjusted by a lever chain and segment rack and by a screw-nut on the hind axle from which the rear of the scraper is suspended.

Claim.—First, the arrangement of rods *a a b b*, in combination with staples or eye-bolts *c d*, for attaching a plough and scraper combined, as described, to the axles of an ordinary farm or lumber wagon, thereby adapting said wagon to use as a grading machine as specified.

Second, the pivoted lever H, segment rack I, and chain *e*, in combination with the eye-bolts *c d G*, rods *b b*, and screw-winch or lever-nut J, for raising and lowering or adjusting the inclination of the plough and scraper combined, when connected with a wagon in the manner substantially as described.

No. 37,832.—JOHN J. SQUIRE, of New Haven, Conn.—*Improved Register for Gas and Water Meters*.—Patent dated March 3, 1863.—The invention consists in combining cams and levers with the ordinary toothed-wheels or movements whereby the figures indicating the measurement are exposed at orifices in the face plate which are in front of each dial, the action of the shields, which are operated by the levers and cams, being to hide the receding figure and prevent confusion.

Claim.—The above-described arrangement of the cams, levers, and shields when applied to gas or water meters as and for the purpose herein set forth.

No. 37,833.—JOHN TEMPLE, WM. M. MILLS, and ATLAS L. STOUT, of Middletown, Butler county, Ohio.—*Improvement in Water Wheels*.—Patent dated March 3, 1863.—The upper annular rim has a curved lower face, and the lower rim an inclined upper face, between which the buckets of scroll shape are placed, having a centre discharge.

Claim.—The combination of the curved or concave top flange or rim A with the inclined straight flange or rim B, constructed and operating in the manner and for the purposes substantially as described.

Also, the combination of the flanges or rims A B, constructed as set forth, with cyma-reversa or scroll buckets c, in the manner and substantially as specified.

No. 37,834.—WILLIAM S. TODD, of Mechanicsville, Cedar county, Iowa.—*Improvement in Corn-Planters*.—Patent dated March 3, 1863.—The frame of the planter is supported on wheels which are journaled in hinged frames. One wheel follows each seed box, which discharges its seed in the groove left by a share or rod.

Claim.—The arrangement of the secondary hinged frames H forming the bearings for the axles of the wheels G, in combination with the main frame A and the driver's seat F, all constructed and operating substantially as and for the purposes shown and described.

No. 37,835.—WILLIAM G. TUTTLE, of Geneva, N. Y.—*Improvement in Saws*.—Patent dated March 3, 1863.—The teeth are alternately a double cutting tooth and a straight clearing tooth, the face of the latter being hollowed so as to present a cutting corner sharper than a straight rectangular dress.

Claim.—The employment of alternate clearing teeth *d d*, the ends of which are concave or notched, so as to form sharp or pointed corners, in combination with the triangular pairs of cutting teeth *a a'* arranged on a single saw blade, substantially as and for the purposes herein set forth.

No. 38,836.—MAXIMILIAN WAPPICH, of Sacramento, Cal.—*Improved Defensive Armor Plates*.—Patent dated March 3, 1863.—The improvement consists in the manner of forming the plate and the fitting, strengthening and adapting it to varied positions and circumstances. It consists generally of a plate with a fair exterior face, with projections which pass through the wooden casing and inner plate and are there keyed. It has also flanges or bent ends having notches in their edges, and bracing plates extending from its inner surface to the inner plating of the vessel, to which the armor is further secured by bolts, which, keyed on the inner side of the plating, are fastened to projecting lugs on the inside of the armor. The port-hole is secured by a square frame, which occupies the space between the armor and inner plating and a plate which supports it inside. Rebates on the inner edges of contiguous plates are filled with break-joint strips.

Claim.—First, armor plates having projections *f* to pass through the side of the vessel, substantially as and for the purpose described.

Second, the projection *k*, which is formed on the inside of the flanged armor plate to clasp the head of the bolt *l*, in combination with the bolt *l* when fastened with key *h*, in the manner and for the purpose substantially as described.

Third, the combination of the bent ends and angular projections and notches *m m* with the flanged armor plates, substantially as and for the purpose described.

Fourth, applying to the side of the vessel and behind the armor plates backing ribs *d d* in an edgewise position, substantially as and for the purpose described.

Fifth, securing the port-hole by a united ring *r*, inside frame *o*, and flanged armor plates, combined substantially as and for the purpose described.

Sixth, providing the adjoining edges of the flanged armor plate with grooves or recesses *w*, in the manner and for the purpose set forth.

No. 37,837.—W. POWELL WARE, of New York, N. Y.—*Improvement in Mica Lamp Chimneys*.—Patent dated March 3, 1863.—The frame of the chimney is formed of angular metallic plates within rebates, in which the flat panes of mica are secured.

Claim.—A mica lamp chimney formed of a frame constructed in such a manner as to admit of the insertion of flat slabs or panes of mica, substantially as herein set forth.

No. 37,838.—JOHN WARNCKE, of Buffalo, N. Y.—*Improved Composition for Restoring Colors to Cloth, &c.*—Patent dated March 3, 1863.—Composition: Two gallons rain water, two ounces ammonia, two and a half ounces cochineal, one ounce cudbar, half an ounce English tin, one-quarter of an ounce spirits of salt, one-quarter of an ounce alcohol. Mix; apply warm with a stiff brush, thoroughly saturating the cloth.

Claim.—The composition of matter herein described and the mode of applying it, for restoring colors to faded and soiled cloth, substantially as herein set forth.

No. 37,839.—ELI K. WISELL, of Warren, Trumbull county, Ohio.—*Improved Spoke Machine*.—Patent dated March 3, 1863.—Upon the frame of the machine posts are erected which support the traverse rod, and on this the traverse rest moves, carrying two head blocks, each with two sets of mandrels for the securing of the pattern and the spoke, which are passed

the length of the traverse track in contact with a revolving cutter, and then automatically rotate the spoke and pattern simultaneously a part of a revolution by means of an inclined plane, pawl, and ratchet, and thus proceeds till the whole surface of the spoke has been turned off in accordance with the pattern by a series of longitudinal movements. When the spoke and pattern, whose mandrels are geared together, have performed their full revolution, the traverse frame is thrown out of gear and the spoke dropped.

Claim.—First, cutting the spokes in longitudinal sections by means of a revolving cutter and a traversing motion of the spoke and pattern, and the rotation of the spoke and pattern by sections in concert with each other, in the manner specified.

Second, the roller K, upon which the pattern rests, for the purpose specified.

Third, the inclined planes J J, in combination with the pawl and ratchet I I', when arranged and operating as and for the purpose specified.

Fourth, the finger P and rod T, when arranged and operated as described, for throwing the traverse frame out of gear.

Fifth, the traverse frame D and mandrels F F' and G G', in combination with the revolving cutters, arranged and operating as set forth.

No. 37,840.—JACOB WOLF, of Fort Madison, Gee county, Iowa.—*Improvement in Razor Straps.*—Patent dated March 3, 1863.—This improvement consists in substituting a plate of polished zinc for leather on one side of a razor strap, to be used dry or wet. The razor to be moved edge forward in the act of sharpening.

Claim.—A razor strap, provided with a surface of polished zinc, as and for the purpose herein shown and described.

No. 37,841.—SOLOMON S. MECAY, of Kilbourne, Delaware county, Ohio, assignor to SPENSER MECAY, of same place.—*Improvement in Rotary Steam Engines.*—Patent dated March 3, 1863.—Between two disks are certain convoluted plates whose form may be seen in the illustration. At the centre, through the hollow axle, steam is admitted, and its points of egress are at the narrow ports between the plates driving the wheel, partly by impingement of the steam on the atmosphere, and partly by the non-equilibrium of the wheel.

Claim.—Constructing the drum or propelling cylinder of a rotary, steam, or other motor with segmental rims D D D D, having hooked or bent ends E E E E, so combined and arranged together as to form short compressing channels F F F F, and exhaust outlets G G G G, disconnected and remote from the ports B B, and whereby is acquired an enlarged area of capacity, and an accumulating chamber I I I I, thereby affording an increased volume of steam and also avoiding friction, substantially as set forth, shown, and described.

No. 37,842.—H. M. PRESTON, of St. Louis, Mo., assignor to A. H. BAKER, of same place.—*Improved Machine for Tenoning Spokes.*—Patent dated March 3, 1863.—This invention consists in the construction and operation of a cam upon the revolving cylinder so that the cutter shall receive a lateral as well as a rotary motion, to impart an oval shape to the tenon of the spoke.

Claim.—The employment of the cam F, arranged upon the cylinder E, or its equivalent in effect, in such manner as to impart to the cutter a reciprocating motion, in combination with its rotary motion, for the purpose of forming oval or flattened tenons for spokes of wheels, substantially as herein set forth and represented.

No. 37,843.—JACOB DUNTON, of Philadelphia, Penn.—*Improved Can or Flask.*—Patent dated March 3, 1863.—The bottle is covered with a casing of wood, and an outer shell of metal and the projecting neck of the bottle is protected by a flange or shelf which rises from the top of the flask.

Claim.—The combination of an outer casing C of sheet metal and interposed body B B', of cork, wood or analogous material, with a flask or bottle A A', in manner herein described and for the purposes set forth.

Also, the guard D applied to the outer casing C, to protect the neck of the bottle or flask in the manner explained.

No. 37,844.—JACOB DUNTON, of Philadelphia, Pa.—*Improved Pack-Saddle.*—Patent dated March 3, 1863.—Pivoted to the saddle is a transverse beam, from the ends of which the load is suspended. The load is held against the sides of the animal and steadied by guys from the pommel and cantle.

Claim.—First, the application of a pivoted beam to a bearing saddle, substantially as and for the purposes set forth.

Second, a pack-saddle provided with a beam or beams, constructed substantially as described, and adapted for the suspension of burdens from adjustable points, in the manner and for the purposes herein set forth.

No. 37,845.—WILLARD H. SMITH, of New York, N. Y.—*Improved Perforations in Lamp Burners.*—Patent dated March 3, 1863.—The improvement consists in making the perfora-

tions through the lamp burner with a raised rim, on which the chimney rests, so that a current of cold air shall circulate beneath the flange of the chimney and prevent the conduction of heat from the chimney to the burner.

Claim.—A raised perforation, as shown at *c*, in Fig. 2 and Fig. 3, when used in coal-oil and other burners, the whole being arranged substantially as and for the herein-described purposes.

No. 37,846.—STEPHEN M. ALLEN, of Woburn, Mass.—*Improvement in Reducing Long-staple Fibre.*—Patent dated March 10, 1863.—Fibres of flax, hemp, jute, and like materials, are subjected to the air and vapor process as patented by the same inventor the 20th of March, 1860, and then steeped in warm water and an alkaline solution, and alternately washed and rinsed and then boiled and bleached. The fibres, as thus prepared, are then drawn down by rollers until they are fully stretched, when the fibre is ready to be spun into yarn, or for other purposes.

Claim.—First, the process of treating long-stapled fibre for the purpose of converting the same into a short-stapled fibre by the application to the fibre to be reduced of successive washings in warm water, increasing in temperature as herein described, in combination with the use of alkaline solution, substantially in the manner and for the purposes hereinbefore set forth.

Second, in combination with the treatment of long-stapled fibre by successive washings in warm water and subsequent boiling, the method of reducing the same mechanically, in the manner and purpose herein described.

No. 37,847.—EVANS BACKUS, of Coxsackie, Green county, N. Y.—*Improvement in Stoves.*—Patent dated March 10, 1863.—The application of the panes of mica in the construction of this stove is such that the fire may be exposed or not by the rotation of an inner movable band or rim, so as in the act of kindling fires to prevent the mica from being rendered opaque and worthless by the smoke.

Claim.—The insertion of mica *i* in a movable band or rim *K*, or in an equivalent slide, arranged in relation with the openings *d* in the cylinder *E*, or body of the stove, for the purpose set forth.

No. 37,848.—FRIEDRIK BECKER, of Scranton, Luzerne county, Pa.—*Improved Composition for Lining Oil Barrels, etc.*—Patent dated March 10, 1863.—The composition is as follows: Boil one pound of glue in a quart of water, then add one quart plaster of paris, two ounces rosin, one ounce turpentine, four ounces sulphur, one ounce shellac; mix and boil thoroughly; apply hot.

Claim.—The application of the above-mentioned composition, to prevent barrels, boxes, &c., from leaking, even kerosene oil barrels.

No. 37,849.—FRIEDRIK BECKER, of Scranton, Luzerne county, Pa.—*Improvement in Securing Shutters and Show-Windows.*—Patent dated March 10, 1863.—The invention consists in an arrangement for locking and unlocking simultaneously all the catches of a peculiar construction which fasten a window or shutter by devices located inside. This is accomplished by attaching the handle or salient part of each catch to a common chain or connecting links, which cause them to move together.

Claim.—The mode of securing the shutters by means of the peculiar constructed catches *C*, governed by the apparatus as above described and shown in the drawings.

No. 37,850.—LEWIS G. BRADFORD and CHARLES O. CHURCHILL, of Plymouth, Mass.—*Improvement in Machines for Leathering Tacks.*—Patent dated March 10, 1863.—This invention consists in the application of a stop motion to the tack separator, so as to arrest the motion of the latter in case of obstruction in the arrangement of the grippers which hold the tacks perpendicularly while being driven through the leather; also in an arrangement of parts for cutting the washers.

Claim.—First, the application of the regulator or stop motion *M*, by the action of which any obstruction to the free movement of the horizontal reciprocating separator *K* is detected and the motion of the separator stopped.

Second, the combination and arrangement of the tack guide substantially as described, by which the tack is taken from the separator and held in a perpendicular position (causing each tack to be centred alike) while being driven through the leather, and a uniform appearance of the washers insured.

Third, the combination with the bottom of the piston *G* of the plate *p* and elastic piece *q*, the whole being arranged to operate in connexion with the stationary circular cutter *R* in a tack-leathering machine, as and for the purposes set forth.

No. 37,851.—CLARISSA BRITAIN, St. Joseph, Berrien county, Michigan.—*Improvement in Floor-Warmers.*—Patent dated March 10, 1863.—This invention consists in the application of a reflector to the bottom of a stove in such a manner that the heat is reflected on the floor beyond the stove.

Claim.—The application to the bottom of a stove of a reflector A, constructed and operating in the manner and for the purpose specified.

No. 37,852.—H. M. and W. W. BURSON, of Atkinson, Henry county, Illinois.—*Improvement in Binding Attachment to Harvesters.*—Patent dated March 10, 1863.—In operating, the handle O is raised, elevating the arm and depressing the rear extension which carries the reel, and paying off the twine until it reaches the ratchet M; the gavel being then shoved to the binder and the arm brought down, the ratchet L drawing on the wire gives it the required tension and the ends are fastened.

Claim.—First, the combination of the arm C, fore-arm C', handle piece D, lever E, with groove g, acting substantially as and for the purpose set forth.

Second, the combination of the ratchet pulley N with the spring ratchets L and M, acting substantially as described.

Third, extending the arm C back of its bearing a, and placing thereon the reel G and pulley k, for the purposes herein set forth.

Fourth, the combination of the handle-piece D, slide F, lever E, and cord I, acting substantially as and for the purpose set forth.

No. 37,853.—T. M. CHAPMAN, of Old Town, Penobscot county, Me.—*Improvement in Device for Gumming Saws.*—Patent dated March 10, 1863.—The two levers, which respectively operate the clamp and the die, are pivoted, the lower clamp lever at the end and the upper die lever in the middle; and as they are vibrated by the rotation of the screw, the first movement is to vibrate the lower lever on its centre and bring the clamp down on the saw plate, and when that is in contact, the lower lever becoming a fixture, the upper lever being further vibrated, brings the upper die upon the lower and cuts off the piece of metal.

Claim.—The male die C, clamp I, and female die e, combined and arranged to operate as and for the purpose herein set forth.

Further, the combination of the levers D G, bar H, and screw-rod F, arranged with or applied to the stock A, as a particular means for operating the die C and clamp I, as herein described.

No. 37,854.—ROSWELL F. COOK, of Watertown, Jefferson county, N. Y.—*Improvement in Breech-loading Fire-arms.*—Patent dated March 10, 1863.—This improvement has relation to that class of breech-loading fire-arms in which the breech is exposed by the partial rotation of the chamber relatively to the stock, and the special device refers to the withdrawal of the spent cartridge chamber by the said rotation of the barrel and stock relatively to each other; and relates further to facilities for loading from the magazine below the pintle, or for loading the ordinary way at a point midway between that and the position for firing. By the rotation of the barrel the slide is withdrawn by the vibration of the dog, and a tooth projecting downward from the slide behind the flange of the metallic cartridge withdraws the latter from the chamber.

Claim.—First, the lever k, spring m, slide n, and spring p, the whole applied in combination with each other and with the hooked slide I i, the chamber piece E, or barrel, and the breech B, and operating substantially as and for the purpose herein specified.

Second, in combination with the arrangement of the magazine below the axis about which the barrel and stock move relatively to each other, so constructing the frame A B that at a certain position between that proper for firing and that proper for loading from the magazine, the rear end of the barrel or chamber is exposed in an open condition, thereby providing for loading by hand, or from the magazine, as may be convenient, substantially as herein described.

No. 37,855.—N. B. COOPER, of Gratis, Preble county, Ohio.—*Improvement in Wagon Bodies.*—Patent dated March 10, 1863.—This improvement consists of a frame-work to be placed above the bolsters and between the standards of the wagon, and so constructed with end pieces that it may, by the addition of flaring boards in appropriate grooves, be made to form a rack, or by their being fitted into vertical grooves and a floor laid to form a close body, or by being removed altogether to form a hay ladder, &c., as may be required.

Claim.—The ends of the wagon body, as herein fully set forth and described, in combination with the frame D and the side pieces H and O, as and for the purpose specified.

No. 37,856.—C. DANN, of Rushford, Fillmore county, Minn.—*Improved Jointed Scull Propeller.*—Patent dated March 10, 1863.—This propeller consists of a jointed blade which works in a rectangular tube, and is so arranged as to expel the water by the lifting and depressing motion derived from a rock-shaft through the medium of beams and suspension rods. As the beam rises, being pivoted eccentrically, the forward end (in the case represented) will first rise, then the middle or point, and lastly, the rear end, in each case forcing the water towards the rear, and as the beam descends the same order is observed with the same effect. By shifting the pivot to the other end of the slot in the beam, the action is reversed, the rear end descending first, and the motion of the water changed.

Claim.—First, the arrangement of the jointed blades A A', in combination with the beams C, suspended eccentrically from a pivot c, in the loose ends of oscillating arms D, all constructed and operating substantially as and for the purpose shown and described.

Second, the arrangement of the slots e' in the beams C, in combination with the pivot e on the oscillating arms D, and with the sculling blades A A', constructed and operating substantially in the manner and for the purpose herein specified.

No. 37,857.—JOHN R. DAVIS, of Racine, Wis.—*Improvement in Moulds for Castings.*—Patent dated March 10, 1863.—This improvement consists in making movable legs operated simultaneously to raise the upper flask with the match-board so that it may be drawn from the sand without disturbing the edges of the latter.

Claim.—The application of movable legs H, operated by means of a screw D, and hinged levers F, or their equivalents, in combination with the match-board or pattern A and flask C, substantially as and for the purpose herein shown and described.

No. 37,858 —WILLIAM H. DOANE, of Cincinnati, Ohio.—*Improvement in Saw Stave Jointers.*—Patent dated March 10, 1863.—The stave is fixed by its ends into a carriage, having a bar in the centre to give it the requisite bulge, and operated by a lever rack and cam, which traverses with the carriage. The jointing saws are hung upon mandrels whose pitch is varied by a lever and connexions, which operate a vertically sliding post and connecting rods to the outer end of the mandrel frames.

Claim.—First, springing or bending the stave in the carriage during any stage of its progress between the saws or at any point on the bed plate, by the actuation of simply a lever connected with bending mechanism, and without adjusting the carriage to a certain position relatively to a bending bar, substantially as set forth.

Second, the cam gear and rack, or their equivalents, arranged to move with the carriage, and operating substantially as herein described, for the purpose set forth.

Third, the combination of the curved spring stop, hand lever, sliding rack and bender, substantially as and for the purposes described.

Fourth, adjusting the pitch of the saws by means of a combination of a horizontal axis, with a vertical sliding post, substantially as and for the purpose described.

Fifth, the combination of the horizontal lever, vertical double hinging post and saw arbor frames or yokes, substantially as described.

Sixth, the angular slotted spring lever R, curved stop-plate and vertically acting lever Q, in combination with the double hinging vertical post for maintaining the desired pitch of the saws, substantially as described.

No. 37,859.—JOSEPH M. DRAKE, of Amityville, Suffolk county, N. Y.—*Improved Pulley Block.*—Patent dated March 10, 1863.—The sheave or wheel of this block has its inner face grooved, and runs upon balls around its axis.

Claim.—As an improved article of manufacture, a pulley block made with its wheel B, grooved centrally and provided with balls C, as herein shown and described.

No. 37,860.—T. C. FAULDER, of Albany, N. Y.—*Piano-forte Action.*—Patent dated March 10, 1863.—These improvements consist in the construction and arrangement of the parts involved in the motion work, the hammer-but and jack, with their connecting spring and cord, and the method of cushioning the point of contact of the jack and the but.

Claim.—First, the spring b attached to the jack, and connected with the lower part of the hammer-but, substantially as and for the purpose herein specified.

Second, the regulating screw d, applied in combination with the jack, and with the spring b, substantially as and for the purpose herein specified.

Third, arranging the connexion of the spring b and the hammer-but between the top of the spring and an elongation of the lower portion of the hammer-but, substantially as herein set forth.

Fourth, the second cushion g, applied at the back of the cushion h, within a hole bored for its reception in the hammer-but, as shown in Fig. 2, and herein described, for the purpose set forth.

No. 37,861.—WILLIAM B. FREDERICK, of Pontiac, Mich.—*Improvement in Straw Cutters.*—Patent dated March 10, 1863.—In this machine the knife is obliquely set in a vertically moving gate, which is worked by a treadle; the gate is counterpoised by a weight, and a spring above the weight coming in contact with a bar, helps to start the gate at the commencement of its upward stroke.

Claim.—The arrangement together of the apron f, knife F, gate D, box A, treadle E, weight G', spring J, pulley I, and connecting cord H, all in the manner herein shown and described.

Also, the combination of the weight G with the spring J, for the purpose described.

No. 37,862.—PERRY G. GARDINER, of New York, N. Y.—*Improvement in Railroad Car Springs.*—Patent dated March 10, 1863.—The spring-box is composed of several cylinders, in which are fitted spiral springs, with a filling of compressed wool to add to their rigidity,

The plungers which enter these cylinders have a central plug of wood, and are filled with coils of different lengths, so as to come into action consecutively, and make an increased elastic resistance.

Claim.—First, the manner of applying the wool (or other fibrous materials) within a spiral or circular steel spring, so as to hold the wool in a columnar form and compressed to a sufficient degree of compactness to act as a spring itself, and also to aid and strengthen the spiral spring at the same time and hold it in a straight line.

Second, the peculiar construction of the followers *b' b'*, in being composed of a wooden plug within the hollow cylinder, thereby producing lightness and economy.

Third, in combination with the other parts of the spring, the manner of giving a progressive or increased elastic resistance, according to the increase of the load, by making the columns constituting the springs of different heights, as described.

No. 37,863.—MELVIN A. GENUNG, of Granville, Ohio.—*Improved Door Bells.*—Patent dated March 10, 1863.—The wires from the room are passed through brackets, and have springs attached, which relieve the bell-spring; from the brackets the wires are connected by chains to an arm, on the centre shaft of which a spring is wound, operating the hammer-arm inside the hemispherical bell.

Claim.—The combination of the chain X, brackets D, springs F and G, and supporting hinge S, when all are arranged as and for the purpose specified.

No. 37,864.—HENRY S. GOLIGHTLY and CHARLES S. TWITCHET, of New Haven, Conn.—*Improved Folding Chair.*—Patent dated March 10, 1863.—The back, arms, and front legs are made of continuous curved pieces. The back supports and hind legs are pivoted to the back, and have side-rails which hook over pins on the front piece. The front piece is jointed, and the chair folds so that each piece fits the curve against which it is closed.

Claim.—The combination and arrangement described of the legs A A, back or arms B B, legs C C, and seat bars S, when the same operate to fold and lock in the manner substantially as herein specified.

No. 37,865.—GEORGE W. GRISWOLD, of Logansport, Ind.—*Improvement in Wrenches.*—Patent dated March 10, 1863.—The openings in the flat bar are formed of slots or mortises, larger on one side than on the other; so that, by turning the bar, a greater number of sizes for operating on nuts, burrs, &c., may be obtained.

Claim.—Making the notches or openings of a bar wrench of two sizes or capacities, so that, by turning it over it will present different areas of openings, substantially as herein represented.

No. 37,866.—LIVERAS HALL, of Charlestown, Mass.—*Improved Caoutchouc or India Rubber.*—Patent dated March 10, 1863.—The process consists in immersing the caoutchouc in a mixture composed of chloride sulphur, 1 part; carbon spirits, 40 parts; or the mixture may be spread on.

Claim.—The improved product, manufacture, or composition herein-above explained, it consisting of caoutchouc, as described, combined with or having applied to it the carbon spirits and chloride of sulphur, by means or in manner substantially as specified.

No. 37,867.—CARL A. KLEEMAN, Erfurt, Kingdom of Prussia.—*Improvement in Lamps.*—Patent dated March 3, 1863.—The improvement consists in making a notch at the bottom edge of the inverted cylinder of the fountain supply, so as to admit of a smaller bubble of air entering the cylinder; in making the central tube around which the wick ascends with a spiral depression, so as to increase its rigidity without impairing its lightness; and in arranging a cylinder with a funnel-shaped top around the outside wick-tube to catch and return superfluous oil.

Claim.—The notch *i* in the cylinder *f*, for the purposes and as specified.

Also, the interior air-tube *k* of the burner, formed of thin sheet-metal, with the screw-thread made by bending said sheet-metal, as specified.

Also, the arrangement of the wick-tube *o*, cylinder *p*, and cup 3, at the upper end of said cylinder *p*, to return any overflow of oil to the inside of the cylinder *h*, as specified.

No. 37,868.—C. W. THEODORE KRAUSCH, of Chicago, Ill.—*Improvement in Lamp and Lantern Burners.*—Patent dated March 10, 1863.—This invention consists in enclosing the flame of the wick with a coil of wire, by which it is surrounded with a body of heated air, the smoking of the flame on the moving of the lamp is prevented, and more perfect combustion insured when the flame is low.

Claim.—Heating and supplying air to the flame of a lamp or lantern in a space included within a spiral coil, substantially as and for the purpose described.

No. 37,869.—C. W. THEODORE KRAUSCH, of Chicago, Ill.—*Improvement in Grain Dryers.*—Patent dated March 10, 1863.—This machine consists of a series of devices by which the grain is continuously carried back and forth through a hot-blast or suction currents, and

at intervals agitated and cleaned from dust, then carried to a scourer and subjected to a cooling blast, and finally separated. At the lower part of the machine is a furnace, the heated air from which ascends through a chamber, the sides of which are occupied by a vertical series of agitated wire shoes, and the centre of a vertical series of horizontally-moving endless belts, which carry the grain across the machine from shoe to shoe; from this part of the machine it passes to a scourer, where it is exposed to and cooled by a fan-blast, and at last it is raised by an elevator and discharged on a separating riddle.

Claim.—First, the combination of an agitating, cleaning, and conducting device or devices, with the carrier belt or belts of a grain-dryer, substantially as and for the purpose set forth.

Second, the arrangement of mechanism for vibrating a series of agitating and cleaning sieve shutes, arranged at opposite ends of a series of endless grain-carriers or belts of a grain-dryer, substantially as described.

Third, producing a circulation of air through the chambers of a grain-dryer, and expelling the same therefrom, for the purposes set forth, by means of one or more fans, applied with respect to the endless grain-carriers, the air-heating chambers, and the drying chamber, and operating substantially as described.

Fourth, the arrangement of the fire-furnace, hot-air chambers *e e*, adjustable valve or valves *f f*, and drying chamber B, or their equivalents, substantially as and for the purposes set forth.

Fifth, the valves *j j'*, in combination with the fan cases and the drying chamber and its valves *f f*, substantially as and for the purposes set forth.

Sixth, the air-chambers *k k' l l*, in combination with the fan cases and the drying chamber, substantially as described.

Seventh, the combination of the scourer with the drying apparatus, substantially as described.

Eighth, the combination of the separator with the grain-dryer, substantially as described.

Ninth, an organization, substantially as described, whereby the grain is dried, agitated, dusted, scoured, separated, and cooled, as set forth.

No. 37,870.—PETER B. LAWSON, of Cold Spring, Putnam county, N. Y., and ALFRED BERNEY, of Jersey City, N. J.—*Improvement in Chambered Trunnions for Disabling Ordnance.*—Patent dated March 10, 1863.—The invention consists in making provision for blowing off the trunnions of cannon by a charge chamber with a screw plug in the trunnion.

Claim.—Providing cavities in the trunnions of ordnance for the reception of charges of gunpowder, by the explosion of which the trunnions may be broken off or destroyed, substantially as herein specified.

No. 37,871.—WILLIAM MILLER, of New York, N. Y.—*Improvement in Coal Scuttles.*—Patent dated March 10, 1863.—This sheet-metal coal scuttle has a corrugated wrought-iron bottom.

Claim.—The application of a corrugated cast-iron bottom D to a coal scuttle A, as and for the purpose herein shown and described.

No. 37,872.—DAVID R. PROCTER, of Gloucester, Mass.—*Improved Mast Hoop.*—Patent dated March 10, 1863.—The square ends of the wooden hoop come together and are held closed by a curved strap, whose ends fit in recesses in the hoop. The strap is held to the hoop by bands or sleeves, and a projection on the sleeve affords the means of lashing the leach of the sail to the hoop.

Claim.—A mast hoop having the ends that abut against each other closed and held firmly together by the wedge-shaped brace or tie secured to the hoop by the two iron rings or bands I I'.

Also, in combination with the above, the attached concave piece K, that holds the leach rope and prevents the friction of the opposite side of the hoop upon the mast.

No. 37,873.—WILLIAM RIDONOUR, of Springfield, Ohio.—*Improvement in Hay Presses.*—Patent dated March 10, 1863.—This is a horizontal trunk, in which a follower works under the pressure of a toggle operated by capstan, rope, and pulleys. The discharge is at the end, and the band grooves are in vertical planes as the bale is on its side. The boards which line the passage are attached at their rear end, and loose at their forward end, being confined by cams during the act of pressing, and slackened to loose the bale for its discharge. The vertical sides of the trunk are formed of boards, against which the hay is tramped in charging the press, and which move forward with the follower in the act of pressing, to maintain the lamination of the hay and the shape of the bale.

Claim.—First, the end-discharging horizontal trunk B, made widest horizontally, and having its band grooves in vertical planes longitudinal of said trunk, the whole being combined and operating substantially as set forth.

Second, the end-discharging horizontal trunk B, whose sides *b b'*, toward its discharging end, are disconnected from the frame, and are confined by cams I I' for the pressing of the bale, and are adapted to spread for the release of the bale, substantially as set forth.

Third, constructing the follower of an end-discharging horizontal hay or cotton press with side wings H H', which project forward and embrace the hay or cotton on two opposite sides during the advance of the follower, in the manner set forth.

Fourth, the rear upper door C, hinged at the back, and having the sliding panel c adapted to close the rear end of the trunk until the passage of the follower, as herein explained.

Fifth, the provision, in an end-discharging horizontal press, of an expelling block or blocks X, attachable to the front of the follower and operating as described.

Sixth, the described arrangement of pressing and retracting windlasses N and P, sweep T Q q, gearing S S', treadle P, cords O and K, pulleys L, toggle M, and follower G, as and for the object stated.

No. 37,874.—Suspended.

No. 37,875.—ALEXANDER ROSS, of Brooklyn, N. Y.—*Improvement in Fire-Alarm and Heat-Detectors*.—Patent dated March 10, 1863.—The invention consists in the application of a compound strip of two different metals to complete or close the electric circuit by the increase or decrease of heat, and in combination with a movable index and a scale to close the circuit at any predetermined point or degree of heat, so that the closing will spring an alarm or actuate any suitable device.

Claim.—The combination with the compound strip of an index movable on a scale to complete the circuit at any degree of heat corresponding with the point on the scale at which the index may have been set, and for the purpose described.

No. 37,876.—AMOS W. SANGSTER, of Buffalo, N. Y.—*Improvement in Dies for Turning Flanges*.—Patent dated March 10, 1863.—The object is to bend over to a flat flange, with a smooth edge inside, the swaged groove on the end of the cylinder forming the foot of the lamp. This is accomplished by a pair of dies, one of a cylindrical shape, and the other fitting upon it, and having a descending flange embracing the end of the other die.

Claim.—The dies B and G, constructed and operated as and for the purpose set forth.

No. 37,877.—W. ANTHONY SHAW, of New York, N. Y.—*Improvement in Lining Lead Pipes with Tin*.—Patent dated March 10, 1863.—The cylinder of lead which is forced through the die has an inner cylinder of tin around the core which makes a lining of tin to the lead pipe as it exudes from the die under hydraulic pressure.

Claim.—The manufacture of lead pipe with a lining of tin by forcing an ingot of tin and an ingot of lead while over a core out of a cylinder through a die by hydraulic pressure, as specified.

No. 37,878.—B. T. STOWELL, of Quincy, Ill.—*Improvement in Excavating and Ditching Machines*.—Patent dated March 10, 1863.—This consists of a cutter suspended from a travelling frame which carries an endless apron to remove the dirt raised by the cutter and a transverse endless apron to carry it off for discharging on the bank. The outer end of the transverse carrier is supported by a yoke and wheel.

Claim.—The employment or use of an adjustable yoke M applied to the end of the swinging or adjustable frame L, and provided with a wheel N, in combination with the side cutter B, cutter G, and endless aprons H K, the latter being placed in the swinging or adjustable frames F L, and all arranged substantially as and for the purpose set forth.

No. 37,879.—SAMUEL H. SUGETT, of Eden, Hancock county, Maine.—*Improved Fid*.—Patent dated March 10, 1863.—The fid is made in two parts, and the thimble being placed in the recess on one end the cap is screwed on. The cringle is then pulled over the fid until it falls into the thimble, when the cap is unscrewed and the fid withdrawn.

Claim.—A fid made in two pieces or sections, so as to hold a thimble between said sections while a cringle is being driven over or on to it, and over or on to the thimble, and then capable of removal therefrom, substantially as described.

No. 37,880.—TAPPEN TOWNSEND, of Brooklyn, N. Y.—*Improvement in Spurs*.—Patent dated March 10, 1863.—This spur has two clamps which embrace the heel, fixing it in position without straps, having flanges which fit between the sole leather of the heel and the upper leather. It has also a heel plate attached to a screw running through the shank of the spur, the plate having a flange upon its lower edge, which is inserted between the heel and the upper.

Claim.—First, the use of the socket g, as described, and capable of receiving the dovetails on the ends of the branches f, in combination with the conical screw, or its equivalent, which perfects the joint while it causes the clamping of the sides of the heel.

Second, the flanged heel plate moved by the screw c, in combination with the flanges i i, the three flanges preventing in their use the depression of the spur.

Third, the heel plate e with its screw, in combination with the flat hooks j on the ends of the branches, by the joint functions of which the spur is clamped on and to the heel in the direction of its length.

Fourth, the combination of the conical screw-nut *d*, or its equivalent, the heel plate *e* flanged at its lower edge with its screw, and the flanges *i i*, as affording a practicable method of attaching spurs.

Fifth, the combination of *d e* and *i i* with the socket *g* and branches *f*, substantially as described.

No. 37,881.—JESSE URMY, of Wilmington, Delaware.—*Improvement in Harvester*.—Patent dated March 10, 1863.—One of the arms of the revolving reel is so arranged that as the rake-bar which is attached to it strikes the platform it is rotated horizontally to whirl the gavel round ninety degrees and drop it behind the machine with the ears of the grain towards the near side of the track. This rotation is performed by the inner end of the rake-bar, which is pivoted, coming in contact with a projection which swings it on its axis. The height of the reel standard is adjusted simultaneously with the platform by connecting rods and levers and the speed of the reel regulated by a nest of cone pulleys and a chain-tightener. A single-bar grain guard is rigged from the draught frame so as to be adjustable.

Claim.—First, the raking attachment, or its equivalent, as a substitute for one of the bars of an ordinary reel, when such attachment is capable of sliding in and out, and also of swinging around in the arc of a horizontal circle, substantially as and for the purpose set forth.

Second, the loop-pivot *N*, on one of the arms of the reel, for the purpose set forth.

Third, the manner, substantially as described, of fitting the reel standards *C C'* to the platform, draught frame, and adjusting lever *H*, for the purpose set forth.

Fourth, the spring rod *R* and eye-bracket *T*, in combination with a rake attachment *M2*, which operates substantially as described for the purpose set forth.

Fifth, the trip *W2*, constructed and applied and operating substantially as and for the purpose set forth.

Sixth, the manner of combining the slide *O* and rake-bar *M2* so that they move in and out together, while the rake-bar can turn independent of the slide, substantially as and for the purpose set forth.

Seventh, providing the holes *V Z* in the cam, reel, arm, and rake attachment, in combination with having the rake teeth and friction roller *Q* removable, for the purpose set forth in the manner described.

Eighth, the manner, substantially as described, of fitting the cam *L* and the reel-shaft bearing for operation together, with a view of having them adjustable, as set forth.

Ninth, in combination with the nests of pulleys for operating the rake reel at varying speeds, the chain-tightener, applied and operating substantially as described.

Tenth, the single-bar grain guard, applied on the front end of the draught frame, through the agency of a swivel-slotted device *J*, substantially as and for the purpose set forth.

Eleventh, so applying the grain side wheel to a lever-hanger, which is connected to the reel standards and to the draught frame, substantially as described, that both the platform, with the cutting apparatus, and the reel with the rake attachment, are elevated by the lever *H*, substantially as set forth.

No. 37,882.—MAXIMILIAN WAPPICH, of Sacramento, Cal.—*Improvement in Gun Carriages*.—Patent dated March 10, 1863.—The trunnions of the gun are pivoted upon the ends of vibrating arms whose inclination is governed by supporting screws or by another arm whose horizontal expansion is governed by a screw, so that by the combined movements of the breech elevating screw, and the screw supporting the cheek, the requisite elevation or depression may be obtained.

Claim.—First, elevating and depressing guns by their trunnions, through the agency of a folding and expanding carriage, or its equivalent, substantially as and for the purpose set forth.

Second, the construction of the cheek plates of a gun carriage so that they operate as levers, substantially as set forth.

Third, the application of the screw or screws *S* in the manner and for the purpose substantially as set forth.

Fourth, the training of the gun horizontally by a combination of circular and straight movements, substantially as and for the purpose set forth.

Fifth, adapting a gun which requires elevation and depression and horizontal training for use, in connexion with a port-hole which is in size very little greater than the muzzle of the gun, substantially as set forth.

No. 37,883.—ISAAC M. WATSON, of Grand Rapids, Mich.—*Improvement in Rat Traps*.—Patent dated March 10, 1863.—The weight is suspended above a drop platform which vibrates under the weight of the animal, discharging it into the cage beneath; the trap door is then replaced by the counterpoise weight being started quickly in its upward motion by the spring against which it strikes.

Claim.—The reacting spring *G*, in combination with the guides *b* and *d*, operated in the manner and for the purpose herein fully set forth and described.

No. 37,884.—J. D. BILLINGS, of Rutland, Vt., assignor to Himself and GEORGE R. WEED, of same place.—*Self-Inking Stamp*.—Patent dated March 10, 1863.—This invention is a method of operating, inking, and stamping apparatus within the compass of an ordinary piece of office furniture, and consists of a plunger with the usual spiral spring for retraction; this being rotated in one direction, by means of a wheel meshing into a rack, brings a slide carrying the stamp with its face over an inking roller, and on being rotated in the opposite direction restores the stamp to its original place; then being thrust down, it presses on the end of a lever, whose other end actuates the pressure pad, and the impression is given.

Claim.—The slide B, having the stamp D and apron E attached, and operated through the medium of the wheel F, rack C, and groove rod G, provided with the spring O, in combination with the roller L and the pressure pad K, operated from the rod G by means of the lever H, all arranged as shown, or in an equivalent way, for the purpose herein set forth.

No. 37,885.—JOHN B. DOUGHERTY, of Rochester, N. Y., assignor to Himself and MARY ANN LAWLER, of same place.—*Improved Machine for Sawing Barrel-heads, Shingles, &c.*—Patent dated March 10, 1863.—The plan of the frame of this machine resembles the segment of a circle, and is traversed horizontally by a segmental frame, in which the block is clamped to be carried over the horizontally revolving saw. This clamping is done by placing one edge of the block against a sharp edge and drawing a serrated edge against it by means of a wheel and pinions. The alternate raising of each end of the frame in sawing shingles is performed by the bent lever K and the vibrating frame moved by the handle H, which partly supports the rocking frame.

Claim.—First, the combination of the rack and pinions P P R R and movable bar N with the frame carrying the bolt, the whole operating in the manner and for the purpose substantially as described.

Second, the arrangement of the rods *l l* and the bar N, as herein described, whereby the latter may be adjusted so as to grasp a bolt of any shape.

Third, the combination of the bent lever K with the frame V V, said frame being made to rock on the shaft *f*, so as to allow a bolt to be entirely cut into shingles, in the manner set forth.

Fourth, the combination of the rod H with the frame C C and shaft B, said rod being so arranged as to allow the weight resting upon the rollers *r r* to be accurately adjusted.

No. 37,886.—EUGENE LEMERCIER, of Paris, France, assignor to AMASA BEMIS HOWE, of New York, N. Y.—*Improved Apparatus for Holding and Supporting Boots and Shoes for use with Machines for Screwing on Soles and Heels*.—Patent dated March 10, 1863.—This machine consists of two anvils for supporting the heel or the sole, as may be required. The former is adjusted in a socket beneath the frame carrying the screw, and the other is pivoted on an arm which projects radially from the standard of the heel socket so as to fall in the range of the screw when required for use.

Claim.—First, the combination of the movable, vertical, and beak-shaped anvils or supports, so that either may be moved into or out of action, as the case may require, substantially as and for the purpose set forth.

Second, arranging the anvil *d* on a frame or arm *g* that turns around the axis of the other anvil *a*, so that the face of either of the anvils, that is, for the time being in use, shall be in the line of the axis of the screw that is being fed in, substantially as described.

No. 37,887.—JOHN JACOB MILLER, of Chicago, Ill., assignor to Himself and ERNST PRUSSING, of the same place.—*Improvement in Lamps*.—Patent dated March 10, 1863.—A supporting cone and conical deflector joined, base to base, with perforated sides, are slipped up and down on the wick tube, being supported by a spring clamp.

Claim.—The combination of the perforated supporting cone G', with the perforated conical deflector G the latter converging upward in straight lines at an angle of 45° , or thereabout, with the perpendicular, and this either with or without the coronal flange H and the spring clasp or socket F, by which the cap may be adjusted vertically upon the wick tube.

No. 37,888.—AUG. WILH. SCHELL, of Clausthal, Kingdom of Hanover, assignor to GEORGE ASMUS, of Houghton, Mich.—*Improved Shaking Machine for Separating Ores*.—Patent dated March 10, 1863.—The ore is passed through a chamber in which it is exposed to the action of water which lifts and separates it, by which the heavier particles are brought to the bottom. A pipe passes up through the ore, and is covered by a cap or cylinder, so arranged that the heavier portions are continually falling into the end of the tube, while the lighter are removed from the chamber by the waste opening.

Claim.—The employment or use of the tube *a*, and cylindrical jacket *b*, in combination with the sieve A of a shaking machine, constructed and operating substantially as and for the purpose herein shown and described.

No. 37,889.—CHARLES D. TISDALE, of East Boston, Mass., assignor to Self and BAMA W. TISDALE, of Boston, Mass.—*Mode of Applying Cars to Railroad Tracks of Different Gauges*.—Patent dated March 10, 1863.—The track is laid with a converging section con-

necting the tracks of the different gauges with a guard-rail between to compel the flange or the wheel to hug the rail. A switch-rail on the broad-gauge track, and an extra broad-gauge track rail, arranged parallel with one of the guard-rails, extend from the switch down to the narrow-gauge track. The wheels are pushed in or out by yokes which operate sleeves on the axles.

Claim.—The wheel-changing rails C C, and the locking mechanism, or their equivalents, in combination with the two tracks A A B B, of different gauges, and with the wheels applied to the axles of the carriage, substantially as specified; and in combination therewith the guard-rails D D, for the purpose and to operate as described.

Also, the combination of the switch E E and the extra broad-gauge track rail F with the wheel-changing rails and locking mechanism, and the two tracks A A B B, of different gauges, combined with wheels applied to the axles of the carriage, in manner and so as to operate therewith substantially as specified.

Also, the peculiar wheel-locking mechanism, the same consisting of the two yokes G G and the wheel tubes made and applied to the axles, substantially in manner and so as to operate therewith as hereinbefore specified.

No. 37,890.—ISAAC C. SINGER, of Ellensburg, Cambria county, Pa.—*Improvement in Bending and Setting Tire.*—Patent dated March 10, 1863.—The machine consists of a middle fluted roller, supported by standards and driven by a crank and side rollers, which are adjustable relatively to the middle one by the teeth on the upper edge of the rack-bar, so as to bend the tire to the circle required. The tire is withdrawn by raising one end of the middle roller, the standard of which is slotted for that purpose. The side of the rack-bar is gauged for tires of different diameters.

Claim.—The arrangement and combination of the rack plates B, the movable upright I, the fluted roller J, the portable rollers E, with movable collars G, as operated by gear-wheels M and N, and gauged by figures, as described, and for the purpose herein set forth.

No. 37,891.—J. B. ATWATER, of Chicago, Cook county, Ill.—*Improvement in Projectiles for Rifled Ordnance.*—Patent dated March 17, 1863.—This invention provides an elastic belt in a cylindrical fissure around the elongated ball, which is expanded in the act of firing by certain wedges operated by plungers through the base of the ball.

Claim.—First, the corrugated wire web or cloth, or its specified equivalent, for the purpose herein described.

Second, in combination with the wire cloth and head band, the tongued wedges and flanged plungers, arranged in the manner substantially as described.

No. 37,892.—GEORGE E. BURT, of Harvard, Worcester county, Mass.—*Improvement in Horse-powers.*—Patent dated March 17, 1863.—The improvement consists in keeping the connecting chain links firmly in position by a hollow boss or tube passing nearly through the tread wood, relieving the tread bolt of its strain, placing the driving gear wheel directly under the horse, and making it gear with both the upper and under gears of the moving platform, connecting the links of the support by a bar near their centre to guide them more perfectly, proportioning the length of the supporting roll link to the circumference of the end track roller, that the link may pass at an acute angle and without jerking.

Claim.—First, the projecting boss *r*, in combination with the link *a*.

Second, the combination of the cog-wheel *f* and the endless platform, arranged in the manner and for the purposes set forth.

Third, the connecting of the links *h h* by the bar *j*, for the purpose described.

Fourth, the combination of the link *h* with the supporting rolls and end track, constructed and operating substantially in the manner specified and for the purposes set forth.

No. 37,893.—D. W. C. BAXTER, of Philadelphia, Pa.—*Improved Knapsack Sling.*—Patent dated March 17, 1863.—This improvement is intended to prevent the pressure of the knapsack upon the small of the back and the cramping of the movement of the arms, and it consists in supporting the sack by strips of wood extending from the shoulder to the hips; also in securing the chest straps so as to leave the arms free.

Claim.—First, the independent knapsack sling or supporter, constructed, arranged, and operating in the manner described.

Second, the strips A A, arranged and operating substantially in the manner described.

No. 37,894.—THOMAS BELL, of Bellport, Suffolk county, N. Y., and LOUIS KULEN, of New York, N. Y.—*Improvement in Stump Extractors.*—Patent dated March 17, 1863.—The invention consists in a frame on wheels, to which pendent inclined levers are attached; said levers, after their points have been insinuated under the spur roots of the stump, being forcibly raised by screw rods worked by nuts on washers above the frame.

Claim.—The bars or teeth D, in combination with the screw rods E, the above parts being attached to the frame C, and the latter placed on a wagon or mounted on wheels in any suitable way, and all arranged to operate as and for the purpose herein set forth.

No. 37,895.—EDGAR M. BIRDSALL, of Penn Yan, Yates county, N. Y.—*Improvement in Threshing Machines*.—Patent dated March 17, 1863.—This invention consists in a sleeve support of peculiar shape, through which the extension rod of the tumbling shaft passes to its connexion with the bevel gearing which drives the threshing cylinder; said sleeve support, by a curved arm extension, affording a socket or bearing for the outer end of the axis of the pinion and the spur wheel, which drives the cylinder.

Claim.—First, the support G, when made and used as and for the purpose specified.

Second, the wheels C D and E, when arranged as specified and used in combination with the support G, as set forth.

No. 37,896.—SAMUEL BISSICKS, of New York, N. Y.—*Improvement in Combined Washstand and Water-closet*.—Patent dated March 17, 1863.—The improvement consists in the arrangement of the parts, being a washstand above; in a cupboard below is a water-closet basin, which swings in or out, and, while in, serves for a receptacle for the dirty water from the wash-basin.

Claim.—The combination and arrangement of the stand A, or its equivalent, with the bowls B and C, faucet I, valve L, pipes G and E, and swivel F, substantially as described.

No. 37,897.—MATTHEW C. BOGIA, of Philadelphia, Pa.—*Improvement in Machine for Removing Snow and Ice from Railroads*.—Patent dated March 17, 1863.—This invention consists of a furnace upon a truck, with an artificial blast and a chimney which is divided at the front of the truck into two flues, and, being bent down, brings the heated air to impinge upon the two rails to melt the ice thereon.

Claim.—The fire chamber C, pipes F and F', and blower E, the whole being constructed, arranged on a truck, and operating substantially as set forth.

No. 37,898.—ADOLPHUS BONZANO, of Detroit, Mich.—*Improvement in Machine for Rifling Cannon*.—Patent dated March 17, 1863.—This apparatus is designed for rifling or re-rifling cannon by being attached to the muzzle of the piece and operated without dismounting it. A four-square yoke is attached centrally to the muzzle, and a cutter-head, with the requisite number of cutters, and mounted upon the end of a screw, is introduced as far back in the bore as the rifling is designed to extend, and then, by means of the screw, is retracted, bringing the cutter against the bore, and producing the groove. The screw is withdrawn by the revolution of the nut in which it runs, and the twist is given by a certain amount of revolution of the screw under the control of gearing from the retracting mechanism and a pin running in a slot in the axial screw in the bore. The cutters are mounted upon inclined seats, and controlled in their rear by a washer, and in front by a spring. In inserting the cutters, their friction upon the muzzle causes the spring to recede; but in drawing back, the hold taken by the cutters in the metal brings them as far back as is permitted by the washer, and then forcible retraction makes the rifle groove.

Claim.—First, the cutter-head, having its cutters *i i*, or stock to which the said cutters are attached, fitted to grooves *r r*, with inclined bottoms, and having applied, in connexion with them, a spring *t* and collars *q s*, substantially as herein specified.

Second, the employment, for producing a regular or progressive twist of the rifle grooves, of a barrel *m*, connected by a cord or chain with the cutter bar, and geared with the said bar, substantially as herein specified.

No. 37,899.—JOHN H. BRECKENRIDGE, of West Meriden, New Haven county, Conn.—*Improvement in Lanterns*.—Patent dated March 17, 1863.—The object of this improvement is to so construct a lantern that the wick of the lamp may be operated from the outside without opening the lantern. The usual lamp is enclosed within a cylindrical base, to which is attached the globe glass. From the wick tube extends a shaft, by which the feed rollers are rotated. A head on the end passes to the outside, and lies in a cup-shaped recess, so as not to project beyond the circle of the base. A T-shaped groove on the lower side of this recess admits of the shaft and head being slipped down so as to withdraw the lamp at will.

Claim.—The combination of the head of the shaft of the mechanism that controls the wick with an opening in the lantern case and a receptacle within the lantern, the combination, as a whole, operating substantially as set forth.

Also, constructing the receptacle upon the interior of the lantern case with a slot, to permit the introduction of the shaft of the mechanism that controls the wick of the lamp, substantially as set forth.

Also, the combination of the receptacle within the lantern with the shaft of the instrument that acts upon the wick, the whole operating substantially as set forth.

No. 37,900.—ADAM S. BROWN, of Lebanon, Pa.—*Improved Washing Machine*.—Patent dated March 17, 1863.—This machine consists of a stationary tub, in which is an inclined concave formed of rollers pivoted at their ends into a frame. Above this is a rubber, which is formed of slats fastened to a vibrating frame, and driven by an arm and pitman from the rock-shaft G.

Claim.—The combination and arrangement of the slatted rubber E, concave washboard D, jointed arms H H J J, and rock-shaft G, substantially as and for the purpose herein described.

No. 37,901.—EDWARD CONWAY, of Dayton, Ohio.—*Improved Liniment*.—Patent dated March 17, 1863.—This improvement consists in the production of an amber-colored transparent liniment by the distillation of the following compounds: Tincture of camphor, one part; ammonia, one part; tincture of opium, one part; spirituous extract of orris root, one part; spirituous extract of white-oak bark, one-half part; spirituous extract of cedar bark, one-half part; 4th-proof brandy, one-half part; whiskey 35° above proof, one-half part.

Claim.—The production by distillation from the above-described ingredients, in the above-described amounts and strength of the above-described liniment, for the stopping of blood, the cure of rheumatism, cuts, and inflammation of all kinds.

No. 37,902.—GEORGE L. CUMMINGS, of New York, N. Y.—*Improvement in Carriage Jacks*.—Patent dated March 17, 1863.—Upon a sill-piece are standards, between which is a rest sliding by vertical slots upon bolts which pass through it and through both standards. This slide rest has a series of notches or steps of increasing height to suit the varying heights of axles under which it is placed; it is elevated by an eccentric lever journaled to the stand, and beneath the slide rest.

Claim.—The combination of the eccentric lever C with the upright slide rest D, by which the power to raise the axle is obtained, substantially as described and set forth as above.

No. 37,903.—JAMES DAYKIN, of Cleveland, Ohio.—*Improvement in Water Elevators*.—Patent dated March 17, 1863.—The improvement is in the form of the chain and the windlass wheel, the former being made of a round rod, each link of the former consisting of a rod bent so as to have two hooks to grasp the eyes of the preceding link, and two eyes to form a point of attachment for the next link, and enclosing a nearly rectangular space into which the rounded projections of the windlass wheel protrude in the act of rotation.

Claim.—First, the flat chain, (Figs 3 and 4,) when the links are formed by means of the rings or eyes *b b*, cross-bar *c*, rods *a a*, and hooks *d d*, arranged and operating substantially as set forth.

Second, the herein-described windlass wheel C, when constructed as specified, in combination with a flat chain, arranged and operating as specified.

No. 37,904.—HAMPTON DODGE, of Buffalo, N. Y.—*Improvement in Apparatus for Nicking Horses*.—Patent dated March 17, 1863.—This consists of a saddle and a metallic back strap, to which is fixed a crupper and a hinged bar for retaining the tail in an elevated position. The tail is also tied to a point on the back strap.

Claim.—First, the saddle C, in connexion with the metal plate A, for the purpose herein set forth.

Second, the hinged bar *j*, for the purpose specified.

Third, the strap *g*, the bar *j*, and the crupper bars H, arranged as and for the purpose herein set forth.

No. 37,905.—JAMES P. EATON, of Manchester, N. H.—*Improvement in Sheep Racks*.—Patent dated March 17, 1863.—Along the middle of the platform on which the hay is placed is a raised walk, and on each side above the heads of the sheep, which feed at the sides, is a board, inclined inwards so as to allow the hay upon it to slide down and be reached by the sheep.

Claim.—The construction of sheep racks with an elevated walk A between them, in combination with the inclined feeders E E, substantially as herein set forth.

No. 37,906.—A. H. EMERY, of New York, N. Y.—*Improvement in Projectile for Firearms*.—Patent dated March 17, 1863.—The soft metal body of the shot contained in the case is provided with a stay of a lighter and more rigid character, so as to prevent the swaging of the soft metal, and to keep the rear of the projectile relatively lighter than the anterior portion.

Claim.—The construction and arrangement of the hard metallic stay H with the soft body of the shot A, essentially as and for the purposes herein described and set forth.

No. 37,907.—MARTIN R. ETHERIDGE, of Bethel, Oxford county, Maine.—*Improved Machine for Lasting the Uppers of Boots and Shoes*.—Patent dated March 17, 1863.—The last is placed in an inverted position on a toe rest and ankle support, and the upper leather pressed against and caused to lap over the edge of the sole by the mitre-edged crimping jaws, operated by yokes, cams, and springs, and by a spring heel presser. The crimping jaws have cushions interposed between them and the leather, and the heel support and toe piece are adjusted vertically by set screws.

Claim.—The construction of the crimping jaws with the mitred joints or ends arranged together, substantially as described.

Also, the combination of a flexible or heel spring presser E, as described, with the crimping jaws and a toe rest, substantially as specified.

Also, the peculiar combination for operating or moving the crimping jaws, both toward and from the last, the same consisting in the yoke M, the cam or cams N, the springs *g g*, and the mitre joints *b b b b*, the whole being arranged substantially as specified.

Also, in combination with the crimping jaws, mechanism substantially as described for holding the last both at its heel and toe, and mechanism for adjusting it, at either or both ends, vertically with reference to the crimping jaws.

Also, the combination and arrangement of the elastic cushions *a2 a2* with the crimped jaws *D D*.

No. 37,908.—JOHN J. FORT, of Oshkosh, Winnebago county, Wis.—*Improvement in Car Couplings*.—Patent dated March 17, 1863.—The coupling link is held level, and on entering the draw head runs up the incline, and, striking the guard *d*, falls with the link, the latter being retained by the permanent catch.

The link is detached by the motion of the toggle attached to the guard, which raises it and the link, throwing the latter off the catch.

Claim.—First, the construction, application, and adjustability of the guard *D d*, and the use thereof, in combination with the catch *c* and frame *a a*, substantially as set forth.

Second, the application of the arm *e*, lever *f*, and shaft *g*, for the uses and purposes set forth.

No. 37,909.—OTHNIEL GILMORE, of Raynham, Bristol county, Mass.—*Improved Machine for Arranging Nails for use in Machines for Nailing Shoes*.—Patent dated March 17, 1863.—This machine has two inclined planes with a reciprocating plunger sliding in a recess in the space at their intersection. The plunger drives them to a conduit which is so arranged as to pass the nails out of the machine when their heads are wrongly presented, and place the others in the receiver.

Claim.—The combination of the impeller or plunger *D*, the two inclined planes *A B*, the space *C*, and the receiver *I*, the whole being arranged and to operate substantially as specified.

Also, in combination therewith, the conduit *H*, so constructed and arranged with respect to the space *C* as to enable the reversed nails to be discharged laterally out of the collection in manner as specified.

No. 37,910.—F. A. GLEASON, of Rome, N. Y.—*Improved Machine for Mitre Dovetailing*.—Patent dated March 17, 1863.—The invention consists in arranging a series of cutters at such angles and in such relative positions that they shall cut both tongue and groove of a mitre dovetail joint, at any intermediate point between the extremities of any piece of lumber.

Claim.—The particular arrangement of cutting tools by which a mitre dovetail joint, complete in both its parts, i. e., tongue and groove, may be cut at any intermediate point between extremes of any piece of lumber; doing the cross-cutting and dovetailing simultaneously in the same operation.

No. 37,911.—JAMES H. HARTWELL, of Jefferson county, Ind.—*Improved Evaporator for Saccharine Liquids*.—Patent dated March 17, 1863.—The furnace consists of a direct and a return flue alongside of each other, and above is a pan, one-half of which is divided longitudinally and the other transversely, by partitions, which cause the saccharine liquid to take a serpentine course over the bottom of the pan from the spot where it is received from the strainer, under the supply-pipe, to its exit as condensed sirup.

Claim.—First, the divided pan *F*, in combination with a furnace, also divided as shown, both arranged and operating substantially as described and for the purpose set forth.

Second, the pan *F*, composed of a longitudinally and horizontally divided portion, for the purpose set forth.

Third, the strainer *E*, in combination with the double pan *F* and divided furnace, the whole to form an improved evaporator, as and for the purpose described.

No. 37,912.—AARON HIGLEY, of Warren, Trumbull county, Ohio.—*Improvement in Corn-shellers*.—Patent dated March 17, 1863.—The corn is fed into the machine from a hopper, and exposed between the toothed cylinder and a slide rest, which is pressed towards the cylinder by arms and springs; the slide rest is inclined, and the cylinder toothed spirally, so as to drive the cob out of the machine at a hole, while the corn falls into the hopper bottom and is discharged.

Claim.—The special arrangement of the hopper *B*, slide rest *L*, arms *N*, springs *S*, in combination with the toothed cylinder *C*, when operating conjointly as and for the purpose set forth.

No. 37,913.—AMASA B. HOWE, of New York, N. Y.—*Improvement in Sewing Machines*.—Patent dated March 17, 1863.—Patented in England February 8, 1862.—The improvements in this machine consist, first, in an adjustable needle or needle-bar box, by which the needle, whether coarse or fine, can be regulated and made to operate in the required proximity to the shuttle race, shuttle, hook, or other device used for securing the loop of the needle. Second, a device for counteracting the lateral deflection of the needle. Third, an adjustable and detachable presser foot or cloth holder. Fourth, in the feeding apparatus.

The devices are explained at length in the claim.

Claim.—In combination with the needle-bar box *B B'*, the screw *p* and the spring *o*, for adjusting and controlling the proper adjustment of said needle-bar box and the needle bar and needle therein, substantially as described.

Also, in combination with the needle, the clip or arm *c* of the lever *c d e f*, and the cam *g*, for bringing the needle into proper position should it be deflected by any cause, the whole operating in the manner and for the purpose substantially as described.

Also, the combination of the adjustable needle-bar box with the clip *e* and its operative parts, substantially as described.

Also, the arrangement of the compound levers and their action upon and with the feed wheel, as herein described and shown.

No. 37,914.—GUSTAVUS A HANKINSON, of Manahocking, Ocean county, N. J.—*Improved Automatic Nose-Bag*.—Patent dated March 17, 1863.—This nose-bag is suspended by a cord which passes through a ring on the nose band, through the loop at the junction of the cheek strap and brow band, and then over the hames, so that the lowering of the head of the horse brings the bag against the animal's nose.

Claim.—Suspending the nose-bag in such manner that the natural movements of the horse in feeding will cause the bottom of the bag to approach or recede from his mouth, substantially as described.

No. 37,915.—K. P. KIDDER, of Burlington, Vt.—*Improvement in Bee-hives*.—Patent dated March 17, 1863.—The improvements in this hive consist of a series of separating plates with marginal cleats placed between the movable comb-frames, to keep them at their relative distances; also in a plate placed at the entrance of the hive, to regulate the height of the opening and prevent the passage of drones and the queen, while admitting the ingress and egress of the workers.

Claim.—First, providing the division plates *E* with cleats *g h*, as shown and described, for the purpose of retaining or holding the comb-frames *D* in proper position in the hive, as specified.

Second, the regulator *F*, provided with a longitudinal slot *k*, two vertical slots *l l'*, and a notch *j*, combined as shown; the regulator being applied to the bee-entrance *m* by means of the button *G*, substantially as and for the purpose herein set forth.

No. 37,916.—JOHN K. LEEDY, of Bloomington, Ill.—*Improvement in Sugar Evaporators*.—Patent dated March 17, 1863.—The sorghum juice is exposed to the fire in pans and a still, over holes in the roof of the furnace, which is covered with water except where held back by the rims which surround the boiler holes. The vapor from the still passes through a worm in the reservoir, and discharges through an opening into a bucket or the pans.

Claim.—First, the water tank *B*, constructed in the manner and for the purpose herein specified.

Second, the bottom of the pans arranged in the manner herein set forth, in connexion with the rims on which they rest.

Third, the movable reservoir, and movable still, as herein fully described.

Fourth, the extension of the side walls of the furnace, for the purpose herein described.

No. 37,917.—JOHN G. LEFFINGWELL, of Newark, N. J.—*Improvement in the Mode of Elevating Lamp Chimneys*.—Patent dated March 17, 1863.—The collar and dome on which the chimney is supported are made to rise by slides and guides to a sufficient height to trim the wick. The slides being attached to the collar, and the guides to the burner, embrace each other by lapping flanges.

Claim.—First, the guides *B*, or their equivalent, when attached to the exterior of the burner.

Second, the slides *g*, or their equivalent, when attached to the exterior of the gallery, and working either on the insides or outsides of guides *B*.

No. 37,918.—ADOLPH MILLOCHAN, of New York, N. Y.—*Improvement in Preparing a Paint Oil from the Petroleum Residuum*.—Patent dated March 17, 1863.—The residuum is mixed with 40 per cent. of water, to remove the acid with which the petroleum has been treated, and then the resinous matter treated with 20 per cent. of caustic alkali, to neutralize the remaining acid.

Claim.—The process, substantially as herein specified, of manufacturing oil adapted to mixing with paints and colors, from the acid residuum in the refining of petroleum or coal oils, as set forth.

No. 37,919.—PETER W. NEEFUS, of New York, N. Y.—*Improvement in Ponchos*.—Patent dated March 17, 1863.—This consists of a blanket with an air-tight compartment in its corner, or elsewhere, to act as a pillow when inflated; or it may be made large enough to serve as a shelter-tent, with inflatable margins to afford pillows for the occupants.

Claim.—A poncho convertible into a blanket or tent, and having attached to it an air-pillow or air-pouch, as and for the purpose substantially as described.

No. 37,920.—T. J. PENNY, of Wooster, Ohio.—*Improved Combined Wrench, Scraper, and Screw-driver*.—Patent dated March 17, 1863.—The screw-driver is at the end of the handle, and the scraper is formed by sharpening one of the jaws that hold the screw-nut.

Claim.—As an improved article of manufacture, a combined wrench, scraper, and screw-driver, constructed substantially as herein set forth.

No. 37,921.—SAMUEL REMINGTON, of Ilion, Herkimer county, N. Y.—*Improvement in Securing the Base-pin of Revolving Pistols*.—Patent dated March 17, 1863.—This is an additional security for revolving pistols, in which the base-pin cannot be drawn out in front without first moving the lever. It consists in so arranging the base-pin and the lever, that the latter retains the base-pin and prevents it from being drawn out beyond a certain point.

Claim.—So constructing the base-pin and arranging the joint of the lever in relation to the base-pin, that said joint shall prevent the base-pin from being drawn entirely out of the frame, substantially as herein specified.

No. 37,922.—GILES BOLIVAR ROE, of Paine's Point, Ill.—*Improvement in Foot Corn-Planters*.—Patent dated March 17, 1863.—The corn for each hill is dropped by hand into the hopper of the planter, and is driven into the ground by pressure upon an oscillating step to which the foot is lashed, the step being connected with the plunger.

Claim.—The combination of the oscillating foot-board F with the box A, plunger E, spade C, and plate D, all in the manner herein shown and described.

No. 37,923.—GILES B. ROE, of Paine's Point, Ogle county, Ind.—*Improvement in Cattle Pump*.—Patent dated March 17, 1863.—A reservoir is provided in the well, and connected with it is an elastic drum; the weight of the animal drives the water from the drum into the drinking trough, and the removal of the weight of the animal causes the elastic drum, in assuming its original dimensions, to fill itself again from the cistern.

Claim.—First, the drum C, placed in the well B, and provided with a valve D, at its lower end, in combination with the elastic or flexible drum I, connected with the movable platform G, and communicating with the drum C, to operate as and for the purpose set forth.

Second, the combination of the pipes F K with the tube E, arranged as shown, when used in connexion with the drums C I, for the purpose set forth.

Third, the suspended or self-adjusting trough M, placed on the platform G, for the purpose herein set forth.

No. 37,924.—TECUMSEH STEECE, United States Navy.—*Improvement in Rifling Ordnance*.—Patent dated March 17, 1863.—The rear of the bore is smooth, and towards the muzzle it is grooved in a manner which is clearly explained in the claim.

Claim.—A cannon, or other fire-arm, having at its rear end a smooth cylindrical bore A, and near its muzzle longitudinal or nearly longitudinal grooves B, which constitute enlargements in the bore, and are separated by lands *b*, the ridges or inner surfaces of which lands are in their radial distance from the centre equal to the radius of the smooth portion A of the bore, all as herein described, so as to guide the projectile during its entire passage through the bore, confine the gases as much as possible until the projectile approaches the muzzle, and then permit their escape longitudinally, to impart rotation to the projectile by acting against oblique surfaces thereon, or on a sabot or casting to be used therewith.

No. 37,925.—ABBEY S. SMITH, of Lockport, Niagara county, N. Y.—*Improved Mechanism for Starting Sewing Machines*.—Patent dated March 17, 1863.—This improvement consists in a vibrating segment which is operated by a lever on the table of the sewing machine so as to bring the teeth of the segment against the teeth of a wheel on the fly-wheel shaft of the machine to start it beyond the dead point without reaching down to grasp the fly-wheel.

Claim.—The self-adjusting elongated segment H, or its equivalent, whose lever is jointed to the frame, in combination with the friction wheel G, whether said parts are provided with teeth or not, in such a manner that when at rest the segment is raised and removed from the wheel, but that when engaged sufficient motion is imparted to the wheel to throw the crank past the dead point, arranged and operating substantially as herein set forth.

Also, in combination with the segment and its lever, the adjusting joint, composed of the pivot *f*, and slots *g g*, or their equivalents, and the coiled spring L, or its equivalent, for the purpose of allowing a vertical movement to the segment and producing the proper reaction, substantially as and for the purposes herein specified.

No. 37,926.—LOWELL H. SMITH, of Owensville, Clermont county, Ohio.—*Improvement in Camp Stoves*.—Patent dated March 17, 1863.—This stove is made in sections which fit within each other; when the upper or outer section is raised and supported upon legs, the other sections slip out telescopically to the extent admitted by their flanges.

Claim.—The construction of a portable stove in flanged sections A B C, adapted to be extended for use by the elevation of the upper section A on legs F, occupying sockets E, and when not in use to be slid within one another in the manner set forth.

No. 37,927.—N. H. SPAFFORD, of Providence, R. I.—*Improvement in Machinery for Assorting Bristles*.—Patent dated March 17, 1863.—The bristles are automatically fed at regular intervals to a travelling horizontal belt and carried to the carding and combing devices, and to those by which they are "evened up" at one end; they are then passed between and carried along by two endless horizontal travelling belts, pulled out, assorted, and deposited according to their respective lengths in boxes by means of nippers placed upon a reciprocating horizontal travelling platform.

Claim.—First, automatically conveying the bristles to the feeding belts for the assorting devices preparatory to their being carded and evened up by means of positive mechanical devices, arranged and operating substantially as described.

Second, the arrangement of the box T, with its sliding plate Y, and seizing tongues or jaws, so operating together as to first cause the tongues to seize or take a layer of the bristles inserted in the receiving chamber of the machine and then convey them to the belts *l* and *m*, substantially as described.

Third, in combination with the mechanism employed in machines for assorting bristles, the devices hereinabove described, for feeding or conveying the bristles to the same, arranged and operating as set forth.

Fourth, the peculiar arrangement and combination of the cam-shaped wheels L M with their rack bars P Q, connected with the box T and its plate Y, in the manner and operating together as described for the purposes specified.

Fifth, giving the pinion *a*, engaging with the rack bar of the sliding plate Y, a sufficient rotary motion while the box T is being turned upon its shaft R as a centre, so as to prevent a leverage upon the same by the said bar and thus obviate friction and binding of the parts, substantially as described.

Sixth, imparting to the bristles contained in the receiving chamber a motion in the proper direction, by means of a pawl *w* and ratchet wheel *v*, the said pawl being arranged and operating in connexion therewith substantially in the manner and by the devices described.

Seventh, the use of the vertical separator *i*, for piercing and separating the bristles in their receiving chamber, arranged and operating as described.

Eighth, the forked swinging plate I, so arranged and operated that while it prevents the escape of the bristles from the receiving chamber it will yet allow of the easy removal of the same by the devices described.

Ninth, the combination of the lever *n*, loose tongue *e*, of the sliding plate *y*, and projecting rod or arm *q* of the driving shaft, arranged together and operating in the manner and for the purpose specified.

Tenth, automatically drawing out or taking the bristles from the machine, according to their respective lengths, and thus assorting the same by means of a series of nippers or any suitable seizing devices operating substantially as described.

Eleventh, the combination of the travelling platform *k'*, studs *f' f'*, &c., and nippers *n' n'*, &c., so arranged and operating together as to open and close the said nippers, and to both seize the bristles and deposit them in boxes at the proper times, substantially as described.

Twelfth, the arrangement of the horizontal trip rod *S'*, having a reciprocating rectilinear movement at regular intervals of time imparted to the same by any proper means, and operating substantially as described and for the purposes specified.

Thirteenth, the combination of the trip rod *s''*, inclined lever *v''*, and cam-shaped grooved sector or drum *y''*, operating together as described.

No. 37,928.—W. G. STERLING, of Bridgeport, Conn.—*Improvement in Lamps*.—Patent dated March 17, 1863.—The collar upon which the flame spreader is mounted is separated from the wick tube by a non-conducting composition. The flame spreader is punched out of one piece and made in a double bridge shape so as to offer a resistance to the flame and cause a more perfect combustion, and is pivoted so as to lie over in trimming the wick and be retained in a vertical position by a stop.

Claim.—First, the skeleton bridge spreader G, constructed as herein described, when the same is combined with the wick tube and isolated from this tube and the lamp cap by means of a non-conducting medium, substantially as described.

Second, securing the bridge-holding cap *c* to the wick tube by means of a non-conducting cement, substantially as herein described.

Third, pivoting the skeleton bridge G, or its equivalent, to an isolated cap *c*, as and for the purposes herein described.

Fourth, the stops *e e* on cap *c*, in combination with the pivoted bridge G, substantially as described.

Fifth, constructing the open or skeleton bridge G of one piece of metal stamped out so as to form the pivot holes, openings *k k*, portions *l l*, and arched bridges *n n*, as described.

No. 37,929.—SHERMAN R. WARNER, of New Haven, Conn.—*Improvement in Pipe Coupling*.—Patent dated March 10, 1863.—The pipes have a collar and flange soldered to their ends, and two of these being brought together form a wedge-shaped flange; semicircular clamps are forced upon and close them, in which position they are retained by a ring upon their inclined or slightly conical periphery.

Claim.—The combination and arrangement described of the rings A A, clamps E, and forcing ring F, in the manner and for the purpose substantially as herein specified.

No. 36,930.—JOSEPH VAN KIRK, of Philadelphia, Pa.—*Improvement in Coal-Oil Burners for Lamps*.—Patent dated March 17, 1863.—The dome whose flange supports the chimney is attached to a cylindrical perforated case which fits within an outer perforated case, being lifted therefrom to trim the lamp without detaching the chimney. Another space between the perforated cases admits of the ingress of air.

Claim.—First, the case B, with the dome or deflector G connected permanently to the same, when combined with and rendered detachable from the case A, substantially as and for the purpose herein set forth.

Second, so constructing and arranging the perforated cases A and B, that an annular space shall intervene between the two for the purpose specified.

No. 37,931.—WM. WEITLING, of New York, N. Y.—*Improvement in Sewing Machines.*—Patent dated March 17, 1863.—This invention consists in the application to a sewing machine of a double-thread holder, which operates, in conjunction with the needle, a thread-carrier, and a shuttle, to form the button-hole stitching. The double-thread holder crosses its two threads under the needle and vertical thread carrier, the threads of which interloop with the crossed threads which are secured by the shuttle thread, passes through the loops of the needle and vertical thread-carrier and results in a button-hole stitch.

Claim.—First, a double-thread holder operating in such a manner as to cross its two threads alternately to the right and to the left, and having a reciprocating motion to and from the needle or needles of a sewing machine, substantially in the manner and for the purpose herein described.

Second, also, in combination with a sewing mechanism provided with a thread-carrier operating through the opening of the button-hole, a double-thread holder operating in such a manner as to cross its two threads alternately to the right and left, and having a reciprocating motion to carry the crossed threads to and under the needle and vertical thread-carrier *c*, substantially in the manner and for the purpose described.

Third, a thread-holder consisting of a pair of levers moving on a common fulcrum toward and from the needle or needles and having also a crossing motion of its arms, whose ends *e'* and *e''* are each provided with an eye or thread leader for the passage of thread, as herein described and for the purpose set forth.

Fourth, the combination of a shifting double-thread holder and a thread-carrier with a sewing mechanism, substantially as herein described and for the purpose set forth.

Fifth, securing the thread-holder plate *b* to the angular supporter *q*, by means of double hinges *i'* and *i''*, so as to raise or lower the double-thread holders *e'* and *e''* at pleasure, substantially in the manner and for the purpose described.

Sixth, the button-hole guide consisting of the two pins *o'* and *o''*, whether attached to the bed-plate or to the cloth-presser, when the same are constructed and operated substantially in the manner and for the purpose described.

No. 37,932.—JAMES E. WOOD, of Worcester, Mass.—*Improvement in Mowing Machine.*—Patent dated March 17, 1863.—This arrangement is intended to elevate the cutter bar suddenly from the ground, and consists of a lever pivoted to the axle of an auxiliary wheel which runs behind the cutter bar, a projection on the said lever engaging a lug on the cutter bar to raise it on the rotation of the hand lever by the driver.

Claim.—The combination of the arm *p* and the cam *q*, or their mechanical equivalent or equivalents, with the auxiliary wheel *m*, its operative lever, and the cutter bar G, hinged or applied to the frame A, or the supporting part *i* thereof, substantially in the manner and so as to operate as described, the said appliances to the cutter bar and its supporter constituting what may be termed a duplex motion or mechanism, by the aid of which, such cutter bar may be elevated or raised off the ground and above the same with great celerity when the mowing machine may be in use.

No. 37,933.—WILLIAM WRIGHT, of South River, Middlesex county, N. J.—*Improvement in Grates.*—Patent dated March 17, 1863.—The bars of this grate are independent and introduced through holes in the furnace from the front and supported by cross plates and the furnace back.

Claim.—A fire grate for furnaces constructed of a series of independent sliding bars C, fitted in bearing plates B, and extending through the front of the furnace, substantially as set forth.

No. 37,934.—JOSEPH M. YATES, of Fultonville, Montgomery county, N. Y.—*Improvement in Skates.*—Patent dated March 17, 1863.—The tread of this skate is made of one piece with the runner, being re-curved and flattened out to support the foot, and the ends of the heel and sole pieces are connected by a spring to the upper edge of the runner. A thumb-screw passes through a heel piece into the boot, and through a slot in the head of the screw the instep strap is passed which binds that part of the foot to the skate.

Claim.—First, constructing the toe and heel plates B and D and runner A all in one piece, by turning and bending over the ends of the runner and flattening the same, as set forth, in combination with the springs C E attached to the plates B D, and resting on the runner A, as set forth.

Second, attaching the screw or heel spur F to a thumb plate G, the latter having a slot made in it to allow the heel strap H to pass through, and the former being allowed to turn in the plate D, substantially as and for the purpose specified.

No. 37,935.—MILLS L. CALLENDER, of New York, and NELSON W. NORTHRUP, of Greene, N. Y., assignors to Themselves and CHARLES H. WELLING, and by mesne assignments to JAMES R. EADS, of St. Louis, Mo.—*Improvement in Operating Ordnance*.—Patent dated March 17, 1863.—This invention consists in supporting the gun platform upon a piston in a steam cylinder, by which it can be raised and lowered and rotated freely, the object being to project the platform even with the deck of the gunboat to discharge the gun and to lower it, so that the roof of the gun shall form the deck of the boat and the men be protected in loading. It also consists in leading the steam through the piston, and piston rod, head and arms supporting the gun, so as to bring a pressure on either side of the trunnions to run the gun out or in.

Claim.—The construction and arrangement of the gun, platform, and shield, so that it may be freely revolved while supported on a cushion of steam within the cylinder, as described.

Also, the method of transmitting steam pressure to either or both sides of the trunnions without interfering with the free rotation of the platform and shield, substantially as described.

No. 37,936.—AUGUSTUS N. CLARK, of Boston, Mass., assignor to the Rubber Clothing Company, of same place.—*Improvement in Knapsacks*.—Patent dated March 17, 1863.—To the lower side of the knapsack a strap is buckled, which passes up the front side of it and there bifurcates, passing to the upper edge, where they run over guides, and from them over the shoulders, across the breast, and fasten at the lower front corners.

Claim.—The combination with shoulder straps radiating from an adjustable centre strap, as described, of guides or loops fixed to the upper side of the knapsack, the whole being arranged together and operating substantially as described and for the purpose specified.

No. 37,937.—CHARLES JACKSON and T. GOODREM, of Providence, R. I., assignors to CHARLES JACKSON, aforesaid.—*Improvement in Breech-loading Fire-arms*.—Patent dated March 17, 1863.—The barrel of this piece rotates on the stock for loading at the rear of the barrel, and is retained in position or allowed to rotate by a pivoted stop.

A plate attached to the breech acts so as to rotate and withdraw the spent cartridge case on the rotation of the barrel.

Claim.—First, the stop *E* arranged on a pivot *d* in such a manner, in combination with the barrel and breech and with a screw *b*, or its equivalent, as to serve as a stop in both the opening and closing movements of the barrel, but so as to permit, when desired, the unscrewing of the barrel far enough to detach it from the breech, substantially as herein specified.

Second, the plate *h* attached firmly to the breech and applied in combination with the screw *D* to produce both a rotary and a longitudinal motion of the cartridge cases for the purpose of withdrawing them from the barrel, substantially as herein specified.

No. 37,938.—Cancelled.

No. 37,939.—SAMUEL J. OLMSTEAD, of Binghamton, N. Y., assignor to Himself, WARING S. WEED, and D. S. AYRES, of same place.—*Improvement in Ploughs*.—Patent dated March 17, 1863.—A large part of the landside of the plough is occupied by a wheel in line with the landside, and extends below the sole, so as to revolve and diminish the friction. The wheel is supported by a projection cast upon the mould-board.

Claim.—First, the attachment of a wheel upon the landside, forming a large part thereof, and projecting below the bottom of the plough, while its exterior or outer surface is in line with the landside, for the purpose of removing the friction of the plough while at work, as set forth.

Second, making the supporting arm *e* of the wheel a part of the mould-board casting.

No. 37,940.—PASCAL PLANT, of Washington, D. C., assignor to Himself and RUFUS WAPLES, of same place.—*Improvement in War Rocket*.—Patent dated March 17, 1863.—The improvement consists in pressing the rocket composition around the powder magazine, so as to leave a space between it and the outer casing for the communication of fire, and in the arrangement of conical heads with openings toward the rear to give direction to the missile.

Claim.—First, the pressing of the rocket composition around the case of the powder magazine, forming a cylinder of less circumference than the interior of the outer case, that the gas may pass through the annular space to the holes in front, and thence pass to the cap pieces.

Second, one or more conical cap pieces of less diameter than the body of the projectile to give direction to the gas from the burning composition, constructed and operating substantially as and for the purposes described.

No. 37,941.—WILLIAM M. WELLING, of New York, N. Y., assignor to SAMUEL G. WELLING, of New Rochelle, N. Y.—*Improvement in Rings for Martingales*.—Patent dated March 17, 1863.—This martingale ring consists of a metallic core with a composition covering.

Claim.—The ring for martingales, &c., manufactured as set forth, with a metal ring enveloped in composition, as and for the purposes specified.

No. 37,942.—BENJAMIN F. SMITH, jr., of Albany, N. Y.—*Improved Submarine Batteries*.—Patent issued March 17, 1863.—Antedated November 15, 1862.—The invention consists in fitting a tube through the prow of a vessel through which a shell is projected to be exploded against the enemy's ship by percussion. A suitable valve is provided to close the tube when not occupied by the plunger, and the latter is projected by friction wheels on a long tail or shaft in the rear of the plunger.

Claim.—The application to and combination with vessels of otherwise ordinary or suitable construction of a mechanism for driving or thrusting shells or other explosive missiles against vessels or other bodies accessible by water and there by contact to explode; said mechanism being constructed and arranged to operate substantially in the manner herein set forth.

No. 37,943.—HIRAM BECKWITH, of Grass Lake, Jackson county, Mich.—*Improvement in Trimming or Cutting Bolts*.—Patent dated March 24, 1863.—This invention consists of a combined arrangement of a pair of jaws, with a semicircular recess and cutter in each, hinged together at the ends, the shorter one having attached to it a tongue which protrudes through a slot in the longer one giving attachment to a cam lever.

Claim.—The bars A C, provided with the semicircular recesses *e e*, and cutters G G, in combination with the link B, cam D, and lever E, all constructed and arranged as shown, to form a new and improved implement for the purpose specified.

No. 37,944.—HENRY J. BEHRENS, of New York, N. Y.—*Improved Marine Governor*.—Patent dated March 24, 1863.—The object of this invention is to make an ordinary pendulum or ball governor available for marine engines, and to arrange the same so that the rolling and pitching of the vessel has no disturbing influence on the action of the governor, by a universal or gimbal joint in a suitable frame so as to retain it in a vertical position.

Claim.—First, the combination with an ordinary pendulum or ball governor A of a universal joint or gimbal B C D, constructed substantially as herein described, for the purpose set forth.

Second, the arrangement of the three bevel wheels E F G with the driving shafts *j*, pivot *h*, and spindle *d*, of the governor A, when the latter is suspended from a universal joint or gimbal B C D, substantially as and for the purpose herein shown and described.

Third, so arranging the rising and falling rod *f* with the governor A, and universal joint or gimbal B C D, that the top of said rod coincides with the universal centre of the gimbal when the balls of the governor assume their mean position, substantially as and for the purpose specified.

Fourth, placing the rod *l*, which transmits the motion of the balls to the throttle-valve, loosely on the top of the rising and falling rod *f*, substantially as and for the purpose specified.

No. 37,945.—JOHN O. BLYTHE, of Philadelphia, Pa.—*Improvement in Lamp Burners*.—Patent dated March 24, 1863.—The improvement consists in the peculiar construction of the tube and its attached parts of a collar and tube plate, the burner projecting above the collar without perforations.

Claim.—The peculiar construction of the burner S, in combination with the collar F F, and tube plate *l l*, as combined with it (the tube) and attached to the screw in the top of the lamp, as shown in the drawing, or in figure No. 4; this burner having no perforations in its sides or wire cloth, and rising above the collar, and having a narrow flange turned over at the top with a screw cut upon it, as substantially described and set forth.

No. 37,946.—ADOLPHUS BONZANO, of Detroit, Mich.—*Improvement in Implement for Disabling Ordnance*.—Patent dated March 24, 1863.—This is a plug to be driven into the muzzle of a cannon having recesses with inclined bottoms arranged around its periphery, and with cutters and springs occupying said recesses so arranged that it will readily pass into the bore as the cutters are thereby pressed to the deeper portion of the groove, but cannot be retracted, as the act of drawing, in bringing the cutters firmly against the bore, raises them on the incline, and sinks them more deeply into the sides of the gun as the power to retract the plug is increased.

Claim.—The apparatus for disabling ordnance, composed of a block A, having grooves *c c*, with inclined bottoms, a series of cutters B B, fitted to said grooves, and a series of springs C C, applied to the cutters, the whole combined and operating substantially as herein specified.

No. 37,947.—EDWARD and JOHN BOURNE, of Pittsburg, Pa.—*Improvement in Dampers*.—Patent dated March 24, 1863.—This invention consists in passing a rod through the hinges of a stove door, occupying the place of its pintles, having a circular rack on the s ace between the hinges, which meshes into the toothed segment projecting from the periphery of

a circular damper, attached to the face of the door, so as to open and close the door or doors by the rod, and yet admit of their being opened otherwise without interfering with their mechanism.

Claim.—Moving the disks on the doors by means of the rod passing through their hinges, in combination with the frame thereof, in the manner as herein set forth.

Also, combining the disks with the rod by means of the toothed segments and the circular racks so as to admit of the doors being opened and closed without being affected by the mechanism of the parts.

No. 37,948.—ERNEST BREUL, of Hanover, Kingdom of Hanover.—*Improvement in Tobacco Spinning Machine.*—Patent dated March 24, 1863.—The object of this improvement is to save time, space, and labor in the operation of twisting tobacco by winding it up as fast as it is spun and twisted; this is accomplished by placing a revolving drum inside of a revolving frame and set at right angles to the latter, so that it presents its winding surface to the hollow mandrel which supports one end of the frame, and through which the tobacco leaves are passed to the guide roller which traverses on the screw-shaft, and from the roller to the drum on which it is wound.

Claim.—In combination with the revolving spinning frame, the revolving drum P, for spinning and winding tobacco, substantially in the manner and for the purposes set forth.

Also, in combination with a spinning frame and winding drum P, substantially as herein described, the screw shaft *x*, and guide roller F', when constructed and operated substantially in the manner and for the purposes herein set forth.

No. 37,949.—ALEXANDER BRESSWELL, of San Francisco, Cal.—*Bill-Holder.*—Patent dated March 24, 1863.—This bill-holder consists of a back and two flaps hinged together by elastic bands, which retain the flaps to the central portion and at the same time serve as springs to maintain the catch of one of them, in the recess formed by the bevel projection of the other, also to close the lid which may be lifted to examine the indorsed end of the bill.

Claim.—The plate F, with its bevel projection *f*, and lateral opening *e*, in combination with the plate G, with its tongue *g*, when used in connexion with elastic bands applied to a bill-holder, substantially as and for the purposes set forth.

No. 37,950.—E. H. CAMP, of Jackson, Mich.—*Improvement in Soldering Sheet Metal Eave Troughs.*—Patent dated March 24, 1863.—This is a clamping box of a semicircular interior form, in which the sections of trough may be brought together and clamped securely while being soldered; the edge is wound around the stiffening rod and placed within the recess, where the section to be operated upon is forced down to the shape of the semicircular box and retained there by a clamp which hooks over the edge; this is fastened by a tightening screw while the operation is performed.

Claim.—The semicircular box A, provided with rockers G G and bands B, curved at one end, as shown, to form recesses *a*, with a rod C secured to them, in combination with the straps D, arranged as shown, and adjusted by screws and nuts, or their equivalents, for the purpose specified.

No. 37,951.—P. A. CHADBOURNE, of Williamstown, Berkshire county, Mass.—*Improvement in the Manufacture of Paper Stock from Wood.*—Patent dated March 24, 1863.—The log to be operated upon is placed upon arbors in a horizontal position in a tank above it; suspended from a frame, is a vertically reciprocating gate; to the lower bar of this gate are two inverted U-shaped springs, to the lower end of which are attached files, rasps or scrapers, set obliquely with the line of their motion and shaving off the fibres of wood as they are driven up and down, and the log is rotated between them.

Claim.—First, the inclined reciprocating rasps, files or scrapers I, in combination with the rotating log J, placed between the centre points *c c'*, and within a cistern A, all arranged to operate as and for the purpose specified.

Second, the attaching of the rasps, files, or scrapers I to springs G, arranged substantially as shown, in relation with the log J, to insure the pressure of the rasps, files, or scrapers against the log at all times during the gradually diminishing diameter of the same.

Third, the combination of the crank shaft D, connecting rods E E, bar F, spring G, rasps, files, or scrapers I, screw K, rotating arbor M, from which the shaft D is driven by a belt P, the log J, and cistern A, all arranged for joint operation, as and for the purpose specified.

No. 37,952.—FRANCIS M. CHANDLER, of Buffalo, N. Y.—*Improvement in Apparatus for Folding the Plaits in Shirt Bosoms.*—Patent dated March 24, 1863.—It consists of a folding board with a raised edge on one side and a raised undercut ledge. A number of loose thin slats are provided, and the linen being lapped on one, its end is inserted under the ledge B, and its side against the edge A. The linen being folded back, a slat is dropped on the first and the linen folded forward over it. Another slat being dropped on it alongside of the two, the same operation is continued to form the series of plaits.

Claim.—The combination of the stop catch B and spring bar C, or either of them, with the plates and board, when arranged and constructed in the manner and for the purpose substantially as set forth.

No. 37,953.—PERRY DICKSON, of Utica, Winona county, Minn.—*Improvement in Converting Motion*.—Patent dated March 24, 1863.—This invention consists in an arrangement of dogs pivoted to a lever located within the rim of a wheel, which lever is vibrated by a reciprocating movement; by the movement in each direction one of the dogs is caused to bite the inside of the rim of the wheel and the other to be free from contact with it, and this alternate action causes a continuous rotary motion of the wheel. By a shifting arrangement the motion of the wheel is reversed.

Claim.—The employment, in combination with each other and the dogs *b b** and their carrying levers, of a pin *k* with cranks *i l*, a spring *f*, and a cord or chain *g*, the whole operating substantially as and for the purpose herein set forth.

No. 37,954.—WARREN W. DUTCHER, of Milford, Worcester county, Mass.—*Improvement in Roller Temples for Looms*.—Patent dated March 24, 1863.—The invention consists in extending the cap of the temple roller down across the inner end of the roller, and to a level with or into the trough thereof, and making the said trough with a closed inner end, so as to prevent the enclosed roller of the temple from injury arising from a blow of the shuttle; the two ends of both its trough and cap being closed and made in two separate parts connected by screws.

Claim.—In combination with the trough so made, and with the cap of the roller, the extension *b*, arranged so as to project downward from the cap and across the inner end of the roller, substantially as described.

Also, the improved temple, made not only with its cap and trough closed at both ends of each, but having such a trough formed in two separate parts and connected together by screws or their equivalents, as specified.

No. 37,955.—JACOB DUNTON, of Philadelphia, Pa.—*Improved Wagon for Transporting Medicines*.—Patent dated March 24, 1863.—The interior of the body of the wagon is occupied by boxes divided into drawers, and otherwise so arranged as to form convenient packages for transportation on pack-saddles.

Claim.—The subdivision of the body of a wagon or cart into a number of packages or compartments, so constructed and arranged that they will adapt themselves to the twisting and lurching of the wagon, preserve their contents from injury, and be capable of convenient transportation on the backs of animals, substantially as set forth.

No. 37,956.—M. B. DYOTT, of Philadelphia, Pa.—*Improvement in Lamp Cones*.—Patent dated March 24, 1863.—This invention consists in corrugating the side of the cone or deflector so that the chimney, which rests upon the base of the cone, cannot cover the apertures through which air is admitted to the flame.

Claim.—Corrugating or swaging the sides of the cone or deflector so as to form prominences or indentations, by which the necessary supply of air is prevented from being intercepted or cut off, whether admitted through perforations in the base of the cone or through air ducts formed by corrugations or prominences upon the base of the cone, substantially as and for the purpose above set forth.

No. 37,957.—RUDOLPH EICKEMEYER, of Yonkers, N. Y.—*Improvement in Sewing Machine Guides*.—Patent dated March 24, 1863.—This invention consists in devices to fold the edge of the band and put together and sew the crown piece and band of a cap or hat lining. It consists of a guide for folding the edge of the band and a circular rotating disk carrying the crown piece, with a sewing machine for fastening them together.

Claim.—First, the guide B C constructed with holes *d*, which are arranged in such oblique direction that they not only admit the finger and thumb to draw the band into the guide, but guide the finger and thumb in the proper direction to commence the turning of the fold, substantially as herein specified.

Second, the guide B C and rotating disk F combined with each other and with the sewing machine, substantially as specified.

No. 37,958.—JOHN EVANS, of New Haven, Conn.—*Improved Forge Fire*.—Patent dated March 24, 1863.—The invention consists of a hollow cold water chamber in front of the fire, whereby the smoke is deflected to the chimney flue and the gases condensed to add to the combustion.

Also, in the arrangement of hollow air chambers surrounding the fire with a current of cold air, which serves for the blast, and is so applied as to relieve the blacksmith from the radiated heat.

Claim.—First, the arrangement of the hollow water chamber front D in combination with the fireplace B of a Lehigh fire A, constructed and applied substantially as and for the purpose set forth.

Second, the arrangement of the air chambers G G' in combination with the fireplace B of a Lehigh fire A and communicating with the air-supply channel *j* and discharge pipe or tuyere *m*, the whole being constructed and operating substantially as and for the purpose specified.

No. 37,959.—GEORGE W. FULLER, of Cambridgeport, Mass.—*Improvement in Submarine Lanterns*.—Patent dated March 24, 1863.—The air is admitted to this lantern by an induction tube under pressure, so as to prevent the breaking of the glass by the weight of the column of water, and also to prevent leakage of water into the lantern. The water that may leak in is collected in a reservoir at the bottom, and not allowed to come in contact with the heated chimney to be vaporized and dim the light; besides which there are many other points of adjustment specified at length in the claim.

Claim.—A lantern as made or provided with an air induction conduit, and with a valve opening and valve arranged with respect to the body of the said lantern and for the purpose of supplying air to the lamp thereof, and of discharging the smoke and spent products of combustion into the water, when the lantern may be submerged therein, as specified.

Also, the combination for applying the glass window *b* to the body *A* of the lantern, and so as to enable such window not only to be closed with a water-tight joint, but to be opened on a hinge for the purpose as described, the same consisting of the rings *c d*, the hinge and the sections of screws connected with or applied to the rings and the lantern case, substantially as specified.

Also, the combination and arrangement of the air-ventilating devices *N O*, and their screw stoppers or their mechanical equivalents, with the lantern body or case, the same being for the purpose set forth.

Also, the arrangement or combination of the air inlet or inlets *g* with the lamp and glass window, in manner so that the air forced into the lantern case may be, on its entrance therein, discharged either against the inner surface of the glass window, or upward between the same and the flame or chimney of the lamp, the same being for the purpose hereinbefore set forth.

Also, the combination and arrangement of mechanism for raising the glass chimney and the conical deflector, in order that access may be had to the wick, the same consisting of the frame *u*, the forked lever *a'*, and the connecting bars *z z*; the said frame *u* being provided with guides, as specified.

Also, the arrangement of the mariner's compass, viz: within the lantern body and with respect to the lamp and the window of the said body or on the lever *a'*, as specified.

Also, the combination and arrangement of the water-receiving and guard chamber *R* and chimney cap or dome *Q* with the opening *P* and the valve seat *S* and valve *T* applied or arranged with respect to the lamp, and the lantern body, substantially as specified.

Also, the combination of the check nut *W* with the handle *X*, the cap *V*, and the screws by which the latter is connected to the upper part of the lantern case.

No. 37,960.—FRED. T. GRANT, of Augusta, Maine.—*Lathe for Turning Irregular Forms*.—Patent dated March 24, 1863.—This invention consists in providing a hollow mandrel with a cutter or knife that shall expand or contract, so as to turn a stick of an irregular form, the knife travelling around the stick while the latter is held and fed endwise through the hollow mandrel, the knife being operated by a sliding collar and cam.

Claim.—The sliding collar *a*, or its equivalent, operated by a cam *j*, or its equivalent, to operate the knife *d* in any way or manner that it may be attached to sliding roller *a*, as specified and set forth.

Also, the whole principle of the sliding collar *a* in any manner that it may be moved, as specified, and in any way or manner that it may be attached to the expanding knife *d*, as is set forth, and for the purpose specified.

Also, the V-shaped feed rolls *k k*, when combined with the double-acting lever *e*, as set forth, and for the purpose specified.

Also, the mode of fastening the knives *d b*, as set forth and specified.

No. 37,961.—ALBERT HALL, of Danville, Des Moines county, Iowa.—*Improvement in Revolving Fire-arm*.—Patent dated March 24, 1863.—The improvement in this fire-arm consists in the construction of the lock; the suspended sere; the stop dog, operated through connexions by the hammer; the rotating lever, operated by the rear downward extension of the hammer, and through a slot in the recoil shield; in the movable plate at the front of the cylinder, to admit of the chambers being loaded at that end, and confining the loads when there; and in a provision at the lower end of the recoil plate for the expulsion of the exploded percussion primers in the act of reloading the chambers.

Claim.—First, the suspended sere *I*, constructed and arranged in combination with the hammer and trigger, substantially as herein specified.

Second, the stop dog *y*, arranged in rear of the cylinder within the frame, and combined with the hammer by means of hooks *y²* and *z*, substantially as herein described.

Third, the lever *K*, constructed and applied in relation to the cylinder and combined with the pin *h* and with the extension *F²* of the hammer, substantially as and for the purpose herein specified.

Fourth, the combination with the so-constructed and applied lever *K* of the bevel *x*, at the bottom of the slot *w*, in the recoil shield or frame, through which the said lever works, substantially as and for the purpose herein specified.

Fifth, the plate *L*, constructed and applied in combination with the barrel and cylinder, substantially as and for the purpose herein specified.

Sixth, the hole *16* in the recoil shield below the frame, arranged in combination with the opening in the plate *L*, substantially as and for the purpose herein specified.

No. 37,962.—WILLET HICKS, of Trenton, N. J.—*Improved Fruit Jar*.—Patent dated March 24, 1863.—This invention consists in a suspended stopper within the neck of the jar. The cork has a washer above and below, and a hook by which it is suspended from a cross-bar on the top of the jar; above this cement is poured on, and the whole prevented, by the hook and cross-bar, from being driven into the jar under pressure of the atmosphere, resulting from the cooling of the contents.

Claim.—First, the use of the washers, centreport, or standard cross-bar, &c., for the purpose of preventing the cork and cement from being forced, by the pressure of the atmosphere, into the body of the jar, can, or jug.

Second, the use of the said washers, centreport, or standard, with eye, cross-bar, &c., for the purpose of more easily extracting the stopper from the mouth of the can or jar, substantially as described.

No. 37,963.—WARREN G. HOAG, of Hoosick, Rensselaer county, N. Y.—*Improvement in Grain Screens*.—Patent dated March 24, 1863.—The uncleaned seed falls from a hopper upon an inclined screen in a shaking shoe. This first screen has oblong meshes, and below it is a parallel screen with square meshes, and under this is a board, from the end of which it passes to another screen inclining in a different way, on which the seed is parted by diverging boards, and discharged at two spouts.

Claim.—The arrangement of the screens A C E and guiding boards *b d D* and delivery points *a c e* in a frame having a shake motion, for the purpose of cleaning and separating flax and other small seeds, substantially as herein described and represented.

No. 37,964.—HENRY HOLCROFT and C. S. SMITH, of Media, Delaware county, Pa.—*Improvement in Potato-Diggers*.—Patent dated March 24, 1863.—The potato forks or diggers are attached to a revolving drum, and so operated by cams as to strike into the ground and raise and retain the potatoes, which fall into the inside of the drum, the latter being divided by four perforated partitions, the dirt finding its way from the drum through the perforations and between the teeth to the ground, while the potatoes are discharged into a receiver under the double tree.

Claim.—First, the arrangement of the sifting drum D with the perforated partitions *c* and rotary digging teeth *g*, constructed and operating in the manner and for the purpose herein shown and described.

Second, the arrangement of the adjustable cam E, in combination with the stationary cam G, toes *h*, and digging teeth *g*, constructed and operating substantially as and for the purpose herein specified.

Third, the arrangement of the sifting drum D with perforated partitions *c* and self-adjusting rotary digging teeth *g*, in combination with the receiving box H, constructed and operating substantially as and for the purpose set forth.

No. 37,965.—GEORGE C. HOWARD and ISAAC N. WILFONG, of Philadelphia, Pa.—*Improvement in Hay-elevating Forks*.—Patent dated March 24, 1863.—This consists of a rake head furnished with teeth and an arm or handle. The rake is swung from a bail by eye bolts in the head, and maintained in its loading position by a catch on the sliding cap, which terminates the arm; the sliding of the cap by a rope releases the catch, and the load falls.

Claim.—The cap E, formed and adapted to the stem A, and arranged for being locked to and unlocked from the bail, substantially as described, in combination with a spiral spring F, contained in a recess formed in the said stem, the whole being arranged and operating substantially as and for the purpose herein set forth.

No. 37,966.—JAMES R. HYDE, of Troy, N. Y.—*Improvement in Stoves*.—Patent dated March 24, 1863.—A boiler is suspended by metallic straps inserted into openings in the projecting flanged top at the rear of the stove.

Claim.—A stove having a boiler A suspended, with one upright side against the upright rear end B of the stove, by means of hangers *e e* extended up rigidly from the boiler and loosely engaged with the ordinarily projecting part *c* of the top plate D of the stove at places *g g* above the top *f* of the boiler, and over the side or portion thereof nearest to the stove, substantially as and for the purpose herein described and set forth.

No. 37,967.—MOSES A. JOHNSON, of Lowell, Mass.—*Improvement in Covering for Steam Boilers*.—Patent dated March 24, 1863.—This improvement consists in impregnating and covering felt, whether made of hair or other material, with silicate of soda or soluble glass to render it incombustible and a better non-conductor.

Claim.—The impregnation and coating of felt with silicate of soda, substantially as and for the purpose herein specified.

No. 37,968.—GEORGE L. KING, of Philadelphia, Pa.—*Machine for Dovetailing and Relishing Sash*.—Patent dated March 24, 1863.—The invention consists in a machine for dovetailing and relishing sash at one operation by means of circular saws, arranged and

operated in the standing frame of the machine, two on one vertical shaft, one to cut the lower side of the female dovetail on the stiles, and the other to cut the relish, the saw on the other and inclined shaft cutting the upper side of the dovetail and taking out the superfluous wood left by the first-mentioned saw.

The stuff is presented to the saws on a sliding table with a guard, against which the stiles are placed, having adjustable gauges for regulating the length of the dovetails.

Claim.—First, cutting a perfect female dovetail and relish with saws at one operation, substantially in the manner described.

Second, cutting a perfect male dovetail with saws at one operation, substantially as set forth.

Third, arranging the frame G which supports the saw shafts F to turn on a centre, so as to bring the saw at an angle with the stuff to cut the bevel side of the female dovetail, substantially in the manner described.

Fourth, combining and arranging the transom plate H with the frame G when operating, substantially as and for the purpose set forth.

Fifth, the combination and arrangement of the reversible guard P and arms *t* and *t'* with the sliding table N, when arranged in the manner described, or in any equivalent manner to produce the same effect, for the purposes set forth.

No. 37,969.—PERIES LINCOLN, of Cold Water, Branch county, Mich.—*Improvement in Wheels for Harvesters.*—Patent dated March 24, 1863.—The object is to obtain a revolving rim, which may admit of the passage of the finger-bar through it. It rotates upon rollers on stationary arms in the centre.

Claim.—The peculiar arrangement and combination of rollers D D D D D with the stationary arms B B B B B, and revolving rim with flange C and A, as set forth.

No. 37,970.—ALBERT MOORE, of San Francisco, Cal.—*Improvement in Picks or Axes.*—Patent dated March 24, 1863.—This pick has a stud, which projects into a socket on the end of the handle and is retained there by a pin.

Claim.—The pick *a*, with the projecting piece *b*, the socket *d*, and key *f*, constructed, combined, and arranged as herein set forth.

No. 37,971.—L. H. OLMSTEAD, of Yonkers, West Chester county, N. Y.—*Improved Ratchet Brace.*—Patent dated March 24, 1863.—This brace consists of a handle and pawl rotating a drill by means of a ratchet wheel on the drill stock.

A pintle for the upper bearing of the stock makes a bearing for a collar, to which is attached a stud which, passing through the shank of the lever, forms a pivot for the pawl.

Claim.—First, the arrangement and combination of the dog *b*, pivot *a*, stop *c*, handle F, and serrated wheel E, all constructed and operating substantially as and for the purpose shown and described.

Second, the arrangement of the clamp G in combination with the stud *d*, or its equivalent, and with the nut or screw D of a ratchet brace, constructed and operating substantially as and for the purpose specified.

No. 37,972.—JOHN C. PARK, of Buffalo, N. Y.—*Improvement in Welding and Repairing Railroad Bars.*—Patent dated March 24, 1863.—The portions to be welded, or the part to be straightened, is laid upon a bed-plate and against a die; a ram of the proper shape is then violently thrust against it by means of a piston from a steam cylinder.

Claim.—The machine for welding or repairing railway bars, composed principally of a block or bed-plate A, a die B, a ram C, a piston F, and a steam cylinder L, the whole combined to operate substantially as herein set forth.

No. 37,973.—ARTHUR PELL, of New York, N. Y.—*Improvement in Gimlet.*—Patent dated March 24, 1863.—This pocket gimlet has a ring on the end of its shank, by which it is fitted on a tube as a cross handle, which forms a case into which it is screwed when out of service.

Claim.—A pocket gimlet composed of the tube D, and a gimlet provided with a head or knob C at the end of its shank A, the knob having a hole or opening *a* made through it to receive the tube D when required, and provided at its inner end with a screw *b* to fit when required into an internal screw *c* in the open end of the tube D, all constructed and arranged as described.

No. 37,974.—JOHN G. PERRY, of South Kingstown, Washington county, N. Y.—*Improvement in Straw-Cutters.*—Patent dated March 24, 1863.—The spiral cutting blades are fixed to arms which rotate in connexion with the face of a smooth cylinder above them.

Claim.—The combination of the smooth cylinder C, with the cylinder E, having a knife or knives arranged as herein described and for the purposes set forth.

No. 37,975.—JULIUS G. POHLE, of Morrisania, West Chester county, N. Y., and JAMES N. CROW, of Mott Haven, West Chester county, N. Y.—*Improved Mode of Removing Stains*

from Glass.—Patent dated March 24, 1863.—The invention consists in applying hydrofluoric acid in a liquid state to glass to remove the iridescence or “stains,” by removing the surface so far as to prevent the refraction of the rays.

Claim.—The application of the within-described solution for the purpose of removing or eradicating stains or burns from glass substantially in the manner set forth.

No. 37,976.—**ULYSSES PRATT**, of Deep River, Middlesex county, Conn.—*Machine for Planing and Dressing Ivory.*—Patent dated March 24, 1863.—The slabs are placed in a hopper, and fall one at a time into a recess on the upper side of a reciprocating bed, and being drawn out are exposed to the action of rotary cutters, which plane them to the required shape and roughen them for attachment to the keys.

Claim.—First, the combination of the rotary cutters D E, and reciprocating bed G, the latter being provided with a recess K, having an inclined bottom a^* , all arranged to operate as and for the purpose herein set forth.

Second, the hopper M, in combination with the rotary cutters D E, reciprocating bed G, provided with the recess K, and the taper or wedge-shaped block O, all arranged substantially as and for the purpose herein specified.

No. 37,977.—**HENRY PRESTON** and **JAMES MAHOOD**, of Philadelphia, Pa.—*Improved Milk Can.*—Patent dated March 24, 1863.—The improvement consists in constructing each of the bands of a milk can in a solid single piece of thick tin plate, and securing the whole of its interior surface to the exterior of the vessel, with the ends riveted.

Claim.—As an improved article of manufacture, milk cans having the single, solid, tin plate bands a^2 , the said bands being constructed, applied, and secured to the vessel A in the manner described and set forth, for the purposes specified.

No. 37,978.—**BARNARD REGAN**, of Miamisburg, Ohio.—*Improvement in Seed Drills.*—Patent dated March 24, 1863.—The improvement is in the seed wheel, which consists of a pair of disks with oblique teeth and depressions and a collar between them. The seed is thrown over an oblique edge into the delivery tubes.

Claim.—First, the combination of the oblique grooves $d d$ and ridges $e e$ of feed-wheel D with the oblique sill c of delivery opening E substantially as and for the purpose described.

Second, separating the transverse sections of feed-wheel D by a washer w or washers; or what is equivalent thereto, forming notches $n n$ in ridges $e e$ of the same; substantially as and for the purpose set forth.

No. 37,979.—**BENJAMIN S. ROBERTS**, U. S. Army.—*Improvement in Projectiles for Rifled Ordnance.*—Patent dated March 24, 1863.—The projectile consists of two parts, the larger portion at the front, being of cast-iron, and at the rear, a cup-shaped portion of soft metal. A little forward of the centre of gravity of the shot, a shoulder is formed on the iron portion, from which point it is reduced toward the rear, assuming a paraboloid form and embraced by the cup of the rear portion. This rear portion is driven firmly upon the spindle by the act of firing, and has tongues which cause the embracing portion to expand into the rifles of the gun.

Claim.—In a projectile for rifled ordnance composed of a body of cast-iron, and a cup or band of soft metal and having upon its body a shoulder running transversely around the same and a spindle furnished with longitudinal tongues and grooves, first, constructing the projectile of such proportions that the soft metal shall so embrace the centre of gravity of the entire projectile as to furnish a bearing for the same, while passing through the cannon, substantially in the manner and for the purpose above described.

Second, in a projectile constructed as described in the preceding claim, further, forming the surface of the spindle in the shape of a paraboloid or such an approximation thereto that the soft metal may by the force of the explosion be crowded uniformly outwards on all sides and at all parts of its length whereby the axis of the projectile may be placed and held firmly in the axis of the cannon while passing through the same, thereby securing a steady motion of rotation to the shot through its flight, substantially as and for the purpose above described.

No. 37,980.—**C. B. RICHARDS**, of Hartford, Conn., assignor to **C. E. PORTER**, of New York, N. Y.—*Improvement in Steam Engine Indicator.*—Patent dated March 24, 1863.—The lever, which is pivoted to and actuated by the piston rod, is connected to a lever whose centre of vibration is on the indicator rod; this vibrating arm is again connected to another lever of the same length as the first, so that the attachment of the piston rod being nearer the point of permanent attachment than to the rocking lever, the latter is moved more than the piston, and in a straight line, as it is attached to levers of equal length by each end.

Claim.—The means substantially hereinbefore described for giving to the marking point a range of motion greater than that of the piston by which it is actuated, in combination with the described means or an equivalent therefor by which the marking point is caused to travel in a straight line; substantially as and for the purposes hereinbefore specified.

No. 37,981.—**GEORGE ROSS**, of Newport, Ky.—*Improvement in Patterns for Moulding Pipes.*—Patent dated March 24, 1863.—This invention is applied to the pattern used in moulding pipes so as to strengthen them in those places where they are to be tapped for

branch pipes. This is done by making a sectional ring which can be expanded at the point desired by means of a conical plunger, and drawn back again so as to permit the pattern to be withdrawn from the sand.

Claim.—First, the application to the pattern A of a movable sectional ring B, or its equivalent, capable of being pushed out and drawn in while the pattern is in the sand, in the manner and for the purpose substantially as specified.

Second, the arrangement of the rising and falling conical plunger D, and springs C, in combination with the studs *d* and sectional ring B, constructed and operating substantially as and for the purpose shown and described.

No. 37,982.—EDWARD SAUER, of New York, N. Y.—*Improved Press for Bending Ships' Armor-Plates.*—Patent dated March 24, 1863.—This machine consists of a bed and platen, the latter sustained above the bed by supporting screws and steadied by guide rods. Projecting upwards from the bed are dies adjustable vertically by screws, and the platen also has suspended dies of the same character, so that by the proper disposition relatively of the series of upper and lower dies, any required contour may be given to the interposed plate. The platen is drawn down toward the bed by means of nuts on pin-jointed bolts hinged to the bed, which fit in slots on the edge of the platen, and are vibrated to a horizontal position to place the plate in the press or withdraw it therefrom.

Claim.—The combination with each other and with the bed A, and platen or follower B, of the two sets of dies F F and G G, constructed as described and separately adjustable both bodily and at either end, substantially as and for the purposes herein specified.

Also, combining the bed A, and platen or follower B, to which such dies F F and G G are attached, by means of hinged or pin-jointed bolts D D, substantially as and for the purpose herein specified.

No. 37,983.—JOHN W. SCHREIBER, of New York, N. Y.—*Improvement in Coal-oil Lamps without Chimneys.*—Patent dated March 24, 1863.—The improvement is in the wick tube and jacket. The former has a rounded top, and the latter is perforated, and its flame-slit narrowed in the middle.

Claim.—The combination of the rounded top wick tube *c*, and the perforated jacket *b*, when the latter is provided with a slot or opening *h* in its top, having its central part narrower than at its ends, as herein set forth.

No. 37,984.—GEORGE SMILLIE, of New York, N. Y.—*Improved Green Ink.*—Patent dated March 24, 1863.—Take one part, by weight, of asbestos, and two parts of chromium, as a basis, and mix with oil to form ink for steel plate printing; the color and consistency varying by the proportions of the materials and the unctuous character derived from the asbestos. The object is to obtain an impalpable and indestructible material that will not grind the face of the plate, nor be obliterated by re-agents.

Claim.—A printing ink having for its basis a compound of chromium and asbestos or other analogous and suitable material as herein described.

No. 37,985.—MERVIN R. SMITH, of Armonck, West Chester county, N. Y.—*Improvement in Sewing Machines.*—Patent dated March 24, 1863.—This machine is constructed to sew equally well whichever may be the direction of the revolution of the driving shaft, and to reverse the feed by the reversal of the movement of said shaft without any other changes of adjustment. The improved device consists in the construction of the needle-operating cam, the feed mechanism, and the shuttle-operating mechanism, which are clearly defined in the claim. Also, in isolating that portion of the bed which contains the raceway, so as to allow the work to pass around it; and in the construction of the shuttle, by which the thread is passed through an elastic spring slide on a guide bar in the shuttle, to bring a uniform strain upon the thread.

Claim.—First, the combination of the needle-operating cam G, constructed as described, the shuttle-driving eccentric J, and the feed lever H, having an elongated slot *n*, fitted with a slide *p*, and deriving a positive motion in both directions from a crank wrist *k*, the whole arranged and operating substantially as set forth to cause the machine to operate with the driving shaft or pulley rotating in either direction, and the feed to be reversed by reversing the direction of the said shaft or pulley.

Second, the combination with each other and with the isolated portion of the flat bed constituting a cylinder, or its equivalent, of the shuttle-driving eccentric J, rod M, rock shaft L, arm N, rod P, and feed-operating crank wrist *k*, the whole arranged and operating substantially as and for the purpose herein specified.

Third, the slide *y*, guide bar *w*, and spring *z*, combined with each other and the shuttle, substantially as and for the purpose herein specified.

No. 37,986.—CHARLES F. SPENCER, of Rochester, N. Y.—*Improvement in Coal-oil Lamps.*—Patent dated March 24, 1863.—The deflector is secured to the plate on which the chimney stands, the latter being attached to shanks which pass into guides on the wick tube. When down, the chimney gallery sets on the flanged support, but when raised so that the shanks traverse in the guides, it may be vibrated over to expose the wick for dressing and renewal.

Claim.—Connecting the deflector and chimney with the wick tube or cap, by means of the sliding shank *b*, secured to the guide *G*, or its equivalent, in such a manner that the shank is held firmly in place when lowered, but forms a joint when raised, so as to turn vertically the chimney and deflector back; the whole arranged, combined and operating substantially as herein set forth.

No. 37,987.—ABNER G. TISDEL and WILLIAM NASH, of Watertown, Jefferson county, N. Y.—*Improved Attachment for Converting Burning Fluid into Coal-oil Lamps.*—Patent dated March 24, 1863.—This consists of a clamp or collar to be attached to the wick tube of an oil or alcohol lamp having prongs rising from it terminating in perforated caps on each side of the flame.

Claim.—The two prongs *A A*, provided at their upper parts with perforated cap-shaped terminals and slotted at their lower parts to form arms *b*, which are connected to a suitable clamp, all arranged as and for the purpose herein set forth.

No. 37,988.—P. C. VAN BROCKLIN, of Buffalo, N. Y.—*Improvement in Cultivators.*—Patent dated March 24, 1863.—The triangular frame of this cultivator is supported upon a wheel at each corner; the forward wheels being pivoted in arms projecting downwardly from the frame, and the socket of the rear caster wheel pivoted so as to be vibrated back and forth by the lever, with connecting rods to lower the frame at all corners simultaneously.

Claim.—Cultivators having a triangular frame with a wheel at each corner, supporting a caster wheel at the apex of the frame, in a socket or journal box which is hung upon a bolt or pin, in such a manner that it may turn or swing freely upon said bolt, in combination with a swivel lever shaft which connects with the wheel and extends upwardly for a handle, and operates as a swivel upon which the wheel turns freely, and which is connected with the forward wheels by means of rods, taking hold of the arms *I* below the frame, so that all of the wheels may be raised or lowered simultaneously by the driver, substantially as and for the purposes described.

No. 37,989.—CHARLES VAN DE MARK, of Oaks Corner, Ontario county, N. Y.—*Improvement in Portable Fences.*—Patent dated March 24, 1863.—The adjacent ends of the worm fence panels are interlocked with each other by the protrusion of the three middle boards with a slat attached, through a gap made by the cutting away of the three middle boards between the two slats at the end of the other panel. The cleats on these ends lock against the contiguous surfaces, and the corners are braced by inclined slats.

Claim.—Interlocking the panels by means of the cleat *d*, or its equivalent, on one panel, abutting against the cleat *b* and the top and bottom rails of the other panel; either with or without the other abutting cleats *c a*, substantially as and for the purposes herein specified.

Also, the brace *G*, constructed and arranged substantially as specified, in combination with the construction and arrangement of the panels as described.

No. 37,990.—GUSTAV WEDEKIND, of Philadelphia, Pa.—*Improvement in Clasps for Paper Shade Holders.*—Patent dated March 24, 1863.—The upper edge of the paper shade is inserted within the ring or clasp and the clips punched down upon it.

Claim.—The making of the clips at the top and inside of the ring so as to clasp the shade inside of the ring, in the manner and for the purpose herein described and represented.

No. 37,991.—JOEL WHITNEY, of Winchester, Mass.—*Improved Machine for Rolling Green or Wet Leather.*—Patent dated March 24, 1863.—This invention consists in a rolling machine for expressing the liquor out of wet leather preparatory to splitting it, an elastic pressure being brought upon the leather by means of a yielding material beneath their journals, and the rollers themselves being covered with an elastic casing. The upward pressure of the elastic bearings of the lower rollers is increased by weights on the treadle communicated by levers, &c., to the box in which the cushion is placed, and the pressure of the upper rollers regulated by the geared screw arrangement on the top of the standards.

Claim.—First, the combination of the rollers *B B P P*, shaft *c*, and screws *a a*, with the devices *g i h j l k m p*, in the manner described for the purpose of producing the effect described upon wet leather.

Second, hanger *j*, cap *i*, box or cylinder *h*, and spring *q*, in combination with the roller *B*, in the manner and for the purpose described.

Third, the combination of the levers *k k*, links *m m*, and treadle *p*, with the hanger *j*, of the cap *i*, in the manner and for the purpose described.

Fourth, the combination in a wet leather rolling machine of the spring *g*, lever arrangement *k l m p*, and geared screw arrangement *c e e b b a a*, in the manner and for the purpose described.

No. 37,992.—SAMUEL R. WILMOT, of Brooklyn, N. Y.—*Improvement in Apparatus for Clasping Skirts.*—Patent dated March 24, 1863.—The clasps are placed in the hopper and fed down the channel ready for insertion into the tape, which is performed by the descending hammer.

The percussion jolts the clasps in their reservoir so as to be ready for transmission into the channel, and the hammer is moved by means of a treadle.

Claim.—First, the interposition of a spring N between the shaker E e and the concussive portion of the machine as represented.

Second, the projections K K, and the recesses K' K', and spring P, arranged to operate relatively to the supporting piece I i, or its equivalent, substantially as and for the purpose herein set forth.

Third, the projections L L, and the recesses L' L', and spring P, arranged to operate relatively to the supporting piece L i, or its equivalent, substantially as and for the purpose herein set forth.

No. 37,993.—ROBERT T. WILDE and SAMUEL H. LYON, of Brooklyn, N. Y.—*Improvement in Dies for forming Hats.*—Patent dated March 24, 1863.—This invention is applied to form hats of a bell crown shape, and the die is made expansible by means of cams and crank so as to be made to assume the shape required while the hat is being formed upon it, and reduced again to a cylindrical form for withdrawal from the hat.

Claim.—First, the combination of a fixed bottom-piece A a fixed top-piece, C, and a series of interposed expanding pieces D D E E, the whole constructed and arranged to operate substantially as herein specified for the purpose set forth.

Second, so combining the several expanding pieces D D E E with each other and with a cam H attached to the die or block, that the said pieces may be operated simultaneously as herein described, to produce the contraction and expansion of the die or block without the removal and re-insertion of any portion of the die or block.

No. 37,994.—STEPHEN W. WOODWARD, of Buffalo, N. Y.—*Improved Clothes-Ironing Machine.*—Patent dated March 24, 1863.—This machine consists of a hollow metallic table heated by gas or otherwise, and a smoothing iron at the end of a reciprocating arm, which is worked by machinery.

Claim.—First, the hollow metallic table B, when heated by a flame of gas or spirit lamp, and constructed and used for the purpose of ironing clothes thereon, as described.

Second, operating the smoothing iron E, by means substantially as described, in combination with the hollow metallic table B, for the purposes set forth.

No. 37,995.—W. A. WOOD, of Hoosick Falls, Rensselaer county, N. Y.—*Improvement in Dividers for Harvesting Machines.*—Patent dated March 24, 1863.—The upper and under portion of the shoe are not united at the front, and have an enlarged space over and behind the finger bar to enable the sickle to carry out all matter that may lodge on the shoe, such as dead grass, mouse-nests, &c.

Claim.—An outside shoe or divider having an enlarged open space over and behind the finger bar, to which it is fastened, and the upper and under portions of whose front approach each other near enough for the cutter to pass through without being united, substantially as and for the purpose herein described.

No. 37,996.—NATHAN AMES, of Saugus Centre, Mass.—*Improvement in Needles.*—Patent dated March 24, 1863.—The eye of the needle is provided with a lateral slot so bevelled as to facilitate the entrance of the thread and prevent its escape, and also to offer no impediment to the use of the needle. The strength of the eye is preserved by making it thicker at the side opposite the slot.

Claim.—A needle made with a lateral bevelled opening into the eye, and an increased thickness of metal on the side of the needle opposite the opening, all as herein shown and described.

No. 37,997.—ALEXANDER BAIN, of New York, N. Y., assignor to Himself and WILLIAM H. ALLEN, of same place.—*Improvement in Electric Telegraphs.*—Patent dated March 24, 1863.—This invention consists in a rotary finger plate that makes and breaks the electrical circuit, and by means of an electro-magnet gives motion to a hand that indicates upon a dial the motion or signs transmitted; also, in movable indicating dials that can be varied in the order of the lettering or figuring, to render unintelligible the message, except by mutual agreement of the dials of the sender and receiver.

Claim.—First, the finger plate provided with the cavities or holes corresponding with the sign to be transmitted, said plate in its revolution making and breaking the electrical circuit, substantially as set forth.

Second, the stop C in combination with the said finger plate, for the purposes and as specified.

Third, the dial m and hand n, actuated substantially as shown, in combination with said finger plate, for receiving the message, as specified.

Fourth, the movable dials or rings applied to the transmitting and receiving instruments, whereby the telegraphic communication can only be understood by the sender and receiver, as set forth.

Fifth, the finger plate supported at or near its circumference, so that the interior of said finger plate may be open for exhibiting the dial m and hand n, as set forth.

No. 37,998.—WILLIAM B. BARNARD, of Waterbury, New Haven county, Conn., assignor to Himself and SAMUEL G. BLACKMAN, of the same place.—*Improvement in Coppering Iron Vessels*.—Patent dated March 24, 1863.—This improvement consists in the use of a varnish or other insulating material applied between the hull and the sheathing, when the latter is attached by rivets in enlarged cavities in the hull.

Claim.—The combination of Japan varnish, or any other suitable insulating substance or material, with the copper sheathing of an iron or iron-plated vessel, when said sheathing is attached to the vessel by means of metallic rivets, secured within enlarged cavities formed in the iron work of the hull of said vessels, substantially in the manner and for the purpose herein set forth.

No. 37,999.—ERASTUS W. BATES, of Waterville, Kennebeck county, Maine, assignor to JOHN ELLIS, of North Bridgeport, Mass.—*Improvement in Wood-saw Frames*.—Patent dated March 24, 1863.—This improvement is a method of tightening the frame of a "buck" saw to strain the blade, and consists of a lever and cam, drawing upon a link attached to the lightning rod, and working in indentations on the shorter member of the saw frame.

Claim.—The combination of the strap E pivoted to the base D, the lever G, with its cam *f* pivoted to the strap, and the plate I, with its indentions *i*, applied to the head of the bar B, in the manner specified.

No. 38,000.—GEORGE W. BIGELOW, of New Haven, Conn., assignor to H. B. BIGELOW, of same place.—*Improvement in Rifling Machines*.—Patent dated March 24, 1863.—The invention consists in a combination of parts, whereby the mandrel is caused to rotate on its axis during the passage of the barrel; this is accomplished by means of a tripping lever and connecting rods, which actuate a vertical rack meshing into a pinion on the mandrel shaft.

Claim.—The combination of the cross-head trip *i* and lever *d* with the rack N and pinion O, when the same are combined to operate substantially as and for the purpose specified.

No. 38,001.—PETER BUDENBACH, of New York, N. Y., assignor to E. R. BENNETT, of same place.—*Improvement in Coal-oil Lamps for Locomotives*.—Patent dated March 24, 1863.—Below the outer tube of the lamp extends a cylindrical chamber with perforated sides and bottom, in which the guide-rod extension of the wick raiser projects. A space intervenes between the outer tube of the lamp and the wick tube, in which the wick raiser traverses, and which is connected with the oil supply; within this wick tube is a sliding tube, to which, by bridges, is attached permanently a rod, on the summit of which is a button to deflect the flame, so that, by the raising or lowering of this inner tube, the button is adjustable to the flame; over the oil chamber extends a circular cap or bridge with perforated sides and with a flame orifice. In the wick chamber above the pinion, which operates the wick raiser, is an annular diaphragm, which prevents the wick or other matters reaching the part of the tube occupied by the pinion.

Claim.—First, attaching the button I to a sliding tube G, which is fitted within the tube E, all arranged as shown, to support the bottom in proper position, and admit of the ready adjustment of the same as set forth.

Second, the perforated cylinder B, attached to the lower end of the outer tube A of the lamp, when said cylinder is made to project below said tube and form an extension of the same, as and for the purpose set forth.

Third, the bridge in the oil-chamber K, formed of the curved top plate *c*, and perforated sides *d d*, and provided with a perforated cylinder M, any one or all of the perforated parts being used as and for the purpose specified.

Fourth, the perforated partition plate J, in the wick chamber *b'*, as and for the purpose set forth.

No. 38,002.—THOMAS D. BURRALL, of Geneva, Ontario county, N. Y., assignor to WILLIAM D. BURRALL, of same place.—*Improvement in Corn Shellers*.—Patent dated March 24, 1863.—The invention consists in providing the circular tube, through which the ear of corn is conveyed to the toothed disk, with a recess in which is fitted a spring to crowd the ear against the sheller.

Claim.—The circular hopper *e*, provided with a recess for receiving the curved spring *o*, in the manner and for the purposes specified.

No. 38,003.—S. W. KIRK, of Coatesville, Chester county, Pa., assignor to Self and E. C. STOTSENBERG, of Wilmington, Del.—*Improvement in Purifying Cast-iron*.—Patent dated March 24, 1863.—The invention consists in the use of binoxide or hyperoxide of manganese, applied to the iron while the latter is in a state of fusion.

Claim.—The use of the binoxide or hyperoxide of black manganese, with or without the addition of the sesquioxide of iron, introduced to the iron when the iron is perfectly fluid, for the purpose of washing out the impurities, substantially in the manner and for the purpose set forth.

No. 38,004.—C. W. THEO. KRAUSCH, of Chicago, Ill., assignor to Self and ROBERT McCABE, assigns to said KRAUSCH and DAVID HOWES, of same place.—*Improvement in Grain Elevator*.—Patent dated March 24, 1863.—This improvement consists of a series of elevating screws in suitable tubes by which the contents of the boat or car are raised and discharged into the warehouse, and thence transported to the upper floors. The swinging tube is connected to the second tube by means of a connecting arm, so that their relative distance is maintained, and the gearing on the end of each, which drives the screw, is caused to rotate simultaneously by a band connecting a pulley on each. The grain at the summit of the swinging tube is received by a bonnet, which discharges it into a spout, from whence it passes to the second elevator.

Claim.—First, providing the tube E with a receiving and discharging bonnet E', substantially as and for the purpose set forth.

Second, so connecting the receiving swinging tube E with the stationary tube B, that a revolution may be simultaneously imparted to the screws of both tubes, and such motion continued whether the tube E be elevated or depressed, or swung out from or swung in toward the wall A during the act of elevating the grain.

Third, connecting the swinging receiving tube E with the stationary tube B, by means substantially as and for the purpose described.

Fourth, the combination of the swinging receiving tube E, screw I, and cap E', and counter-balancing weights p3, for the purpose set forth.

Fifth, the combination of a series of tubes E B and B', and a series of elevating screws I and I', the whole being combined, arranged, and operating substantially in the manner and for the purpose set forth.

No. 38,005.—EDWIN L. SIMPSON, of Monroe, Fairfield county, Conn., assignor to Himself and JARED WILSON POST, of New Haven, Conn.—*Improved Composition for Waterproofing Fabrics*.—Patent dated March 24, 1863.—The object is to produce a water-proofing composition free from sulphur. Two parts of gutta percha and three parts of camphene or naphtha are melted together; a drying oil is then prepared, by boiling a vegetable oil to the consistency of jelly; when cool, to four gallons of concentrated oil add one of cleansed benzine, three gallons of camphene or naphtha, and three gallons of the above solution of gutta percha. Color to suit, and apply to the fabric.

Claim.—First, a water-proof compound composed, in the manner described, of gutta percha and camphene, or naphtha, for the purpose and substantially as herein set forth.

Second, the compound produced by combining with the liquid gutta percha, prepared as described, benzine, camphene, and boiled vegetable oil, in the manner and for the purpose substantially as herein set forth and described.

No. 38,006.—EDWIN L. SIMPSON, of Monroe, Springfield county, Conn., assignor to Himself and JARED WILSON POST, of New Haven, Conn.—*Improvement in the Manufacture of Flocked Water-proof Fabrics*.—Patent dated March 24, 1863.—The invention consists in applying to fabrics the water-proof compound which was the subject of letters patent No. 38,005, dated March 24, 1863, and adding thereto a coating of flocks.

Claim.—The coating water-proof fabrics, in the manner herein described, with flocks, or similar material, when the said fabrics are prepared in the manner substantially as herein set forth.

No. 38,007.—J. O. TABER, of Salem, Ohio, assignor to Himself, C. R. TABER, and W. S. STETSON, of same place.—*Improvement in Track-Clearers for Harvesters*.—Patent dated March 24, 1863.—The swath-board is secured to the shoe by means of a projecting pin on each side of the former, which fits in the curved grooves of the projection in the rear of the shoe. An additional swath-bar is pivoted to the inside of the swath-board, which has a vertical adjustment by a set screw.

Claim.—First, the method of attaching the swath-board C to the shoe B of the finger-bar, as herein shown and described, to wit, by means of the pin c, secured transversely in the swath-board, and the recesses b b in the sides of the slot a of the shoe B, the pin being fitted in the recesses, and the inner end of the swath-board bearing against the inner edge of the slot.

Second, attaching the arm D to the swath-board C by means of the socket E, which is provided with a plate e, having a curved slot f in it, through which a screw g passes, the socket being attached to the swath-board by a screw d, which is at the centre of a circle of which the curved slot f forms a part, as and for the purpose herein set forth.

No. 38,008.—JOHN UNDERWOOD and FREDERICK V. BURT, of London, England, assignors to WALDO MAYNARD and CHARLES R. THAYER, of Boston, Mass.—*Improvement in Composition for Printing and Copying-Ink*.—Patent dated March 24, 1863.—Patented in England, September 19, 1856.—The object is to produce an ink which shall be transferable from the printed impression to moist paper in a letter-press, so as to copy printed blanks which have been filled up with copying-ink. The preparation is as follows: Of nut-galls, fourteen pounds; sulphate of iron, six pounds; gum senegal, twelve pounds; treacle, six

pounds; soap, three pounds; lampblack, six pounds; Prussian blue, three pounds; and filtered rain-water, fifteen imperial gallons, properly compounded. Other formulas are given.

Claim.—Our new manufacture of printing and copying ink, as made of soap and other materials, and in manner substantially as herein before described.

No. 38,009.—EDWARD S. WINCHESTER, of Boston, Mass., assignor to Himself and JOSEPH GARDNER, jr., of same place.—*Improved Clasp for Shoes, Belts, &c.*—Patent dated March 24, 1863.—One end of the strap has a short plate with a stud, which is inserted into a hole in the double plate and passed along in a slot, being retained at the desired point by a ratch, whose teeth engage with the shank of the stud. The ratch is closed against the stud by a spring, and withdrawn by a thumb-piece sufficiently to admit the passage of the stud.

Claim.—The clasp constructed substantially as above described.

No. 38,010.—Mrs. HENRIETTA H. ADAMS, of New York, N. Y.—*Improvement in Hair Crimpers.*—Patent dated March 24, 1863.—This invention consists of two blocks hinged together, and each formed on its respective faces with grooves of different widths, so that, by turning the apparatus in either position, crimps of any desired size may be provided.

Claim.—First, a double hair-crimper adapted for use in reversed positions, substantially as herein described.

Second, in combination therewith a hinge or hinges applied substantially as set forth, to adapt the machine for use in either position.

Third, the hook D, or other suitable catch or fastening, in the described combination with the double hair-crimper.

No. 38,011.—J. HERRINGTON HENDEE, of Blackman, Jackson county, Michigan.—*Improvement in Stump Extractors.*—Patent dated March 24, 1863.—This machine is supported upon a sled. The lever vibrates upon the forward bench, and a chain having been attached by a hook to a prominent root, is fastened to the shorter end of the lever. The longer end is depressed by a rope passing over a system of pulleys in the draught-beam and the end of the lever, the former being attached by a staple to the round at the nose of the sled, and its heel end set into the forward bench.

Claim.—First, making the horizontal beam E serve the double purpose of a draught-beam for the sled and a purchase for the lever G, as herein described.

Second, the auxiliary beam H, arranged as described, in combination with the sled runners A A and lever G, as herein described.

Third, the fulcrum plates *h h'* and lips *i i*, or their equivalents, in combination with the lever G, and transverse bridge-tree C, substantially as described.

Fourth, combining with sled runners A A, spread out at their rear ends, the standards A A, bridge-tree C, lever G, draught-beam E, pulleys *g g'*, *s s'*, and rope *k*, substantially as described.

No. 38,012.—S. MCCLANATHAN, of Warren, Ill.—*Improvement in Beehives.*—Patent dated March 24, 1863.—The case is divided off into compartments, occupied by interchangeable boxes, or drawers, which are provided with a projecting entrance, or tube. Each drawer has a tray beneath it, which may be withdrawn to remove the refuse of the box, the latter having holes for communication, and dividing slides to partition off the family as may be desired.

Claim.—The combination and arrangement of the hive sections and interchangeable boxes, or drawers, substantially as and for the purposes herein specified.

Also, the projecting funnel-shaped entrance tubes, with their ventilating caps, substantially as specified.

No. 38,013.—ORAN W. SEELEY, of Syracuse, N. Y.—*Improvement in Device for Operating Churns.*—Patent dated March 24, 1863.—The churn is operated by a crank on the fly-wheel shaft, which, by pitman-balance, lever, and connecting rod working in a guide, gives a vertical reciprocating motion to the dasher and shaft.

Claim.—The employment of the vertical reciprocating connecting rod *a*, working in guide D', in combination with the dash churn and the balanced lever, arranged and operating in the manner and for the purposes substantially as described.

No. 38,014.—OTIS TUFTS, of Boston, Mass.—*Improved Construction and Defence of War Vessels.*—Patent dated March 24, 1863.—This invention consists of side-armor and backing secured to the hull. One feature of this improvement is in making the form of the armor to conform to the true lines of the vessel, and securing her symmetry as if no armor were incorporated in her structure. This is accomplished by making a recess in the hull and bending the plates inwards from the required distance below the water-line to the offset of the oblique roof. The defensive armor is composed of alternate layers of iron plates and timbers, with wrought-iron screw bolts passing vertically through them and securing them to the shelf of the recess; it is also secured by horizontal bolts, which pass from vertical straps to fixtures in the hull; said fixtures consisting of eyes with flanges, and countersunk riveted projections passing through the plates of the hull.

Claim.—In the construction of iron war ships, the recess in the sides substantially as and for the purpose described, such recesses being formed by bending inwards the frames and the plating thereon.

Also, forming the fixture *m*, which is secured to the hull, substantially as and for the purpose set forth.

Also, compressing an armor compounded of iron and of wood, or rather equivalent therefor, by means of screw bolts attached to the fixture *m*, substantially as shown.

Also, securing defensive armor to a hull by means of bolts jointed to fixture *m*, substantially as and for the purposes specified.

Also, the employment of the straps *g*, in connexion with the screw bolts *f* and the fixture *m*, for the purpose of securing the compound armor to the hull.

No. 38,015.—CHARLES N. TYLER, of Buffalo, N. Y.—*Improved Composition for Burning Fluid.*—Patent dated March 24, 1863.—The invention consists in the combination of fusil oil with the mineral and earthy oils, with naphtha and with alcohol, and in treating the combination of petroleum or kerosene and fusil oil with alcohol.

Claim.—First, the compound produced by the combination of the mineral or earthy oils with fusil oil, in the manner and for the purpose substantially as herein set forth, said compound constituting a new manufacture.

Second, the compound produced by the combination of naphtha with alcohol and fusil oil.

Third, the heavy liquid obtained by treating the combination of petroleum or kerosene and fusil oil with alcohol.

No. 38,016.—THOMAS WISE, of Boston, Mass.—*Ore Washer.*—Patent dated March 24, 1863.—This machine consists of a series of two or more tight boxes, arranged one above another with suitable pipes for the introduction of air under pressure, whereby the solution which is received direct from the stamp mill is so acted upon as to separate the earthy matter from the mineral and deposit it in layers according to its comparative gravity.

Claim.—Taking the combined ore and water direct from the stamp heads, and separating the metal in various grades by means of forced currents of air injected beneath the water, within a series of tight boxes set upon pivots one above another, all as shown and explained.

No. 38,017.—WARREN A. SIMONDS and SETH WARNER, of Boston, Mass., assignors to SETH WARNER and OLIVER WARNER, of North Hampton, Mass., and ALBERT L. FERNALD, of Boston, Mass.—*Improvement in Treating Gas for Illumination.*—Patent dated March 24, 1863.—The gas obtained by passing air through a hydro-carbon liquid is treated with a mixture of alcohol and chloride of lime to purify it.

Claim.—We do not claim the manufacture of illuminating gas by forcing air over benzole, naphtha, or other liquids simply, as that is already known—but we claim, forcing the gas thus made through a mixture of alcohol and chloride of lime, thereby effecting such a change in said gas that it is not liable to refrigeration or condensation; and also so decarbonizing said gas as to prevent smoke while burning, and prepare it for any kind of burner.

No. 38,018.—JAMES M. DICK, of Buffalo, N. Y.—*Improvement in Broilers.*—Patent dated March 24, 1863.—The meat is placed upon a flexible apron or jointed gridiron so as to be wrapped around a skeleton reel and placed on bearings in a box over the fire, where it is rotated by a crank.

Claim.—First, the flexible apron *B*, when constructed and operating as and for the purposes described.

Second, the reel *A*, flexible apron *B*, and box *O*, when used in combination for the purposes as described.

No. 38,019.—STEPHEN M. ALLEN, of Woburn, Middlesex county, Mass.—*Improvement in the Manufacture of Paper for Collars.*—Patent dated March 31, 1863.—After separating the fibre of straw, the filaments thus obtained are steeped in water successively from lukewarm to boiling, when an alkaline solution may be added until the albumen nearest to the surface can be rinsed away. After each warm water bath the filaments are rinsed in warm or cold water. They are then allowed to dry, when the fabric is quite free from albumen and in proper condition to be resolved into its natural elements by mechanical means, whereby the fibre is drawn down longitudinally, dividing it into short filaments whose ends are stranded. The fibres so reduced are then put into the pulp, giving a greater strength to paper used for the manufacture of collars and other purposes.

Claim.—The production of paper adapted to the manufacture of collars, wristbands, and other similar articles of wear from flax, hemp, jute, or other long-stapled fibrous substance, by treating the said fibre in warm water at successively increased temperature, as described, in combination with the reduction thereof by mechanical means substantially as herein set forth.

No. 38,020.—STEPHEN M. ALLEN, of Woburn, Mass.—*Improvement in the Manufacture of Paper from Wood.*—Patent dated March 31, 1863.—Wood, cut and sawed into suitable length, is crushed longitudinally to preserve the fibres and steeped and washed alternately in

warm water of different temperatures. The mass is then boiled, bleached, and ground and is then ready to be manufactured into paper.

Claim.—The manufacture of paper pulp or paper from wood by performing the operations of cutting the wood in suitable lengths, crushing it in such a manner as to preserve the integrity of the fibre in its longitudinal direction, alternating, steeping, and washing the same at increased temperatures, and finally boiling, grinding, and bleaching the same; the whole in succession substantially as herein described.

No. 38,021.—BENJAMIN T. BABBITT, of New York, N. Y.—*Improved Method of Using Exhaust Steam for Heating Purposes.*—Patent dated March 31, 1863.—The invention consists in leading the exhaust pipe through the chimney or flue and thence to the apparatus to be heated.

Claim.—Conducting the exhaust pipe D into and for a certain distance through the chimney C, or other flue, and thence out to the vessel or apparatus to be heated, substantially as herein described.

No. 38,022.—YOUSOUFF BEY, of New York, N. Y.—*Improved Composition for Covering and Protecting Iron.*—Patent dated March 31, 1863.—The composition consists of rosin or rosin and copal, forty to seventy pounds; tallow, twenty to fifty pounds; beeswax, five pounds; oxide of iron, five pounds. Melt the rosin, then add the tallow in which the oxide of iron has been previously mixed, then add the beeswax, keep it below boiling heat; stir well.

Claim.—A compound for protecting iron from corrosion, composed of the ingredients above named, and in the proportions substantially as above described.

No. 38,023.—LORENZO BOMMER, of New York, N. Y.—*Improved Door and Shutter Spring.*—Patent dated March 31, 1863.—To the door post or window frame is attached a pintle with a transverse pin and a spring, and attached to the door is a plate, whose flange sets over the pintle so that in opening the door the stud on the flange presses against the spiral spring which shuts it when the pressure against the door is removed.

Claim.—The plate H with the projection *g* and plate I, in combination with the pintle E and pin F, constructed and applied substantially as and for the purpose specified.

No. 38,024.—JOSHUA W. BRADWAY, of Akron, Fulton county, Ind.—*Improvement in Animal Trap.*—Patent dated March 31, 1863.—This trap is so constructed that an animal pulling upon the bait releases the trigger, and the sectional floor is caused to rotate by the influence of the weight on the drum attached to the axis of rotation of each section, thus dropping the animal into the chamber of the trap, and the board continuing its rotation, is arrested by the spring which had returned to its original position, and the trap is ready for another victim.

Claim.—The arrangement of the box A, hinged bottom *a*, revolving sections of the top *g g*, flanged drums *i i*, T-shaped support B, pulleys *i j*, weighted cords *k k*, combined hook and trigger *n o*, support *m* and spring D, all in the manner and for the purposes herein described.

No. 38,025.—JACOB BRINKERHOFF, of Auburn, Cayuga county, N. Y.—*Improved Mode of Hanging Balance Wheels, &c.*—Patent dated March 31, 1863.—The object of this improvement is to hang a wheel in such a manner that it has no lateral strain or tendency to rock; and this is accomplished by attaching the wheel firmly to a central shaft which is made to run inside the true axle as in a sleeve, the latter not passing through the hub of the wheel, of course, but leaving sufficient space for the firm attachment of the wheel and central shaft.

Claim.—The manner herein described of hanging fly or balance wheels, gear-wheels and pulleys, so as to relieve the shaft to which they are attached from lateral strain, as and for the purpose specified.

No. 38,026.—JOHN BROOKS and JOS. H. SANFORD, of North Bridgewater, Mass.—*Improved Edge Plane for Trimming Soles of Boots, &c.*—Patent dated March 31, 1863.—This consists of a circular plane set to a convenient handle; the plate has an annular recess in one face for the reception of steel cutters, which are laid to each other in such a way that one forms a cutter and the other the throat, and are retained in position by a screw and plate, which laps their inner edges, and when down these pieces are interchangeable with each other.

Claim.—The combination of the knife and guard, so constructed and arranged, as set forth, that they may be reversed and transposed as described.

No. 38,027.—W. F. BROOKS, of New York, N. Y.—*Improved Method of Affixing Tubes in Steam Condensers.*—Patent dated March 31, 1863.—Between the tube sheet and an additional sheet is a perforated sheet of India-rubber, which being clamped tightly upon the elastic material makes a steam-tight joint. At one end this joint is formed in a ferrule, the elastic material fitting in a groove in its periphery, the said ferrule being, for a part of its length, of a conical shape, so as to admit of its being easily withdrawn after it is once started.

Claim.—The employment of a perforated sheet or sheets of rubber in combination with the tube sheets and ends of the tubes for securing said tubes in place and maintaining a tight

joint while allowing for the varying length of tubes due to expansion and contraction as described.

Also, the ferrule and groove thereon for the purpose described herein.

No. 38,028.—J. S. BROWN, of New York, N. Y.—*Infants' Exercising Machine*.—Patent dated March 31, 1863.—To a suitable base a pedestal is attached, and upon this is a vibrating lever pivoted thereto. To one end of this lever is a cord attached to a treadle on the floor, and near this is a spring connecting the lever and base, and adjustable nearer or further from the point of vibration, to increase or diminish its tension. At the other end of the lever is the cot or chair for the infant, and the machine being set in motion the action on the treadle forms the motive power; the spring and the weight of the cot nearly balancing each other, keep up a constant vibrating motion.

Claim.—First, the employment of a competent frame, consisting of the platform and pedestal, or their equivalent, sustaining a vibrating lever, as set forth, to one end of which lever is attached the chair or couch, and the other end of which is connected with a spring also attached to the aforesaid frame, the combination being substantially as described.

Second, in the above apparatus, the notches in the lever by which the active power or elasticity of the spring is varied at will, as and for the purpose specified, and the perforated strap N and pin 12, or their equivalent, to vary the height of the chair from the platform for the purpose set forth.

Third, the loop 2, bar 4, spindle 5, and bail or bow E, arranged and connected with the lever and with the chair or couch as and for the several purposes specified.

Fourth, the specific method of arranging the pedal with respect to, and of combining the same with, the lever and the spring so as to operate in connexion therewith for the purpose, in the manner and with the results specified.

No. 38,029.—OLIVER M. BROWN, of Toledo, Ohio.—*Improvement in Furnaces for Heating Tires*.—Patent dated March 31, 1863.—This invention consists of an annular furnace provided with a number of draught holes and a chimney; in this furnace the kindling is laid, and upon it the tire, then the wood is piled on and the cover closed; fire is then applied at the different blast-holes to make an even heat.

Claim.—The above-described furnace as a new article of manufacture, the same being provided with a peculiar arrangement of flues with doors, in the manner and for the purposes set forth.

No. 38,030.—ROBERT BRYSON, of Schenectady, N. Y.—*Improvement in Harvesters*.—Patent dated March 31, 1863.—The invention consists in an apparatus for throwing the sickle in and out of gear by protruding or withdrawing slides which work in a fast hub on the secondary shaft and engage with an otherwise loose pinion which meshes into the larger wheel on the driving shaft; a weighted lever or counter-balance for the cutter bar; a friction roller in the stirrup bearing upon the head of the bracket to which the cutter bar is attached, and a method of raising the cutter by the intervention of a segment and a secondary lever as represented.

Claim.—First, the combination in a harvester of the driving wheels, large spur wheels C C, driving shaft, double bevelled or angular spring latches *g g*, hold-back pins *d d*, slots *e e*, hubs H H, depressions *h h*, and pinions *a a*, for the purpose of throwing into and out of action the sickle of the harvester, as herein described.

Second, the combination of spring latch boxes H H, constructed as herein described, fixed to a rotating shaft D, with loose spur wheels *a a*, driving spurs C C, bevelled spur E, its pinion *b*, longitudinal shaft F, crank wheel F', and connecting rod G, when the same are arranged in connexion with a harvester, and operate substantially as herein described.

Third, the employment of the loaded lever L, attached to the sliding stirrup I, and connected to the cutting apparatus, so as to enable me to nicely balance, and at the same time to allow of the vertical adjustments of the cutting apparatus, substantially as herein set forth.

Fourth, the friction roller *k*, in the stirrup I I, when placed in such a relation to the rounded head of the pivoted bracket J, as to serve as an anti-friction bearing for said bracket, essentially as herein set forth.

Fifth, attaching the short arm of the lifting lever M to the balancing lever L at a point which is between the extreme end of the short arm of this lever and its fulcrum, substantially as herein set forth.

No. 38,031.—MILLS L. CALLENDER, of New York, N. Y.—*Improvement in Hydro-carbon Burners*.—Patent dated March 31, 1863.—The object of this invention is to prevent the heat of the burner passing to the wick tube and oil receptacle, and to enable the hydro-carbon to be burnt clearly without the aid of a chimney. The deflector is formed with a base of metal and a cylinder of mica, surmounted by a dome of metal, with a flame slit in it. The mica and metal are attached by placing it outside of the base and dome, and then putting on rings which clamp it there; projectors are then punched through the rings into contact with the metal of the base and dome, and the mica is secure; the adjustable flame cone is constructed similarly.

Claim.—First, the improved lamp deflector, composed of a combination of mica and metal, consisting of a metallic base ring or flange *f*, the mica or similar non-conducting cylinder *d*, and insulated dome *b*, constructed as above set forth.

Second, the use of a mica, glass, or similar non-conducting cylinder when applied to a lamp top for the purposes above specified.

Third, the method of securing the mica to the metal as above specified.

Fourth, constructing the interior adjustable cone *m*, of a combination of mica and metal as above set forth.

No. 38,032.—JACOB O. CLUTE and PHILIP KIMMEY, of Albany, N. Y.—*Improvement in Fastening Covers to Axle Boxes.*—Patent dated March 31, 1863.—The object is to fasten down a flat lid, by a bolt passed through two lugs, without the liability of jarring out. This is effected by a flat-sided bolt, which being passed into its place is rotated until the ends of a spring leaf impinge upon its flatness and secure it from longitudinal or lateral motion; when forcibly rotated to bring its round side to the spring, it is in a condition to be withdrawn.

Claim.—The combination of a flat-sided bolt *C*, or its equivalent, with a spring *B* for fastening the covers or caps of car axle boxes, substantially as herein specified.

No. 38,033.—C. COLGATE, of Lancaster, Ohio.—*Improvement in the Manufacture of Flour.*—Patent dated March 31, 1863.—The improvement consists in the addition of kiln-dried starch to the wheat before grinding, by which means it is thoroughly incorporated with the flour.

Claim.—The admixture of kiln-dried starch with wheat, to be ground therewith in the manufacture of flour, substantially as and for the purposes herein specified.

No. 38,034.—THOMAS H. CURRIE, of Webster, Merrimack county, N. H.—*Improvement in Surgical Splints.*—Patent dated March 31, 1863.—The splint consists of a trough of suitable material made in two pieces, and extensible longitudinally with a screw and swivel nut to prolong it as necessary, and having a foot-piece, which, by means of a screw and angle iron, may be set at any required angle with the line of the direction of the leg, so as to vary its position for relief or according to the exigencies of the fracture, &c.

Claim.—First, the combination of the sides *A B* and *A' B'*, each composed of two pieces, the sacking *C*, the screw *E*, and the swivel nut *F*, the whole to operate substantially as herein specified.

Second, combining the foot-piece *D* with the outer side of the splint by means of the slotted angle iron *F*, the screw *n*, pin *j*, and screw *k*, the whole applied substantially as and for the purposes herein set forth.

No. 38,035.—LOUIS DEROME, of San Francisco, Cal.—*Improved Bureau and Bedstead.*—Patent dated March 31, 1863.—The front of the bureau pulls out to form the foot-board of the bed, and the hinged mattress, which had been folded, is brought to a horizontal position. The hinges, by which the side rails of the mattress are fastened to the foot-board, have projections which slide in vertical grooves and allow the casters to reach and run upon the floor.

Claim.—First, the application to bureau bedsteads of a hinge *D*, with its arms or branches terminating in flanges *e e*, sliding up and down the guide plates *h h*, for the purpose of allowing the casters *u u* to traverse upon the floor in closing the bedstead substantially in the manner herein described.

Second, the combination of the hinged mattress with a bureau having a movable front when said front is attached to the mattress by means of the hinges *D*, substantially in the manner and for the purposes herein described.

No. 38,036.—PARKER DEXTER, of Clinton, Clinton county, Iowa.—*Improved Machine for Bunching and Pressing Shingles.*—Patent dated March 31, 1863.—The machine consists of a bed-piece and a pair of folding end boards which are raised for the butts of the shingles to be set against in bunching, and folded down for the removal of the bunch.

The motion of the boards is given by a lever and racks operating through toggles, and the clamping arrangement consists of a bent bar on each side, which is depressed by the downward retraction of the yoke to which it is attached, by the rotation of an eccentric on the lever shaft.

Claim.—The movable or adjustable end boards *J J*, in combination with the bars or yokes *G G*, bars *H H*, and eccentrics *C C D D*, on shaft *B*, all arranged and applied to the frame *A*, to operate substantially as and for the purposes herein set forth.

No. 38,037.—WILLIAM O. DREW, of Georgetown, D. C.—*Improved Machine for Making Bread.*—Patent dated March 31, 1863.—The invention consists of a fluted roller and convex plate, between which the dough, previously reduced to a thickness by a rolling pin, is rolled back and forth to knead it.

Claim.—The fluted roller *A*, the convex *C*, and the adjustable plates *D*, the whole arranged and combined substantially as set forth and described.

No. 38,038.—JAMES B. EADS, of St. Louis, Mo.—*Improvement in Operating Guns and Gun Towers*.—Patent dated March 31, 1863.—The improvements consist in making the gun tower in sections, the upper one sliding down telescopically within the lower, and in the method of levelling the gun in the tower in the act of raising it by the tripping-pin near the muzzle and the guide on the tower, so as to bring the gun in range with the porthole.

Claim.—First, making the gun-tower in sections so that the top section may be lowered into the hold of the vessel, for the purpose and in the manner substantially as described.

Second, levelling the gun in the tower, in the act of raising it, by means of the tripping pin near its point or muzzle, and the guide on the tower, so that a very small port may be used, as the gun must enter it fairly, without striking the sides of the port, substantially as described.

No. 38,039.—E. C. FROST, of Highland Nurseries, Schuyler county, N. Y.—*Improved Cooked Vegetable Food*.—Patent dated March 31, 1863.—The invention consists in the preparation of potatoes, by which the nutritive portion may be extracted, and decay prevented, by cooking, drying in thin sheets, and pulverizing.

Claim.—A new article of manufacture and commerce, the condensed product of the *Solanum tuberosum* in a cooked state for food; prepared substantially in the manner and for the purpose herein set forth.

No. 38,040.—L. D. GALE, of Washington, D. C.—*Improvement in Treating Phosphatic Guanos*.—Patent dated March 31, 1863.—The invention consists in mixing animal matter, previously treated with acid, with the guano; in the use of sulphate of lime in this connexion, and the use of the acids, for separating the nitrogenous material from the oily in the preparation of the animal matter.

Claim.—Making a concentrated manure by mixing animal matter, previously treated with acid or its equivalent with the guano, substantially in the manner and for the purpose set forth.

Also, the use of sulphate of lime, in combination with the animal matter treated previously, substantially in the manner and for the purpose set forth.

Also, the use of the acids, substantially as set forth, for separating the nitrogenous material from the oil, whereby both products are "rendered" quicker and in a purer state than when so separated by boiling or steaming with water only.

No. 38,041.—D. W. GOULD, of Independence, Buchanan county, Iowa.—*Brick Machine*.—Patent dated March 31, 1863.—The improvements are in an inclined plate, which rotates with the central shaft near the bottom of the cylinder, to press the clay through an opening into the moulds; a sliding plate, worked by a cam, which opens and closes the said opening at the appropriate times, and an arrangement of the moulds by which the soft brick are discharged by the movable bottoms, acting as pistons in the moulds, and operating simultaneously to discharge all the bricks at once by the movement of the lever.

Claim.—First, the pressure plate G, operating as and for the purpose specified.

Second, the sliding plate M and cam N, in combination with the openings O and P, for the purposes set forth.

Third, the moulds, (figures 4 and 5,) when constructed substantially as herein described, and operating as specified.

No. 38,042.—ISAAC HARTSHORN, of Providence, R. I.—*Improvement in Breech-loading Fire-arms*.—Patent dated March 31, 1863.—These improvements are designed to assist in the retraction of the cartridge, and consist in pivoting the cartridge block upon an arm, which itself is pivoted to the stock so as to give the block a double movement, one away from the barrel, and the other to elevate it so as to expose the orifice of the cartridge chamber upwards; a further appliance, by which the conical cartridge case is loosened so as to be readily withdrawn, consists of a sliding breech-pin, which, as the cartridge block is withdrawn, is forced into the rear of the cartridge chamber and starts the capsule of the exploded cartridge.

Claim.—The link C and joints *a* and *b*, whereby the cartridge block is first withdrawn from the barrel, and the mouth of the cartridge chamber is then elevated as described.

Also, the bolt *r*, arranged and operating as described for the purpose set forth.

No. 38,043.—SAMUEL J. HOGGSON, of New Haven, Conn.—*Self-inking Hand-stamp*.—Patent dated March 31, 1863.—The inking roller is caused to pass across the face of the stamp by a horizontally sliding rod attached to the tail end of the vibrating lever, which, at its upper end, forms the hammer shaft.

Claim.—The horizontal motion imparted to the inking-roll by the use of a lever, springs and pressure, operating substantially as and for the purpose herein set forth.

No. 38,044.—ELBRIDGE G. HOWE, of Millbury, Worcester county, Mass.—*Improvement in Plastering Trowels*.—Patent dated March 31, 1863.—The blade and shank of the trowel are formed in one piece.

Claim.—As a new and improved article of manufacture, a plastering trowel having its blade and shank formed in one piece, as herein shown and described.

No. 38,045.—FRANCIS M. HUBBARD, of Protection, Erie county, N. Y.—*Improvement in Dampers*.—Patent dated March 31, 1863.—This invention is intended to radiate back the heat which is passing up the pipe by presenting a polished convex surface in the line of its passage, while the smoke is allowed to follow the tortuous track to its final exit.

Claim.—The tube C, the convexo-concaves *a a*, the rim B, when combined with the pipe A, the whole constructed and operating in the manner and for the purpose substantially as herein set forth.

No. 38,046.—JAMES KENNELLY, of Hartford, Conn.—*Improved Metal for Horseshoes, &c.*—Patent dated March 31, 1863.

American charcoal iron.....	30 pounds.
Bone dust.....	4 ounces.
Manganese.....	2 “
Ferrid cyanide.....	1 “
Hematite.....	6 “
Wolfram.....	7 “

melted together, and run into moulds of the required shape.

Claim.—The within-described composition, made of the ingredients herein specified, and mixed together about in the proportion and in the manner substantially as set forth.

No. 38,047.—JAMES KENNELLY, of Hartford, Conn.—*Improvement in Mould for Casting Horseshoes*.—Patent dated March 31, 1863.—The mould is provided with a plate having pins which carry cones to make the nail holes. By the motion of the lever these pins are simultaneously projected into the mould or withdrawn.

Claim.—As a new and improved article of manufacture, a mould for casting horseshoes, provided with a plate C, carrying the cores *e* for the nail holes, and adjustable by cams D D', as and for the purpose shown and described.

No. 38,048.—C. W. THEODORE KRAUSCH, of Chicago, Ill.—*Improvement in Grain Drying Apparatus*.—Patent dated March 31, 1863.—A plate heated to redness is placed above the flame of a furnace, and air from a blast-fan is blown upon it from a pipe with a flaring funnel-shaped opening. This air is conducted away around the edges of and through holes in the funnel, and by the same fan is driven to the drying chamber.

Claim.—First, facilitating the heating of air for drying purposes on the surface of a red-hot plate, through the agency of a fan and a pipe with a flaring discharge, or by the equivalents thereof, substantially as described.

Second, the combination of means, substantially as herein described, for facilitating the heating of air, for drying purposes, on the surface of a red-hot plate, and discharging and distributing it into a drying chamber, as set forth.

No. 38,049.—SAMUEL MACFERRAN, of Philadelphia, Pa.—*Improvement in Mode of securing Iron Railings to their Posts*—Patent dated March 31, 1863.—A thread is cut upon each end of the panel rod, and a nut with a flange attached is screwed on to them; these are then dropped into openings on the lugs attached to the posts.

Claim.—The combined pin and nut, constructed, arranged and operating substantially in the manner and for the purposes set forth.

No. 38,050.—ROBERT LANGWORTHY, of Brooklyn, N. Y.—*Improvement in Hernial Trusses*—Patent dated March 31, 1863.—The pan which is pivoted upon the end of the main spring has an upward oblique pressure given to it by an additional spring which acts upon the rear prolongation of the plate to which it is attached.

Claim.—The arrangement of the two springs A C, and pad B, as set forth, so as to give the pad upward and oblique pressure, in the manner and for the purposes set forth.

No. 38,051.—JAMES LOUGHRIDGE, of Pittsburg, Pa.—*Improved Whitewash Brush*.—Patent dated March 31, 1863.—This consists of a sheet-metal frame of a truncated wedge-shape and braced by thin strips of the same material to prevent the springing or opening of the frame, and also dividing it into compartments into which the bristles are inserted with their points downward from the upper and wider part of the frame. The handle of the brush is made of sockets of different presentations cast in one piece.

Claim.—The use, in the manufacture of brushes, of a prismoidal wedge-shaped frame made of thin sheet metal, and divided into compartments by partitions or traces for the purpose of securing the bristles in a compact body, substantially as described.

Also, in combination therewith, the use of a socket for the handle of brushes consisting of two or more short cylinders cast in one piece, substantially as described.

No. 38,052.—EDWARD J. MALLETT, of New York, N. Y.—*Improvement in Putting up Smoking Tobacco*.—Patent dated March 31, 1863.—The invention consists in putting up a charge of tobacco in a capsule to fit a pipe, the said charge being perforated for draught and for its ignition from the centre.

Claim.—A tobacco cartridge consisting of a charge of tobacco of proper quantity for a pipe, put up in a paper capsule and perforated centrally, either entirely or partly through, substantially as herein specified.

No. 38,053.—JOHN P. MANNY, of Rockford, Ill.—*Improvement in Harvester.*—Patent dated March 31, 1863.—The wheel is constructed with a plate or flange running around the rim of the wheel on the side next the gearing, and the main gear wheel is placed within this projecting flange on the driving wheel in order to prevent dirt being carried up by the rim and dropped upon the gearing.

Claim.—The combination of the rim or tread and a plate or a series of arms, arranged in, or nearly in, a plane passing through the centre of said rim, with a flange connecting the two, and flush with the edge of the rim next the gearing, when constructed substantially as described, and for the purpose set forth.

No. 38,054.—JOHN P. MANNY, of Rockford, Ill.—*Improvement in Harvesters.*—Patent dated March 31, 1863.—The bevel wheel is mounted upon the frame, and its projecting hub with the pinion engages with the teeth in the inside of the rim wheel, which is bolted to the driving wheel.

Claim.—Mounting the bevel wheel and spur pinion upon a projecting bearing so that the bevel wheel shall be between the gear frame and driving wheel, but outside of the plane of the latter, as set forth, in combination with the crank shaft having its bearing upon the gear frame, substantially as described.

No. 38,055.—RUFUS NUTTING, of Randolph, Orange county, Vt.—*Improvement in Vegetable Cutters.*—Patent dated March 31, 1863.—In the frame of this machine, and forming one side of the hopper, is a rotary cone having cutters affixed to it and holes through which the pieces of cut root may pass; the greater part being discharged through the notches in the hopper bottom against which the cone rotates. A slat cylinder above is used to remove dirt, &c., from the roots previous to grinding.

Claim.—First, the conical-shaped hollow cylinder in combination with the semi-conical-shaped knives or cutters and elliptical or egg-shaped holes, constructed substantially as and for the purposes herein set forth.

Second, the cylinder C, or its equivalent, for removing from vegetables, before cutting, the dirt and gravel which otherwise would dull the cutters and injure the teeth, stomach and intestines of animals, in combination with the conical cylinder I, or other device, for cutting vegetables, substantially as set forth.

No. 38,056.—ISRAEL MOSHER and WALDEN EDDY, of Mosherville and Union Village, Saratoga and Washington counties, N. Y.—*Improvement in Shovel Ploughs.*—Patent dated March 31, 1863.—Behind and beneath the shovel plough standard, with its sole resting upon the ground, is a triangular frame for regulating the depth of the furrow. On the edges of the wings of the shovel are curved extension pieces to distribute the earth evenly. The sole of the shoe or lower side is dovetailed into the latter so as to be readily withdrawn and replaced.

Claim.—The combination of the right-angle triangle *d*, or its equivalent, with the beam standard *a'*, having thereto attached the mould-board *b b*, substantially as herein described and set forth.

Also, the curved extension pieces *i i*, in combination with the wings of the mould-board *b b*, substantially as and for the purposes herein described and set forth.

Also, the employment and combination of the shoe *e* with the right-angle triangle *d*, substantially as and for the purposes herein described and set forth.

No. 38,057.—EZRA MILLER, of Janesville, Rock county, Wis.—*Improvement in Car Coupling.*—Patent dated March 31, 1863.—The device consists of two horizontal coupling hooks, having double bevelled ends and vertical sides, one being arranged on the end of each car to interlock with one on any other car on contact under the influence of the springs which impinge upon the back of each of the hooked coupling bars. There is a spring gate which yields and allows the bar to couple, and then forms an abutment or stop to prevent the casual displacement of the hooks. The rear end of the coupling rods is recessed to admit of the insertion of a spring to moderate the force of concussion.

Claim.—First, the combination of the double bevelled coupling hooks, the stirrups E E, and the springs N N, all constructed and arranged so as to operate in the manner and for the purposes described.

Second, the spring gate F, constructed, arranged, and operating substantially as and for the purposes described.

Third, the combination of the laterally located spring gates F F, with wings *f f'*, stop pin *h*, and coupling hooks C C', substantially as and for the purposes described.

Fourth, the double bevelled hooks C C', disconnected from any coupling or bumper box, constructed, arranged, and operating in the manner described.

Fifth, the combination of the hooks C C', vertical spring gates F F, the draw chain *i j*, and windlass rods *i' i'*, substantially as described.

Sixth, forming in the rear ends of the coupling hooks a longitudinal slot D, adapted to receive a spring or its equivalent, and to allow of the pivoting of the hooks at their rear ends, substantially as and for the purposes herein described.

Seventh, the combination of the pivoted, slotted, shanked coupling hooks with the forward support E, and spring gates F F, arranged substantially as herein described.

No. 38,058.—HENRY PEASE, of Brockport, Monroe county, N. Y.—*Improvement in Rotary Pumps*.—Patent dated March 31, 1863.—The improvements consist in a washer for preserving the valve stem from wear, in the method of packing the central shaft, the bearing on which the driving pulley is centred, and the clutch box for putting it in or out of gear on the shaft, and the water chamber which is designed to keep a pressure of water upon the points for the purpose of excluding air.

Claim.—First, the sleeve *s*, in combination with the piston stem *e*, substantially as described, for the purpose set forth.

Second, the adjustable stuffing-box B, with the perforated waste chamber *n*, substantially as and for the purpose set forth.

Third, the combination of the bearing arm 2, pulley F, and clutch couplings 25 and 6, substantially as and for the purpose set forth.

Fourth, the combination of the support *a*, water chamber 17, stuffing nut *b*, and waste chamber *n*, substantially as and for the purpose set forth.

No. 38,059.—HENRY PEMBERTON, of East Tarentum, Alleghany county, Pa.—*Improvement in the Manufacture of Paper from Sorghum*.—Patent issued March 31, 1863.—Antedated October 1, 1862.—The crushed stalks are washed to remove the saccharine and soluble matter, and then boiled in a solution of caustic alkali to extract the silica, oily and coloring matter, and to open the fibre, and are again washed. They are next steeped in acidulated liquor, washed, and steeped in a solution of chloride of lime, washed, acidulated, and again washed. These operations reduce the stalks to a homogeneous white pulp to be worked up by the usual mechanical means.

Claim.—The manufacture of pulp from the stalks of the sorgo sucre or Chinese sugar barre, as a substitute for linen and cotton rags in the manufacture of white or the better qualities of paper, in the manner substantially as hereinbefore described.

No. 38,060.—WALTER S. PHELPS, of Detroit, Mich.—*Improvement in Turning Cross Heads, Wrists, or Pins, &c.*—Patent dated March 31, 1863.—This invention consists of a geared rotating ring having a cutter attached to it, used in connexion with an adjustable bed-plate.

Claim.—First, the ring D, provided with a cutter L arranged as shown, or in an equivalent way, to be operated or fed automatically by the rotation of the ring, for the purpose herein set forth.

Second, providing the ring D with teeth on its periphery, and fitting the same within a proper bearing formed by a stationary projection B and a cap C, substantially as shown, for the purpose of operating or rotating the ring directly from the driving shaft F, as herein set forth.

Third, the inclined plate S, in combination with the plate A and screws Q T, for the purpose of adjusting the work concentrically within the ring D, or in a proper relative position with the cutter L, as herein described.

Fourth, the nut or cutter stock H, in combination with the screw I, tappet wheel K, adjustable slides N N', provided with the pins *d d'* and the catch or pin *h*, or its equivalent, for the purpose of feeding the cutter L to its work, as set forth.

No. 38,061.—WM. R. RICHARDSON, of San Francisco, Cal.—*Improved Washing Machine*.—Patent dated March 31, 1863.—Revolving in bearings in the sides of a suds box is a fluted cylinder having above it a concave segment of rollers between which and the cylinder the clothes are passed. On the central cylinder shaft is an eccentric which gives a reciprocating motion to a plunger, which sliding in guides presses the clothes between the follower and a stationary board at the end of the tub.

Claim.—The combination of the eccentric die E, with the cylinder B, the plunger F, sliding in guides J, and revolving in opening G, and the roller frame D, all arranged substantially as and for the purpose set forth.

No. 38,062.—GEO. RIESECK, of Pittsburg, Pa.—*Improvement in Slide Valves of Steam Engines*.—Patent dated March 31, 1863.—The invention consists in arranging the slide and bonnet and a flexible diaphragm so that the valve and bonnet can expand and contract, the steam pressing upon both sides of the valve to diminish its friction, leaving a sufficient preponderance above to maintain it to its seat, and on the contact surface of the bonnet to keep its joints steam-tight.

Claim.—Constructing and arranging the valve A, bonnet B, and diaphragm E, substantially as herein described and for the purpose set forth.

No. 38,063.—ELIZABETH T. SHANK, administratrix of the estate of ISAAC R. SHANK, deceased, Buffalo, Putnam county, Va.—*Improvement in Fences*.—Patent dated March 31, 1863.—The rails are square and pass through round mortises in the posts and are secured by keys. The lines of mortises in the posts are on each side of the central vertical line on the faces of the same, and the rails preserve their horizontal line and relative vertical distance, but pass from the outer line of mortise holes in one post to the other side in the next post, and are braced by upright slats with mortise holes through which they pass at points on each side of their central intersection.

Claim.—The arrangement of the braces C C', provided with round holes and fitting on the square rails B B1 B2 B3 B4 B5, which are fastened in the posts A A' by means of keys b b', in different planes, substantially as and for the purpose shown and described.

No. 38,064.—W. HORACE SOPER, of Baltimore, Md.—*Improved School Desk*.—Patent dated March 31, 1863.—The seat is pivoted by a metallic rod to the forward projecting sides of the desk behind it, and may be folded back against the said desk for convenience.

Claim.—The metallic rod by which the seat is hinged and operated, substantially as and for the purpose specified.

No. 38,065.—ABRAHAM STRAUB, of Milton, Northumberland county, Pa.—*Improvement in Cement Roofs*.—Patent dated March 31, 1863.—The roof is covered with wooden sheathing of narrow boards tongued and grooved together, and nailed down with spaces between them on their upper edges, and grooves ploughed in their upper faces for the cement to fill, so that any shrinking cracks shall come in the cement-filled grooves and the continuity of the roof be preserved.

Claim.—Dispensing with the use of the felt or cloth heretofore required in cement roofs, by the employment of the wooden sheathing herein described, the said sheathing being constructed and applied substantially in the manner described and set forth, for the purpose specified.

No. 38,066.—WILLIAM G. STROWGER, of Oswego, N. Y.—*Improvement in Subsoiling Implement*.—Patent dated March 31, 1863.—This machine has two rows of chisel teeth diverging from the forward end and set in a metal plate with handles for the operator.

Claim.—An implement for subsoiling, ditching, &c., composed of a solid metal plate A and teeth B, the latter being fitted in the former, substantially as shown, and the plate provided with handles C C and a clevis B, all being constructed and arranged as herein set forth.

No. 38,067.—HENRY L. SWEET, of Foxboro', Norfolk county, Mass.—*Improvement in Apparatus for Pressing Hats*.—Patent dated March 31, 1863.—The apparatus consists of arrangements for bringing a pressure upon all parts of the hat, which is set in an adjustable socket which impinges upon all the exterior surface of the crown and side and the upper part (as worn) of the rim, and an annular block with a suitably curved lower surface, which presses upon the lower side of the rim, together with a laterally expanding sectional pressure block with an elastic cover which occupies the interior of the hat and is pressed down against the crown of the hat by an annulus with adjusting screws above it. The apparatus is provided with heating chambers in the interior.

Claim.—The combination and arrangement of the crown and side pressers F F', the rim pressers G G' L, and the expansive block I, the whole being constructed and operating together substantially as specified.

Also, the arrangement of the heating chambers D E E with respect to the crown, rim, and side pressers, when the latter are constructed and arranged as specified.

Also, the expansive block I, as formed of separate sections and surrounded by an elastic cover, as described, in combination with its expansive mechanism, and with a mechanism for forcing the block and its expansive mechanism downward into the mould or a hat when in the latter.

Also, the combination of the elastic plate or cushion P, with the rim, crown, and side pressers and the expansive block, as described.

Also, the adjustable crown and side pressers as made in manner and combined with the lower rim pressers, and provided with adjustments, substantially as described, whereby they may be adjusted with reference to the rim pressers and for hats of different heights, as may be desirable.

Also, the combination of the annulus h and its adjusting screws, with the presser L and the expansive block I, constructed and combined with side and crown pressers F F' G G', substantially in manner and so as to operate as specified.

No. 38,068.—DANIEL E. TEEL, of Norwich, Chenango county, N. Y.—*Improvement in Water Elevators*.—Patent dated March 31, 1863.—This is so arranged that by turning the crank one way the projection of the ellipse will catch into the ratchet and cause the drum to rotate; and, by its rotation in the other direction, the projection strikes the pawl and throws it out of gear with the ratchet, allowing the bucket to descend under the pressure of the ellipse, which serves as a brake.

Claim.—The combination of the ratchet C and flanch b, pawl E', ellipse F, provided with the projection c and attached to the crank D, the oval F encompassing the flanch b, and all arranged substantially as and for the purpose set forth.

No. 38,069.—JOHN W. W. TINDALL, of Liverpool, England.—*Improvement in Deodorizing Petroleum, &c.*—Patent dated March 31, 1863.—Where the oil contains paraffine, it is treated with sulphuric acid and stirred, at a temperature of 115° Fahrenheit, for a certain time, after which a portion of nitric or nitrous acid is added, and it is again agitated. Urine is then added and commercial hydrochloric acid, the stirring and a temperature of 105° being maintained. It may then be bleached and distilled. The proportions and operation vary according to the chemical character of the oil, and the temperature is reduced at the latter stages of the process.

Claim.—The employment of urine in combination with mineral acids as described, for the purpose set forth.

No. 38,070.—EMIL TRITTIN, of Philadelphia, Pa.—*Improved Coal Oil Burner.*—Patent dated March 31, 1863.—The plate to which the wick tube is attached is suspended from the collar which screws into the lamp, and the plate (by projections) gives support to the dome, so that the screw is nearly isolated from the parts exposed to the flame.

Claim.—Isolating or partially isolating the screw E from the wick tube and from the dome A by connecting the said screw to the dome, through the medium of arms or projections e e, the plate D attached to the wick tube, and projections d d on the said plate, substantially as set forth.

No. 38,071.—M. LEBRUN VIRLOY, of Paris, France.—*Improvement in Carbonizing Wood.*—Patent dated March 31, 1863.—In this apparatus the wood is introduced at one end of a furnace and withdrawn dried at the other, the doors being hermetically sealed during the operations; the openings in the furnace for the admission and exit of air are regulated by valves, the temperature begin gradually increased and the waste heat utilized.

Claim.—First, so constructing and operating a furnace for drying or carbonizing wood, peat, and other fuel, as that the said fuel is introduced at one side or end of the furnace and withdrawn (suitably dried or carbonized) from the other side, substantially as shown and described.

Second, in combination with a furnace constructed and operated as shown and described, the employment of doors and other openings when so arranged as to allow of their being hermetically closed during the operation, in the manner and for the purposes set forth.

Third, in furnaces for drying or carbonizing wood, peat, or other fuel, constructed and operated as described, the use of taps, valves, and registers in the orifices and covers, to increase or diminish, according to circumstances, the activity of the fuel and the operation, and for regulating the admission and exit of air, gas, and other volatile products, substantially as shown and described.

Fourth, the manner (herein described) of collecting and removing from a furnace for carbonizing wood, peat, &c., a portion of the volatile products after the whole or part of their caloric has been utilized, substantially as and for the purposes set forth.

Fifth, the manner (herein described) of utilizing the waste heat, which, in the ordinary processes of drying and carbonizing, is carried away by the vapors and gas escaping at a high temperature.

Sixth, the method (herein described) of submitting the wood, peat, or other material to be treated first to a low temperature and gradually increasing it to a high temperature.

No. 38,072.—SAMUEL S. WHITE, of Philadelphia, Pa.—*Improvement in Artificial Teeth.*—Patent dated March 31, 1863.—The improvement consists in making horizontal mortises and vertical holes in the rear portions of the teeth, so that the vulcanite base may project into and fill these recesses, and thereby become firmly attached to the teeth or blocks.

Claim.—The combination in a tooth or block of teeth of one or more mortises a, and one or more holes c c, substantially as herein specified.

No. 38,073.—SAMUEL S. WHITE, of Philadelphia, Pa.—*Improvement in Artificial Teeth.*—Patent dated March 31, 1863.—The grooves and projections which are described in the claim, as also the converging holes, are intended to enable the vulcanite base to embrace the tooth or block.

Claim.—First, the combination of the groove a, and ridges b c, extending the whole width of the block or tooth, the ridge c, furthest from the lingual surface, being made more prominent than the ridge b, next the lingual surface, substantially as and for the purpose herein specified.

Second, the arrangement of the holes e l, in the base of the tooth or block, converging toward each other, substantially as and for the purpose herein described.

No. 38,074.—WILLIAM WHITING, of Roxbury, Mass.—*Improvement in Electro-Magnetic Fire-Alarms.*—Patent dated March 31, 1863.—The invention consists in the employment of a series of pyrometers, each one of which is made spiral, and of two different metals, which

twists or changes its form by the different expansibilities of the two metals. These are to be placed one in each room in connexion with a magnetic battery, an indicator, a series of magnetic circuits and an alarm apparatus, so that the increase of heat in any apartment will, by its action on the pyrometer, close the circuit and give notice of the fire and of its locality.

Claim.—The within described combination and arrangement of an indicator to designate the room from whence the alarm proceeds, a series of pyrometers, a magnetic battery, a series of circuit wires and an alarm apparatus, whereby the occurrence and locality of a fire in any part of the building is made known, as set forth.

No. 38,075.—MARTIN WILCOX, of Middleburg, Summit county, Ohio.—*Spattling Machine.*—Patent dated March 31, 1863.—The liquid glaze contained in a trough is pumped up into an upper chamber, from which it is drawn by a faucet and falls through sieves, which divide so as to fall in spray upon the ware which is passed underneath. This is performed in a bonnet to save waste, and the superfluous liquor is collected by a trough in the bonnet and returned to the reservoir.

Claim.—First, the application of sieves or screens for dividing the substance of the glaze and distributing it upon the ware.

Second in combination with the sieves thus used, the bonnet G, trough H, pump B, chamber D, all constructed substantially in the manner and for the purpose set forth.

No. 38,076.—JOHN A. WILKINS, of Chicago, Illinois.—*Improvement in Sewing Machine.*—Patent dated March 31, 1863.—To retain the loop after it has been cast over the spool, a projection is placed upon the front face of the rotating hook of the sewing machine.

Claim.—Combining with, and having upon, the front face of the rotating hook of a sewing machine, and a short distance back of the point of the said hook, a projection or shoulder, substantially as described, to hold back the loop after it has been carried around and cast over the spool, as set forth.

No. 38,077.—RALPH CARKHUFF, of Lewisburg, Union county, Pa., assignor to Himself and LYMAN S. PAINE.—*Improvement in Straw Cutters.*—Patent dated March 31, 1863.—This machine consists of a cutter-box and a knife vibrating on a centre, the lever and guide being cast in one piece and pivoted to an axle on the piece, which, constituting the throat fulcrum, and segment guide, is made fast to the cutting-box. The crosshead on the end of the lever is adjusted to the segment guide by set screws, and the apron or fodder guide is made adjustable relatively to the jaw opening by a set screw.

Claim.—First, the throat piece A, of a cutting-box provided with a fulcrum B, and segment C, when constructed as and for the purpose set forth.

Second, the lever F, provided with the arm L, crosshead E, set screws P P and R, and stud N, as and for the purpose set forth.

Third, making the apron K, adjustable by means of the stud N, and set screw Q, as and for the purpose set forth.

No. 38,078.—JOSEPH T. COMMOSS, New York, N. Y., assignor to TRUMAN W. PEPPER, of same place.—*Improvement in Fire Escapes.*—Patent dated March 31, 1863.—A block with hawser attached is hooked to the parapet of a house. On this hawser a block traverses, having a car suspended from it; from the traversing hawser pass two ropes, one to the ground and the other over the sheave in the upper block, and then to the ground, so that the car may be raised or lowered by men upon the ground, it running upon the hawser.

Claim.—The combination and arrangement of the car *e*, block *d*, ropes *g* and *f*, hawser *c*, and hook block *a b*, the whole constructed and operating substantially as described and for the purpose specified.

No. 38,079.—HIRAM W. HAYDEN, of Waterbury, Conn., assignor to HOLMES, BOOTH & HAYDEN, of same place.—*Improvement in Wick Tubes for Lamps.*—Patent dated March 31, 1863.—The shaft on which the wick-raising wheels are mounted is supported upon a portion of the plate between the two slots through which the wheels project. This portion of the plate is pressed or swaged out so that the shaft is held between it and the straight portion of the wick tube.

Claim.—Forming the bearing or support for the shaft of the wick wheels to turn in, by stretching and bending out the metal of the tube between the slots in which the wick wheels work, so as to embrace the shaft between such bent and stretched portion and the outer flat surface of the wick tube outside of the slots, substantially as and for the purpose specified.

No. 38,080.—A. M. HILL, of Branford, New-Haven county, Conn., assignor to CHARLES A. MILLER, of Philadelphia, Pa.—*Improvement in Locks.*—Patent dated March 31, 1863.—This latch is hung to the lock by means of a stirrup embracing the hub on the pintle, and by two springs, one of which gives the latch an outward and the other an upward movement.

The action of the cross-bar on the lugs at the ends of the stirrup is such as to give a rocking movement, and attach the latch to or detach it from the keeper by partial rotation of the handle.

Claim.—The latch D, hung to the lock, connected to the springs H and H', or their equiv-

alents, and arranged in respect to the hub B, substantially as described, so that a horizontal as well as a vertical movement may be imparted to the outer end of said latch, the whole being combined with a keeper having two inclined planes.

No. 38,081.—OLIVER LUND, of Philadelphia, Pa., assignor to Himself and FREDERICK N. JOHNSON, of the same place.—*Improvement in Securing Artificial Teeth to Bases*.—Patent dated March 31, 1863.—In the posterior upper part of the artificial tooth is a recess extending into the tooth, and this is crossed by a wire which is imbedded into the material of the tooth.

Claim.—Forming, in artificial teeth, recesses with pins arranged across the same and imbedded in the material of which the tooth is composed, substantially as and for the purpose herein set forth.

No. 38,082.—HELEM MERRILL, of New York, N. Y., assignor to Himself and D. D. BADGER, of Brooklyn, N. Y.—*Improvement in Iron Railroad Cars*.—Patent dated March 31, 1863.—The improvement consists in the manner of securing the longitudinal sleepers; the sheet-metal siding and the wooden filling between the ribs of the car, and the ribs of the car to the side sleepers; also in the construction of the roof.

Claim.—First, the longitudinal sleepers A, in combination with the transverse pieces B, the latter being constructed of sheet-metal bent so as to form a rectangular box, or three sides of the same, and secured between the sleepers in proper position by means of the plates *a* and the rods C, all arranged substantially as shown, to form a platform or bed for the support of the flooring and body of the car, as set forth.

Second, connecting the vertical ribs E to the sleepers A at the side of the car by means of the angle brackets F, provided with oblong vertical openings *d*, with pieces of India-rubber *f f* fitted therein, between, which pins *c*, which pass transversely through the ribs E are substantially as and for the purpose specified.

Third, the vertical ribs E, rolled or otherwise formed with three longitudinal grooves *b b' b''* in their sides, in combination with the rods H, sheet-metal siding C', and wooden filling G, all arranged to form the body of the car, substantially as shown and described.

Fourth, the bars or rafters I, rolled or otherwise formed with a groove *i* at each side, in combination with the rods K and plates J, all arranged substantially as shown, to form the roof of the car.

Fifth, the angle or corner ribs E, formed in one piece or of two pieces connected together at their ends at or about at right angles to each other, in connexion with the plates *h* inserted in the grooves *b* of said ribs, to form the rounded or flat corners of the car, as specified.

Sixth, the bars *l* at the ends of the car, fitted on the back parts of the upper ends of the ribs E, and secured in position by the bolts *n*, when said bars, thus arranged, are used in connexion with the roofing of the car composed of the bars I and plates J, as set forth.

No. 38,083.—THEODORE H. SNYDER, of Camden, N. J., assignor to Himself and WILLIAM VAN DYKE, of Philadelphia, Pa.—*Improvement in Regulating the Flow of Gas to Soldering Apparatus*.—Patent dated March 31, 1863.—The flow of gas is regulated by a pivoted valve in the gas pipe, which is operated by a cord connected to a rod which is depressed by a treadle, the range being limited by the contact of a pin on the rod with a notched bolt which moves in and out in a slide attached to the frame.

Claim.—The adjustable notched bolt M, or its equivalent, in combination with the rod H, its projecting pin N and the treadle I, or its equivalent, the whole being arranged for regulating the flow of gas through the pipe B to the burner, substantially as and for the purpose herein set forth.

No. 38,084.—A. A. WILDER, of Detroit, Mich., assignor to RUFUS BROWN, of the same place.—*Improved Machine for Making Hoops*.—Patent dated March 31, 1863.—The timber is sawed of an uniform width by being passed between two circular saws placed on one mandrel, and fed by fluted pressure rollers to a curved plate and racking roller, where it is racked or split into hoops, the operation being continuous.

Claim.—First, the two saws C C and guides G G, in combination with the fluted feed rollers *j j' k k'*, all arranged as and for the purpose specified.

Second, the fluted racking roller *l* and curved plate M, or its equivalent, for the purpose set forth.

Third, the saws C C, in combination with the fluted feed rollers *j j' k k'*, racking roller *l*, and curved plate M, all arranged substantially as and for the purpose specified.

Fourth, sawing, or otherwise bringing to a uniform width, hoops, or timber for the same, and racking or dividing it at one operation.

No. 38,085.—A. A. WILDER, of Detroit, Mich., assignor to RUFUS BROWN, of the same place.—*Machine for Pointing and Checking Hoop Bolts*.—Patent dated March 31, 1863.—This machine points the ends of bolts of timber from which the hoops are to be racked or split, and also for starting the split at the end preparatory to being racked. The former operation is performed by a double bevelled rotary cutter wheel, between the inclined faces

of which the bolt is brought to a point, and the latter operation performed by a checking knife upon the bolt, which lies upon a feed table.

Claim.—First, the cutter wheel D formed of two parts *a a*, bevelled at their inner sides and provided with the cutters *b b*, in connexion with a bolt support or projection *h* fitted in the V-shaped recess between the parts *a a*, all arranged substantially as and for the purpose specified.

Second, the feed table E, with the bar F attached, provided with a half nut *k*, in combination with the screw H, knife *f*, on the cutter wheel D, and the bevelled bar *m*, and button G, or their equivalents, as and for the purpose specified.

Third, the combination of the cutter wheel D with the cutters *b b*, and knife *f* attached, feed table E, screw H, bar F, provided with the half nut *k*, the button G, and bevelled bar *m*, all arranged for joint operation, as and for the purpose herein set forth.

No. 38,086.—JOHN UNDERWOOD, of London, England, assignor to WALDO MAYNARD and CHARLES R. THAYER, of Boston, Mass.—*Improved Process of Copying Writings, Maps, &c.*—Patent dated March 31, 1863.—Patented in England April 20, 1857.—The originals being written or printed with a prepared ink, are brought into contact with prepared paper under pressure, the chemical characters of the ink and paper being such that a chemical action takes place and the characters are copied.

The paper may be written upon with a solution of an extract of logwood, and the copying paper may be treated with a solution of a neutral chromate of potash.

Other preparation are cited as appropriate.

Claim.—First, the method of printing or obtaining copies of documents, forms, maps, plans, designs, or any other characters or marks which may be produced upon paper, parchment, or other similar material, by forming these characters or marks of a prepared ink and bringing them in contact with prepared paper under pressure, the ink and paper being prepared in such manner that when the two are brought together a chemical action takes place, whereby copies of the said characters or marks are produced, as hereinbefore described.

Second, preparing copying ink and copying paper, in the manner and for the purposes hereinbefore described.

No. 38,087.—JAMES S. ATTERBURY and THOMAS B. ATTERBURY, of Pittsburg, Alleghany county, Pa.—*Improvement in Lamps.*—Patent dated April 7, 1863.—This invention consists in attaching a metallic hoop or collar to the neck of a lamp, or other article, while it is in the act of being blown or moulded.

Claim.—First, as a new article of manufacture, a glass lamp, or other article of like material, having a metallic hoop or collar *d* applied thereto, substantially in the manner and for the purpose set forth.

Second, attaching a metal hoop to the collar of a lamp, while the lamp is in the act of being moulded or blown, the lamp, so formed, when withdrawn from the mould, being a complete merchantable commodity in a single piece, substantially as and for the purpose set forth.

Third, making in one piece a glass lamp and collar, substantially as set forth.

No. 38,088.—B. H. BARTOL, of Philadelphia, Pa.—*Improved Shutters for the Port-holes of Iron-clad Vessels.*—Patent dated April 7, 1863.—The object of this invention is to provide a port shutter, which should be an effective bar against the enemy's shot into the port when the gun is withdrawn, and expose but a small portion of the port when the gun is run out. This is accomplished by hanging the half-shutters, independently of each other, to the side of the vessel or battery on shafts passing through the same.

Claim.—The two shutters E and E', hung independently of each other to the side of the vessel or battery, on shafts passing through the same, the said shutters being arranged in respect to each other and to the port, substantially as and for the purpose herein set forth.

No. 38,089.—B. H. BARTOL, of Philadelphia, Pa.—*Improvement in Mounting Ordnance.*—Patent dated April 7, 1863.—The object of this invention is to attain such a ready and variable lateral adjustment of the gun as to admit of its use in connexion with a fixed battery, and obtain the advantages and avoid the disadvantages of a rotating battery; this is accomplished by mounting the ordinary gun carriage on a supplementary gun carriage, which traverses segmental tracks on a turn-table.

Claim.—Mounting the carriage of the gun on a supplementary carriage G, arranged to traverse segmental tracks on a turn-table D, substantially as and for the purpose herein set forth.

No. 38,090.—WILLIAM BEACH, of Philadelphia, Pa.—*Improvement in Drawing or Forging Metal Bars.*—Patent dated April 7, 1863.—This invention consists of a balanced revolving hammer, acting upon an adjustable anvil in a suitable supporting frame, for the purpose of producing a combined rolling and pounding effect in drawing and forging.

Claim.—The combination consisting of the balanced revolving hammer A and the adjustable anvil B, the same being constructed, arranged, and supported, so as to operate together, substantially in the manner described and for the purpose specified.

No. 38,091.—JULIUS A. BIDWELL, of Sturges, St. Joseph county, Mich.—*Improvement in Bases for Artificial Teeth*.—Patent dated April 7, 1863.—The invention consists in the employment of a flexible air-chamber upon, and made a part of, the base of the set of artificial teeth to attach it to the palate.

Claim.—The employment, upon the bases of artificial teeth, being a part of the base itself, of a flexible air-chamber or intervening medium, for the purposes and uses expressed, and in the manner substantially as set forth.

No. 38,092.—A. E. BOYNTON, of Hartford, Washington county, Wis., and G. R. BOYNTON, of Chicago, Cook county, Ill.—*Improved Stump Pulling Machine*.—Patent dated April 7, 1863.—This improvement consists of a powerful lever, which is adapted to be attached to stumps by chain or otherwise, and then being depressed by ropes to raise them. The various arrangements claimed are for adapting the lever to varying requirements of power by setting its fulcrum nearer or further from the end; the arrangement of the ropes for operating the lever and the means used in loading for transportation.

Claim.—First, the fulcrum *g*, or its equivalent, when used substantially as and for the purpose above described.

Second, the mode of operating the lever *E* by means of the ropes *t* and *r*, when used substantially as described.

Third, the combination of the several parts, when used as and for the purposes hereinbefore described.

Fourth, the manner of loading said machine for transportation, when done in the manner substantially as herein described.

No. 38,093.—ROBERT D. BROWN, of Covington, Fountain county, Ind.—*Improvement in Automatic Grain-binders*.—Patent dated April 7, 1863.—This machine has devices for applying the band around the gavel; for insuring the correct position of the twisting mechanism, to receive the end of the band; for holding and twisting the ends of the band; for imparting motion to the twisting mechanism, so as to secure its hold upon the band; for tucking the knot; for casting the finished sheaves into a common receptacle; for depositing the finished sheaves into heaps upon the ground; and for counting the sheaves and depositing them in heaps of any required number. But the various devices involved in these complicated movements do not admit of a brief description.

Claim.—First, in combination of a cradle *B*, of any suitable construction, the arms *C C'* attached to shafts *c c*, geared together by the wheels *c'*, and rotated at proper intervals by a cogged segment *c5*, to elevate the arms *C C'*, and carry the band around the compressed gavel.

Second, the combination of the cam-wheel *c2* with the arms *C C'*, for securing the band in the jaws *c4*.

Third, in combination with the arms *C C'*, constructed and operating substantially as herein described, the employment or use of two pairs of gripping or twisting jaws *D D*, attached by separate pivots *d d* to a common journal *D'*, and operating substantially as and for the purpose set forth.

Fourth, driving the jaws *D* by the shaft *E*, working within the hollow journal *D'*, in the manner explained, to compress the said jaws with force corresponding with that required to rotate them.

Fifth, the combination of the spring-stop *k2*, cam *e2*, and wheels *I* and *k*, when the said parts are constructed, arranged, and operate in the manner and for the purposes herein specified.

Sixth, the tucking band *f*, advanced and rotated simultaneously in any manner, substantially as described, for the purpose of tucking the twisted ends under the band.

Seventh, the claw *f'*, employed to hold the band against the pressure of the tucker *f*, as explained.

Eighth, the combination and arrangement of the shafts *F F'*, yokes *f2*, pinions *f3 f4*, guides *H*, and segment racks *h*, to impart the required motion to the tucker *f*, and claw *f'*, substantially as set forth.

Ninth, the arm *G*, provided with a cogged segment *g'*, and employed to advance the shafts *F F'* intermittently, in the manner and for the purposes explained.

Tenth, the segment cog wheel *I i i'*, constructed as described, in combination with the twisting jaws *D*, and tucker *f*, or their equivalents.

Eleventh, the arm *L*, or its described equivalent, for casting the finished sheaf, substantially as explained, when used in the described combination with the pivoted table *N* or *N2*, or other suitable receptacle for carrying the sheaves and depositing them in heaps.

Twelfth, the pivoted table *N* or *N2*, fixed in slanting position and adapted to tilt automatically, in the manner described, for depositing the finished sheaves in heaps upon the ground.

Thirteenth, the curtain *P* or *P2*, operated by the falling and rising of the table *N* or *N2*, in manner substantially as and for the purposes set forth.

Fourteenth, the mode of combining the worm *s2*, and slotted disk *O*, or any substantially equivalent devices for counting the number of sheaves to be deposited in each heap, with an automatic binding machine, substantially as herein described.

No. 38,094.—ROBERT D. BROWN, of Covington, Fountain county, Ind.—*Improvement in Self-rakers for Harvesters*.—Patent dated April 7, 1863.—The grain as it falls upon the platform is allowed to collect, until it is thrust by a continually revolving rake into a cradle, which grasps and deposits it on the ground under the platform. This rake is attached to a number of endless bands suitably driven and passing over and around the platform, and the fingers are elevated and depressed by crank-arms, attached to the journalled rake-heads, projections on said crank-arms working in slots on the inside of the framing of the machine; thus the rake teeth are vertical while pushing the gavel to the cradle and lie back as they pass in their return motion underneath the platform. The cradle consists of a couple of revolving shafts with fingers upon them which form a cradle, into which the gavel is pushed by the rake, and being rotated towards each other it is grasped, carried down between them, and dropped under the platform.

Claim.—First, the continuously revolving rake B, carried forward over the platform and back beneath the same by means of driving-chains, belts, or their equivalent, and elevated to its working position during its forward motion, and retracted in passing beneath the platform by means of the crank-arm D, working in the eccentric or irregular slot *d*, as herein described, and for the purposes specified.

Second, the intermittent cradle F *f*, operated as described, in combination with the continuously revolving rake B, for the purposes set forth.

No. 38,095.—HUGH M. COCHRAN, of McConnellsville, Morgan county, Ohio.—*Improvement in the Manufacture of Chewing Tobacco*.—Patent dated April 7, 1863.—The objects of the process are to impart flavor and a glossy appearance to the tobacco, and to prevent its moulding. These are accomplished by processes so fully explained in the claim as to require no further explanation.

Claim.—First, curing or sweating tobacco previous to its being put “in case,” by exposing the same to a free circulation of heated air, substantially as set forth.

Second, combining with the curing of tobacco, previous to being put “in case,” the preparing of the moulds with a flavoring liquid, whereby the appearance and taste of the product is greatly improved, while its easy delivery from the mould is thereby secured, substantially as set forth.

Third, combining with the curing and sweating of tobacco, previous to being put “in case,” and the pressing the same into moulds coated with a flavoring liquid, the submitting of the tobacco to a second press previous to its being packed ready for market, substantially as set forth.

No. 38,096.—JAMES R. DEY, of Hudson City, N. J.—*Improvement in Friction Matches*.—Patent dated April 7, 1863.—The invention consists in pointing the ends of match-splints so as to reduce the amount and bulk of the inflammable composition covering them. The point of the splint is previously burred or upset, so as to form a better surface for attachment of the composition.

Claim.—The pointed friction match, substantially as described, the point being of a conical, pyramidal, three-sided, or bayonet form, or other analogous form, as set forth.

Also, burring the point of the pointed match-splint, substantially as and for the purposes described.

No. 38,097. SAMUEL F. DICKINSON, of New York, N. Y.—*Improvement in Ruffles*.—Patent dated April 7, 1863.—The strip is ruffed and stitched, and then fastened to a band by another series of stitches.

Claim.—As a new and useful article of manufacture, a machine-made ruffle in which a strip of cloth is first ruffed and the gathers or plaits secured by stitching, and the ruffled piece then fastened to a band by one or more additional independent series of stitches.

No. 38,098.—GEORGE DOUGLASS, Scranton, Luzerne county, Pa.—*Improvement in Railroad Frogs*.—Patent dated April 7, 1863.—The movable side rails are attached by a bolt with springs and an intermediate collar. The point of the frog is supported by an underhanging lip on a flat chair, and the side rails are adjustable laterally independently of the point.

Claim.—First, combining the movable side rails of a railroad frog with each other (independently of its point) by means of a connecting bolt H and intermediate stay or collar G, substantially in the manner and for the purpose herein set forth.

Second, the combination and arrangement of the lateral springs O O, or their equivalents, with the side rails R R' of a railroad frog, substantially in the manner and for the purpose herein set forth.

Third, fastening and securing in its proper position the tapering end of the point K of a railroad frog, by means of an underhanging lipped projection *t* and receiving chair M, substantially as set forth.

Fourth, combining the vibrating rails R and R' with the point K of the improved railroad frog, substantially in the manner and for the purpose herein set forth.

No. 38,099.—JAMES K. DUGDALE, of Richmond, Ind.—*Improved Method of Actuating the Feeding Apparatus of Seed Planters*.—Patent dated April 7, 1863.—The sliding piece, which is connected by a rod with the feeding apparatus, consists of an anchor-shaped yoke which slides on guides, and is moved by the contact of pins on a revolving disk connected with the driving wheel.

Claim.—The sliding device D, in combination with the frame C and wheel B, when used in connexion with the feeding mechanism of a seed planter, as and for the purpose set forth.

No. 38,100.—Captain R. N. EAGLE, of Washington, D. C.—*Improved Hopples for Horses and other Animals*.—Patent dated April 7, 1863.—The improvement consists in the attachment of horizontal bars to adjacent sides of the leg bands as worn, so as to admit of a limited play of the connecting strap without rotating the leg bands.

Claim.—Constructing hopples for fettering animals with bars B B, adapted to permit a limited motion of the attached ends of the strap or cord D, independently of the leg band, and without turning or slipping the latter.

No. 38,101.—D. EARLE, of Palmyra, Portage county, Ohio.—*Improved Magnetic Razor-straps*.—Patent dated April 7, 1863.—The opposite sides of the strap are occupied by an elastic and a non-elastic hone, respectively, with a spiral coil between the two. The latter is made of spring-tempered steel, with an amalgam of emery and oil and the flexible side of a thin plate of steel with a surface of oil and peroxide of iron. The steel in each case is rendered permanently magnetic, by which the blade is held more firmly to the face of the strap.

Claim.—The herein-described permanently magnetic hone, when the same is constructed substantially in the manner and for the purpose herein specified.

No. 38,102.—WILLARD T. EDDY, of West Hoboken, Hudson county, N. J.—*Improved Lamp-heater*.—Patent dated April 7, 1863.—The invention consists of a lamp chimney with holes at the bottom to fit several burners, and with holes on the top of the bulb to set vessels on, or a chimney to convey away the volatile products of combustion.

Claim.—First, a lamp chimney having two or more openings in its bottom to fit simultaneously to two or more burners, substantially as and for the purpose herein specified.

Second, the arrangement of two or more holes *e e'* in the top of the bulb E of a lamp chimney, substantially as and for the purpose described.

No. 38,103.—EDWARD P. FARNUM, Ijamsville, Frederick county, Md.—*Improvement in Slate Roofing*.—Patent dated April 7, 1863.—Upon and in line with the rafters of the roof are laid bearings with grooves on their upper side. The slates rest with their edges on these rafters, and are tied to the roof by staples, which project through the slate roofing and keys which rest upon the slate; the slates are supported in the middle by wedges upon the lath.

Claim.—First, the combination of the rafters A, bearings D, and slates E, all arranged in the manner substantially as and for the purposes herein specified.

Second, the described combination of the longitudinally grooved bearings D *d d* with slates laid and arranged as above set forth.

Third, The staple H and key I applied in the manner explained, in combination with slates E and bearings D *d d*.

Fourth, the transverse bars J and wedges K, employed in combination with the slates E and staples A, in a manner and for the purposes explained.

No. 38,104.—JOHN FONDA, of Albany, N. Y.—*Improved Harness Saddle-tree*.—Patent dated April 7, 1863.—The check-hook is bolted underneath the front bow in a recess of the metallic tree, and the cantle is socketed in a recess behind the head of the bolt which fastens the check-hook to the tree.

Claim.—Forming an elevated recess *a* above the arch of the front bow, and attaching the cantle piece in a socket or cavity behind the bolt hole or the front bow above said elevated recess, substantially as and for the purpose herein specified.

No. 38,105.—HEMAN GARDINER, of New York, N. Y.—*Improvement in Railroad Car Springs*.—Patent issued April 7, 1863. Antedated November 20, 1862.—The spiral springs in the box are surrounded by a packing of fibrous material, and the plates above and below them have projections which enter the cylindrical springs; the spring-box is imposed upon a semi-elliptical spring, whose ends rest upon the truck frame.

Claim.—First, the use of the semi-elliptic spring supported on a bed-plate between the flanges B, in combination with the box D, arranged and operating substantially as hereinbefore set forth.

Second, the use of the plates E and H, having short studs or pins F I in their opposing faces, as hereinbefore set forth, in combination with the spiral springs G and box D, arranged and operating in combination with the semi-elliptic spring, substantially as hereinbefore set forth.

Third, the use of wool, or other fibrous material of a similar nature, packed in a cylinder or box, in combination with the spiral steel springs, for the purposes hereinbefore set forth.

Fourth, the use of the semi-cylindrical bearings K on the truck plate, in combination with

the cap plate E working in the cylindrical box D and resting upon the spiral springs, for the purposes hereinbefore set forth.

No. 38,106.—JOHN S. GILBERT, of New York, N. Y.—*Improvement in Submarine Harbor Defences*.—Patent dated April 7, 1863.—A frame-work of wood, containing a tank capable of containing air for buoyancy or ballast for sinking the same, is connected by chains with similar structures across the entrance of a harbor, or in the channel to be obstructed.

Claim.—The construction of two or more sections, in the manner herein described, in combination with tanks, for the purposes of either imparting buoyancy or ballasting the same while being raised or sunken; and also connecting the said sections together with a series of chains, as and for the purpose herein set forth.

No. 38,107.—ABRAHAM W. HARRIS, of Providence, R. I.—*Improvement in Treadle Motion*.—Patent dated April 7, 1863.—The object of this improvement is to move the crank of the driving shaft of the sewing machine off the centres and prevent its being turned in the wrong direction. This is accomplished by attaching a vibrating arm to the straight part of the crank shaft, having a pawl within it that binds upon the shaft. The arm is connected to an independent treadle by a pitman which is located on the same axis rod as the crank treadle. The auxiliary treadle is provided with a toe-stop to hold it in position.

Claim.—A pawl or pawls acting by means of an independent treadle, in combination with the crank and crank treadle of sewing machine tables, as herein set forth.

No. 38,108.—R. HAYNES, of Oberlin, Ohio.—*Improvement in Portable Fences*.—Patent dated April 7, 1863.—Each panel has two rails, to which are nailed slats in lattice form or otherwise. At one end these rails project beyond a post, to which they are attached, so as to give support to the rails of the next panel, which are pivoted to them by a common pintle passing through a vertical hole in each, and at the other end they have a post set between them to brace them and preserve their distance. Thus each panel is hinged to the post of its neighbor, and the fence is set up with sufficient "worm" to prevent upsetting.

Claim.—The herein-described construction of the panels of a portable fence, in combination with the uniting the same by means of the pins H H, passing through the holes in the rails B B', substantially as herein set forth.

No. 38,109.—SILAS HEWITT, of Seneca Falls, N. Y.—*Improvement in Clod Crusher*.—Patent dated April 7, 1863.—This machine consists of a rotating toothed cylinder journaled in a frame, and having clearers attached to the rear transverse bar, which project forward between the teeth to remove the soil which may have been collected in the intervals between them.

Claim.—The adjustable clearers E, arranged as shown, in combination with the toothed cylinder D, for the purpose specified.

No. 38,110.—JAMES C. C. HOLENSHADE.—Cincinnati, Ohio.—*Improvement in Ordnance*.—Patent dated April 7, 1863.—The invention consists in constructing the tapering-breech piece with helical bearing plates at each end to bear against corresponding helical faces on the sides of the chamber or breech cylinder which contains the coned or faucet breech-piece, so that in turning the breech-piece to receive the charge, the helical faces draw it laterally to relieve it from adhesion, and in turning it to bring the charge opposite the bore of the gun, the breech-piece is forced laterally, and tightened against the gun to prevent the escape of gas.

Claim.—The two plates, one on each side of the breech cylinder which surrounds the faucet breech containing the charge, provided with oblique faces or sections of metal in one or more pieces around the breech, and securely connected to it, and working against counter plates in the sides of the breech cylinder, so as to release and tighten-up the faucet breech, and bring the chamber containing the charge opposite the bore of the gun in firing, as described.

No. 38,111.—JACOB HOVEY, of Cleveland, Ohio.—*Improvement in Spark Arresters*.—Patent dated April 7, 1863.—The smoke box is divided into two compartments by means of a horizontal partition of wire-gauze, placed immediately above the flues; part of the said diaphragm, consisting of a plate which deflects the sparks so that they fall to the bottom of the chamber.

Claim.—First, the screen or diaphragm H, in the smoke-box A, arranged as and for the purpose specified.

Second, the deflector H', when arranged as and for the purpose set forth.

No. 38,112.—HENRY KNIGHT, of Brooklyn, N. Y.—*Improvement in Combination, Cement, and Metallic Pipes*.—Patent dated April 7, 1863.—The sections of wrought-iron tube are frustums of cones so as to enter and embrace the tubes at their respective ends. They are cased and lined with cement and have iron-champing rings, through which holes may be made for branch pipes.

Claim.—The application and use of wrought-iron frames or tubes of the form of a tran-

cated cone at one end or along their whole length, to pipes lined or coated with hydraulic-cement mortar, or both lined and coated, for the convenient joining of the same in their several lengths, and at the same time retaining the cylindrical form and finish.

Also, the application and use of metallic tapping rings, bosses, or thimbles, to pipes of wrought iron, lined or coated with cement mortar, or both lined and coated, substantially in the manner and for the purpose described.

No. 38,113.—GEORGE LITTLETON, of Cleveland, Ohio.—*Improvement in Printer's Ink Rollers*.—Patent dated April 7, 1863.—The roller is made in two parts, one end being a collar on the other. Each end has an annular flange, and between them are bearings to support the covering which is stretched from one flange to the other. There are also wires under the covering to preserve the rotundity of the roller; the tension of the covering is adjustable by a temper screw at the end of the collar.

Claim.—The construction and arrangement of the roller A and collar C, with the flanges B and D, the screw and nut E, pin *f*, counterbalance *g*, bearers H H H H, wires I I, cushions K, and the prepared rubber surface L, in the manner herein described and for the purpose set forth.

No. 38,114.—L. MANCY and C. BRANZER, of St. Morgan, Madison county, Ill.—*Improvement in Crushing and Stripping Sugar Cane*.—Patent dated April 7, 1863.—The stalks are laid on notched bars, where they are exposed to rotating knives which strip off the leaves preparatory to the stalks being fed between the rollers which are arranged in standards on each side of the machine. The feed table and the inclined discharging apron which carries away the bagasse are suspended by arms from the central standard, so as to slope towards the crushing rollers.

Claim.—First, the pressure rollers C D D', two or more, in combination with the endless inclined discharging apron *j*, rotary knives *j*, guide bars G H, and inclined table E, all arranged for joint operation, as and for the purpose herein set forth.

Second, the manner of holding or sustaining the table E and inclined endless apron I in inclined positions, to wit, by means of the arms *h h t t*, connected to the uprights B B, as set forth, in combination with the guide bars G H, notched as shown; rotary knives *j*, table E, and the pressure rollers C D D', all arranged for joint operation, substantially as and for the purpose herein set forth.

No. 38,115.—JOHN F. MORGAN, of Boston, Mass., assignor to Self and GEORGE W. WALKER.—*Improvement in Turning Edges of Plates or Metal Sheets*.—Patent dated April 7, 1863.—This machine consists of a folder and movable table, so that the sheet of metal may be withdrawn after the edge is bent up without moving it back over the folder as is necessary where the table is stationary.

Claim.—The combination of the movable folder B and the platform C with the gears DD and racks E E, or equivalent machinery for moving the said platform, in manner and by movement of the folder, substantially as specified.

Also the application of the folder on the platform-moving mechanism by means which will admit of the folder being moved or turned without creating, in the mean time, any movement of the platform.

No. 38,116.—JOHN MARSDEN, of Orrell, England.—*Improvement in Manufacturing Nuts, Bolts, &c.*—Patent dated April 7, 1863.—The rod of heated iron is passed through the vice and into the nut die, and there gripped; the punch is then brought into action, driving the central piece out of the nut and leaving it on the end of the bar; the punch is then withdrawn and the nut released. When the machine is used for making bolt-heads, the parallel punch is withdrawn and a plug placed in the end of the hollow ram.

Claim.—First, the making, forging, and punching nuts and washers, without waste of metal, from round rod or bar-iron, or other metal, by the combination of mechanical parts put together and working essentially as hereinbefore described and shown.

Second, the making of bolts or spikes by and with the combination of mechanical parts, the modification herein directed being previously made, put together, and working essentially as hereinbefore described.

No. 38,117.—J. M. H. P. MÉTIVIER, of Paris, France.—*Improvement in Pumps*.—Patent dated April 7, 1863.—This invention consists of a horizontal disk, to which are suspended, by elastic diaphragms, two or more pump cylinders. The disk is rotated by a vertical shaft from above, and at the point of its attachment to the disk is connected by a universal joint to an inclined shaft, which is stepped into the bed plate of the frame. On this shaft is a cross-head at right angles to the shaft, and to it are attached piston-rods carrying pistons, which project up into the pump cylinders depending from the disk. The pistons are provided with valves opening upwards, as are also the upper ends of the pump cylinders, and by the revolution of the two shafts, the disk, and the cross-head, the pistons discharge the contents of the cylinders as they approach the upper portion of their revolution, the cylinders filling again as the pistons are again receded.

Claim.—The employment in pumps of two shafts jointed together, and of inclined pump barrels and pistons, all being fitted and caused to act substantially as hereinbefore described and illustrated in the accompanying drawings.

No. 38,118.—WARREN P. MILLER, of Marysville, Yuba county, Cal.—*Improvement in Operating Ordnance in War Vessels.*—Patent dated April 7, 1863.—The gun carriage is mounted upon screws which traverse sockets in the bed plate of the carriage and extend from the bottom of the hold to the requisite elevation for the gun to be ranged with the port-hole. This permits the gun to be upon the lower, intermediate, or gun deck, for ballast, loading, or firing. The details are fully explained in the claim.

Claim.—First, the combination of the movable hatches *r r* and boxes *s s* with the screws *i i*, gearing *j k l*, and nuts *t t*, the whole being constructed, arranged, and employed in the manner herein set forth, to raise the gun above the upper deck for firing, lower it to the intermediate deck for loading, and, when not in use, deposit it in the lower part of the hold as ballast, the hatches, when in position, serving also to preserve the screws from deflection, as explained.

Second, the sliding hatches or gates *P' P''*, formed respectively with a concavity 1 and a projection 2, in the described combination with the curb *d* of the turn-table, for the purposes specified.

Third, the combination with the turn-table *c* of the removable shaft *g* and sliding capstan *h*, as herein shown and described, for the purpose of training the gun when elevated and permitting its descent either on, to, or below the intermediate deck, as described.

No. 38,119.—STEPHEN A. MORSE, of East Bridgewater, Plymouth county, Mass.—*Improvement in Drill Bits.*—Patent dated April 7, 1863.—The side of the spiral groove in the bit stock which makes the cutting edge has an acute angle, and the other side of the groove is radial to the axis of rotation. The groove has an increase twist towards the point.

Claim.—A twist drill in which the spiral grooves are so cut or formed that the curvature of that side of the groove which makes the cutting edge is very nearly in the direction of the radius, and, when the drill is ground at the ordinary angle, presents a straight and acute-angled edge or lip to the metal or other substance which is to be drilled.

Also, in combination with the form of the drill as above set forth, the increasing twist, to facilitate the discharge of the borings or chips.

No. 38,120.—ELI ODELL, of Winterset, Madison county, Iowa.—*Improvement in Straw Cutters.*—Patent dated April 7, 1863.—The V-shaped cutters are arranged at the bottom of the hopper, and the cutters, arranged on a revolving cylinder, impinge upon them to divide the straw.

Claim.—The arrangement of a series of knives in a spiral form, mounted on a cylinder in a horizontal position, and said knives so reversed as to work in combination and match with the stationary cutters V on the bottom of the hopper, for the purpose herein set forth and described.

No. 38,121.—WILLIAM G. OLIVER, of Buffalo, Erie county, N. Y.—*Improved Propeller Blades.*—Patent dated April 7, 1863.—The improvement is in the shape of the blade, the shank of which is socketed to the hub, and consists of a raised screw curve on the face of the blade, extending across the shank.

Claim.—Making a raised screw curve or projection upon the face of the blade, and extending on, to, and crossing the shank and terminating outwardly and upwardly in an angle as represented in the drawings at A2, for the purposes set forth.

No. 38,122.—JULIUS A. PEASE, of New York, N. Y.—*Improvement in Caoutchouc Shirt Collars.*—Patent dated April 7, 1863.—Explained by the claim.

Claim.—A shirt collar made of rubber, that will resume its position when bent or forced out of place, substantially as before and for the purpose described.

No. 38,123.—JABEZ J. PIGGOTT, of St. Clair county, Ill., and C. L. CROWELL, of Peoria county, Ill.—*Improvement in Harvesters.*—Patent dated April 7, 1863.—This machine is suspended from two wheels which are coupled to a fore carriage. The reciprocating motion of the cutters is given by a revolving shaft, which has cam-shaped grooves in which the heels of the cutter stocks slide. The platform of the machine is suspended outside of the wheels by chains operated by levers, and the motion of the cutters derived from a spur on the main driving wheel communicated through pinions to the cutter shaft. There are a number of minor points of construction and adjustment set forth in the claim.

Claim.—First, a shaft I adapted to the location shown, and provided with converse-acting cams T U, in combination with converse-acting cutters, in the manner and for the purpose described.

Second, the combination of the revolving shaft I T U, radial arms K, and gearing of the draught frame with the upper and under cutters, all constructed, arranged, and operating substantially in the manner and for the purpose described.

Third, so fitting the reel supports to guides *f f* in the draught frame, that they are both

guided and stayed above the points where they are fastened in the finger beam, substantially as described.

Fourth, the draught frame, constructed substantially as described, so that it may be increased or decreased in width, for the purpose set forth.

Fifth, the swinging radial arms M on the hind axle, substantially as and for the purposes set forth.

Sixth, the back beam L, in connexion with the swinging radial arms M, suspending and adjusting lever P', and grain end of the finger beam, substantially as and for the purposes set forth.

Seventh, the arrangement of the back beam L and the finger beam H on the side draught frame, so that they may be adjusted from the one driver's seat, either separately or together, substantially as and for the purposes set forth.

No. 38,124.—W. F. QUIMBY and G. G. LOBDELL, of Stanton and Wilmington, Del.—*Improvement in Cultivating Machines*.—Patent dated April 7, 1863.—The cultivating toothed roller is mounted on a frame on wheels, and is succeeded by a pulverizer; the digger teeth are presented to the ground by an arrangement of a central cam, a rope, and a windlass, and are vibrated so as to cast off the raised soil as they ascend from contact with the surface.

Claim.—The arrangement and combination of the windlass *l*, levers G, digging cylinders D with teeth *h*, attached to fixed or oscillating bars, pendent arms *k*, pulverizing cylinder J, and windlass *p*, all constructed and operating in the manner and for the purpose set forth.

No. 38,125.—EDWARD S. RITCHIE, of Brookline, Mass.—*Improvement in Mariners' Compasses*.—Patent dated April 7, 1863.—The invention is applicable to liquid mariners' compasses provided with an air vessel combined with the magnet or its card, to insulate it and buoy it up to lessen the weight on the supporting pivot or bearing. It consists in the combination of an auxiliary air vessel or indicator, and a connecting rod with the magnet and its air vessel, the whole arranged within a case. The air vessels are connected with their shaft by gimbals, and there are other points of adjustment which are sufficiently explained by the claims.

Claim.—The combination of the auxiliary air vessel or indicator E, and the connecting rod B, or mechanical equivalents therefor, with the magnet or magnets *g*, or the same, and its or their air-tight or buoyant case D, the whole being arranged within the vessel or case A, to contain water or other proper fluid, and so as to operate together substantially as above specified.

Also, the combination of either or both the bouyant air vessels D E, with their shaft or rod B, by means of gimbals *h*, or their mechanical equivalents, the shaft or rod B being arranged and supported within a case A, substantially in manner and so as to operate as described.

Also, the combination of an auxiliary buoyant vessel *e*, or its equivalent, with the rod or connector B, the magnet or the same and its buoyant case D, and the auxiliary case or indicator E, as arranged within a case or vessel A, containing water or other suitable fluid, and so as to operate therein substantially as hereinbefore specified.

Also, the improvement of arranging the cardinal divisions on the external periphery of the circular indicator E, substantially as specified.

Also, the combination and arrangement of a hollow globe *b2*, open at top and bottom, and its supporting gimbals with the water case or vessel *a*, and the magnet buoyant vessel therein.

Also, the magnet air vessel as made of an elongated form, and as having its magnet or magnets arranged lengthwise within it, substantially as represented in Figs. 6, 7, and 8 of sheet 1, and as hereinbefore specified.

Also, the combination of two or more buoyant radial floats or arms *a2 a2* with the elongated magnet vessel, the said arms being for the purpose hereinbefore stated.

Also, the combination of a graduation ring *f* with the radially-armed float E, its connecting rod B, and the magnet float D, when arranged and combined within a water vessel A, in manner and so as to operate substantially as described.

No. 38,126.—EDWARD S. RITCHIE, of Brookline, Mass.—*Improvement in Mariners' Compasses*.—Patent dated April 7, 1863.—The bowl in which the floating magnet is contained is provided with division plates to keep the magnet from contact with the sides of the bowl, which is connected with an auxiliary elastic chamber containing water. The magnet is attached to the cross-bar or radial arm of an open ring which has the cardinal points and divisions on the cross-bars and the inner face of the ring.

Claim.—The combination and arrangement of a series of divisional plates E E, or their mechanical equivalent or equivalents, with the bowl or liquid case A, and the magnet, or with it and its supporting card or float B, the purpose of the said plates being as described.

Also, the combination of one or more either flexible or elastic-expansion chambers or vessels C with the bowl or water case A, containing a magnet and float or card, as specified.

Also, the combination and arrangement of an open divisional ring *c* with the magnet M, its float B, or with the same and the radial arms *b b*, the whole being substantially as specified.

Also, the arrangement of the cardinal divisions, viz., on the inner face of the divisional ring *c*, or on the same, and the magnet case B, or the latter and the radial arms *b b*, as specified.

No. 38,127.—ALMON ROFF, of Bridgeport, Conn.—*Improvement in Fortifications*.—Patent dated April 7, 1863.—The invention consists in the form and arrangement of cast-iron blocks made with corresponding tongues and grooves in the adjacent faces, so as to interlock and form a structure to resist projectiles.

Claim.—The arrangement of the cast-iron grooved and tongued blocks to be used in the construction of fortifications in the manner substantially as herein set forth and described.

No. 38,128.—JEREMIAH ROUTH, of Grayville, White county, Ill.—*Improvement in Combined Smut Machine and Separator*.—Patent dated April 7, 1863.—The grain is exposed on a vibrating shoe which contains two inclined screens, from whence it is passed by a spout into a chamber where it is exposed to a revolving armed cylinder and a blast of air from a fan.

Claim.—The shoe J, provided with screws K L, which divide it into compartments M N O, terminating at their lower end into discharge spouts *g h i*, respectively, and vibrating on hinge R, in combination with the case A, scouring cylinder E, shaft G, and crank wheel I; when the whole are arranged in the manner and for the purpose specified.

No. 38,129.—L. RUNDELL, of Coxsackie, N. Y.—*Improvement in Horse Elevating Fork*.—Patent dated April 7, 1863.—The arm by which the fork is suspended from the hoisting rope is retained by a catch from which a cord depends to the operator, who in withdrawing the catch causes the tines to vibrate and discharge the load.

Claim.—The combination of the bail E, arm F, or its equivalent, and the catch I, when arranged relatively with each other and the fork, or the head A, thereof to operate as and for the purpose herein set forth.

No. 38,130.—JOHN RUSSELL, of Boston, Mass.—*Improved Portable Dressing Case*.—Patent dated April 7, 1863.—This consists of an assemblage of useful articles in a case with a spring-jacket and clasp around the case in which they are enclosed or to which they are attached.

Claim.—The socketed spring-jacket D, and the vessel, cup or case A, constructed in manner and so as to contain or have combined with it articles substantially as specified.

No. 38,131.—JOSEPH B. TILLINGHAST, of Racine, Meigs county, Ohio.—*Improvement in Portable Fences*.—Patent dated April 7, 1863.—These panels are constructed with the posts all on one side, and with the second and fourth boards prolonged at one end and shortened at the other, so that, in setting up the fence in a zigzag, the prolonged boards of one panel are introduced through the spaces in the next panel, and are there locked by the engaging of the posts on the respective panels.

Claim.—The panels having the posts all one side provided with the extension rails L fitting into the spaces K, with the post E interlocking with the post H, all constructed in the manner and for the purpose set forth.

No. 38,132.—E. W. VAILL, of Worcester, Mass.—*Improved Folding Chair*.—Patent dated April 7, 1863.—The back is hinged at the junction of the seat so as to fall forward, and the X-shaped legs collapse.

Claim.—First, the application of the folding back D' H to a camp stool or chair, such as described in letters patent granted to me on the sixth day of January, 1863.

Second, in combination with a camp stool or chair substantially as herein described, the hinges J J applied to the front edges of the back pieces D' and legs D, and secured by flanges or plates *j j* let into the wood and bolts, pins, or screws passing transversely through the same as specified.

No. 38,133.—GEORGE WEBER, of Newark, N. J.—*Improved Skate Fastening*.—Patent dated April 7, 1863.—The skate is provided with catches in front to embrace the toe of the boot, and an adjustable socket behind to clasp the heel. By the vibration of the lever the heel is brought forward against the points which impinge against its front and the toe firmly pressed against the clasp in front.

Claim.—The cramps and catches constructed and arranged in the manner and for the purpose specified when the same are used in combination with the lever *c*.

No. 38,134.—J. N. C. SAVELS, of Stoughton, Norfolk county, Mass., assignor to BENJAMIN D. GODFREY, of Milford, Mass.—*Improved Stocking Heel Protector*.—Patent dated April 7, 1863.—This consists of a semi-spherical bag to be worn over the heel, with an elastic strap which passes around the foot to retain it in position.

Claim.—As a new article of manufacture, a heel protector made to fit upon and be worn over the heel of a stocking as above described.

No. 38,135.—DAVID SHATTUCK and JOHN SHATTUCK, assignors to the WHIPPLE FILE MANUFACTURING COMPANY, of Cambridge and Malden, Mass.—*Improved Machine for Cutting Rasps*.—Patent dated April 7, 1863.—The file blank is placed in a vertically sliding stock and the cutter caused to traverse across the face of it by the revolution of a cam.

Claim.—Arranging the cutter upon a traversing carriage and moving the same across the

face of the rasp with a changing motion for the purpose of placing the teeth in rows, as set forth.

Also, in combination with the above cams H4, operating as set forth, for the purpose described.

No. 38,136.—CHARLES H. STONE and CHARLES W. LIVINGSTON, of South Groton, Middlesex county, Mass.—*Improved Burglar Alarm*.—Patent dated April 7, 1863.—This alarm, which consists of a combination of ratchet wheels, pawls, &c., detailed in the claim, is intended to be sprung by a burglar opening the door of a room provided with the necessary attachments.

Claim.—The combination of the spring *a* and wheel *c*, the pawl *k*, the wheel *d*, and the double pawl *e*, with the hammer *f*; also, the combination of the lever *i* with the stop *h*, and crank *g* with the start *f*, constructed and operating substantially as described and for the purposes set forth.

No. 38,137.—LEVI L. HILL, of New York, N. Y., assignor to WYMAN R. BARRETT, of the same place.—*Improvement in Producing Light and Heat, and applying the same*.—Patent dated April 7, 1863.—The invention consists in the explosion under pressure of a combination of a hydro-carbon, atmospheric air, and steam for mechanical and chemical purposes. Also in placing a cap of perforated platina or platina sponge over a burner supplied with a mixture of hydro-carbon and air, with or without steam.

Claim.—First, the combination of the vapors of a hydro-carbon, atmospheric air, and steam, or the vapor of water, under pressure, substantially as described, for producing by ignition an intensely heated jet of flame for generating steam, and for metallurgic and other similar purposes.

Second, the use of a platinum cap or chimney constructed and operating as described in combination with a jet of the mixed vapors of a hydro-carbon and air, with or without steam or the vapor of water, for the production of light.

No. 38,138.—THOMAS D. BOND, of Howard county, Md.—*Improvement in Apparatus for preventing Obstructions in Water-Pipes*.—Patent dated April 7, 1863.—The invention consists of an enlarged chamber in the pipe, which may be isolated by means of a valve in the pipe at each end, and which is provided with a strainer and exit port, so as to arrest and discharge fish, eels, or foreign matter which may have entered the water main.

Claim.—The combination with a water-pipe of the trap E, the strainer B, the port A, and the adjustable valves F and G, or the equivalents thereof, substantially as described.

No. 38,139.—J. L. ALBERGER, of Buffalo, N. Y.—*Improvement in Metallic Hoops*.—Patent dated April 14, 1863.—Metallic hoops are corrugated or creased in the line of their length, and when applied in the usual manner to casks, barrels, or other vessels, protect the wood of the latter from wear and injury by preventing its contact with the ground in rolling.

Claim.—A hoop for barrels, casks, tierces, or other vessels made of staves, having one or more corrugations or creases in it, for the purpose herein described.

No. 38,140.—CHARLES ATWOOD, of Durham, England.—*Improvement in the Manufacture of Steel*.—Patent issued April 14, 1863.—Patented in England May 15, 1862.—This process consists in melting together in one mass certain proportions of non-malleable metal of certain quality with certain proportions of malleable iron—the proportions varying with the quality in respect to the amount of carbon.

Claim.—The production or manufacture of steel and iron of a steely quality, substantially as hereinbefore described and set forth.

No. 38,141.—J. A. AYRES, of Hartford, Conn.—*Improvement in Screws*.—Patent dated April 14, 1863.—The slip in the head is made of a dovetailed form, to afford a firmer hold for the screw-driver.

Claim.—A screw A, with a dovetailed slot *a*, as and for the purpose set forth.

No. 38,142.—JOSEPH W. BARTLETT, of New York, N. Y.—*Improved Provision Cooler*.—Patent dated April 14, 1863.—This improvement is designed to combine the provision-cooler or cold-air chamber with an ice-box and water chambers in an efficient and convenient arrangement founded upon the necessities of the case, and the natural currents generated under these conditions. Three cold-air chambers are super-imposed, one over the other, and surmounted by an ice-box and filter. They are also surrounded by a cylindrical casing (except the doorway) containing cold water—the product of the thawing of the ice.

Claim.—A cooler or refrigerator consisting of the provision chamber J J, air and water chamber S S, ice-box H, hollow tubes O O, when arranged substantially as and for the purposes specified.

No. 38,143.—ALEXANDER BERTIER, of Hannibal, Marion county, Missouri.—*Improvement in Station and Street Indicators for Railroad Cars*.—Patent dated April 14, 1863.—This invention consists in an endless band, having the names of stations or streets marked upon it and placed in sight within the car, to be rotated as each locality indicated is reached, in combination with a bell-hammer alarm to direct attention to it.

Claim.—The endless band with a star or pointed wheel attached to one of its rollers or the shaft thereof, and a projection at the side of the track or road to actuate said wheel, in combination with a bell, combined spring-hammer and stop, and the pins or rods *b*, the latter being attached to the roller aforesaid, and all arranged to operate substantially as and for the purpose herein set forth.

Also, the weight *I*, applied to one of the rollers of the endless band, when used in combination with the other parts of the band-moving mechanism, for the purpose specified.

No. 38,144.—JAMES F. BODTKER, of Madison, Wis.—*Mode of Coloring Photographs.*—Patent dated April 14, 1863.—The object of this invention is to prepare albumenized paper to receive dry colors, for which purpose, by this invention, collodion is flowed over it with the addition, if desired to increase its adhesive quality, of balsam of fir.

Claim.—The use of collodion as a medium for receiving dry colors on photographic pictures on albumenized grounds, substantially as herein described.

No. 38,145.—A. C. BROWN, of Sycamore, De Kalb county, Ill.—*Improvement in Churn Dashers.*—Patent dated April 14, 1863.—This dasher consists of two parts, the lower one of a section of a hollow cone with its base downwards, and the upper part of a cone and a segment of a sphere joined together at their bases, the point of the cone being over the orifice in the lower section of the dasher, and the two sections being firmly attached by standards; the cream, by the shape of the lower plunger, is dashed violently against the inverted cone and by it deflected against the sides of the churn.

Claim.—The churn dash, constructed and operating substantially as and for the purposes set forth.

No. 38,146.—CHARLES T. CHESTER, of New York, N. Y.—*Improved Carbon Plates for Galvanic Batteries.*—Patent dated April 14, 1863.—The invention consists in imbedding a gold or platinum connexion in the body of the carbon element for galvanic batteries.

Claim.—In combination with a carbon element of a galvanic battery, a gold or platinum connexion imbedded in the carbon during the process of manufacture of the carbon element, substantially as described.

No. 38,147.—CHARLES CHINNOCK, of Brooklyn, N. Y.—*Improved Cork-Drawer.*—Patent dated April 14, 1863.—Upon the central stem of the corkscrew are two cams or screws of equal pitch, and one fitting the recess of the other, so as to form a cylindrical casing; upon the top of the most elevated one are ratched teeth, into which meshes a similarly furnished disk on the lower side of the handle. The rotation of the whole appliance will drive the screw into the cork, but when the bottle cover comes in contact with the cork the rotation of the handle will cause one thread to climb on the other, and raise the screw vertically.

Claim.—The combination of the ratchet cap *a*, the loose snail-like cam or screw *b*, and the corresponding cam or screw *c*, with the independent worm and pillar *d*, all operating together for the purpose set forth.

No. 38,148.—J. CHRISTMAN and WM. GILFILLAN, of Syracuse, N. Y.—*Improved Chuck for Lathes.*—Patent dated April 14, 1863.—The face plate of this chuck has radial dovetailed slots, in which work dogs with projections in front beyond the face of the plate, to grasp the work to be centred, and with projections behind, which enter eccentric slots in a disk, which is rotated inside of the back projecting flanged rim of the face wheel. The disk is rotated by a tangential screw operating on a worm cut on its grooved periphery, drawing the projecting studs at the back of the dogs in an eccentric groove, gradually approaching the centre.

Claim.—A chuck constructed, arranged and operated as described, that is to say, having the sliding pins or dogs *L* working in the radial dovetail grooves in the outer casement wheel, in combination with projections *O* working in the eccentric grooves in the face of the inner wheel or disk *J*, when said wheel or disk *J* is operated by means of the tangential screw *H*, the several parts being constructed, arranged, and operated in the manner described, for the purpose specified.

No. 38,149.—GEORGE F. J. COLBURN, of Newark, N. J.—*Improvement in Lamps.*—Patent dated April 14, 1863.—The reservoir is constructed so as to supply two or more burners simultaneously by the introduction of oil at an opening located between them.

Claim.—The reservoir *A* having the arms or projections *a* and *b*, so formed and combined with it as to support and supply with oil more than one burner, simultaneously as specified.

Also, the application of the cap between the burners for the object specified.

No. 38,150.—GEORGE F. J. COLBURN, of Newark, N. J.—*Improvement in Lamp Chimneys.*—Patent dated April 14, 1863.—The improvement consists in hinging a metallic tube over the globe of a lamp, so that it may be removed at pleasure by being thrown back; being hinged to the collar of the lamp by means of a high projecting post and a leaf or rod attached to the base of the tube or chimney.

Claim.—The method of connecting a tube with a lamp or gas-burner by means of a fixture

made and attached as described, so that it may be combined with or removed from a glass globe or other transparent device protecting the flame, substantially in the manner and for the purpose specified.

No. 38,151.—COWPER PHIPPS COLES, of Southsea, Hampshire, England.—*Improved Masts for Navigable Vessels*.—Patent dated April 14, 1863.—Patented in England April 10, 1852.—The invention consists in constructing masts of a central and two side tubes of iron or steel. The tubes pass through and are keyed to the decks, the central tube being carried in a direct line perpendicular to the transverse axis of the ship while the two side tubes are stepped in the hold in positions equidistant from the foot of the central tube, and are from thence carried up converging to a point above the deck, where they unite with the central tube.

Claim.—The construction of masts for vessels of tubes of steel or iron, in the manner and for the purposes substantially as set forth herein.

No. 38,152.—D. M. COOK, of Mansfield, Richland county, Ohio.—*Improvement in Evaporating Pans for Sugar Juices*.—Patent dated April 14, 1863.—This heating arrangement of the pan consists of a zigzag coil of steam pipes traversing the zigzag channels formed by the scum-arresting partitions of the circulating channel. The metallic pan has partitions from alternate sides extending part of the distance across the width of the pan, and the coils of steam pipes follow this course, the pipes being suspended above the metallic bottom from the partitions. The metallic pan is set in a wooden tray.

Claim.—First, the arrangement of a zigzag steam coil, constructed substantially as described, within the ledges of an evaporator pan which allows the juice to flow continuously in an indirect course, arrests the impurities and also keeps the juice comparatively cool outside of the steam coil, substantially as and for the purposes described.

Second, the combination of the steam coil, metal bottom, partitions, wooden ends and wooden bottom, in the manner and for the purpose described.

Third, the manner of suspending the coil.

No. 38,153.—GEORGE COWING, of Seneca Falls, Seneca county, N. Y.—*Improvement in Cylinder Polisher*.—Patent dated April 14, 1863.—It consists of a shank with arms and springs on the end of them, which carry semi-cylindrical polishing blocks. These springs are so expanded as to bring the blocks in contact with opposite sides of the cylinder bore.

Claim.—A cylinder polisher composed of the stem D, springs A A, and rubbers B, constructed substantially as set forth.

No. 38,154.—RICHARD T. CRANE, of Chicago, Ill.—*Improvement in Steam Radiators*.—Patent dated April 14, 1863.—The hollow base of this radiator is constructed with two or more compartments connected by U-shaped pipes which rise vertically and bridge the open space between the chambers forming the base; an opening in the partition between the chambers affords the means of egress for condensed water, and a stop-cock allows the discharge of air while the radiator is being charged with steam.

Claim.—First, constructing the base A of a steam radiator of two or more chambers and connecting the said chambers by the vertical U-shaped pipes B, when arranged and operating substantially as and for the purposes delineated and set forth.

Second, the opening C between the compartments of the base of the steam radiator for the purposes herein described and set forth.

Third, the opening c or its equivalent, for the purposes shown and specified herein.

No. 38,155.—H. M. CREAMER, of Brooklyn, N. Y.—*Improved Holding Frame for Corkscrews*.—Patent dated April 14, 1863.—This apparatus consists of a tubular cap of adjustable diameter to fit over the neck of a bottle, and a plunger adjustable vertically, through which the corkscrew descends to be driven into the cork. When the latter is withdrawn, the cork is drawn against points on the lower edge of the plunger which hold the cork while the corkscrew is removed.

Claim.—A corkscrew holder having the capacity, substantially as described, of being varied in width to suit different sized bottles, substantially as specified.

Also, a holder having the capacity, substantially as herein described, of being varied in length to suit various lengths of corkscrews, as set forth.

Also, the mode, substantially as specified, of holding the cork when withdrawn, while being freed from the corkscrew, consisting in the use of a series of points arranged and employed in combination with the holder, substantially as described.

No. 38,156.—BENJAMIN A. EARL, of Philadelphia, Pa.—*Improved Composition for Lubricating Wool*.—Patent dated April 14, 1863.—This consists of a solution of borax, say three and a half ounces to the gallon of water, to be mixed with an equal quantity of oil for washed wool, or with borax water for wool having the natural animal oil contained in it.

Claim.—The use of borax water for purposes of lubrication in the manufacture of wool, as above specified.

No. 38,157.—E. ELLIOTT, of Petaluma, Sonoma county, Cal.—*Improvement in Pumps*.—Patent dated April 14, 1863.—The induction and eduction tubes are made of wooden piping

and connect with the side of the pump cylinder which is secured thereto. The plunger spans the cylinder by a yoke, and is attached to the piston rod, which lifts a column of water and discharges it into the eduction pipe above, the chamber being filled again through the induction opening as the piston descends.

Claim.—The forming of the induction and eduction tubes A B, of a series of wooden pieces *a*, bored longitudinally and connected together, substantially as shown, in combination with the pump cylinder D, attached to one of said pieces *a*, and communicating with the tubes A B, as shown and provided with the piston F, all arranged to operate as described, the above parts being used with or without the air vessel C.

No. 38,158.—GEORGE C. FERRIS, of Sharon, Walworth county, Wis.—*Improvement in Device for Operating Churns.*—Patent dated April 14, 1863.—The invention consists in operating the plunger of a vertical churn by attaching it to a crank pin on a disk, revolved by a winch, by which it receives a compound lateral and vertical motion.

Claim.—The combination and arrangement of the dasher handle *e*, the lever E, the wheel B, the hole *o*, and the support and guide D, constructed and operating substantially as and for the purposes set forth and described.

No. 38,159.—BENJAMIN F. GOSSIN, of Cincinnati, Ohio.—*Improvement in Railroad Chairs.*—Patent dated April 14, 1863.—The rail is set upon a longitudinal sill plate and supported on each side by braces which underlie the upper flange, and passing round the edge of the sill are hooked under it. The parts are secured together by transverse bolts which pass through the braces and rail, and below by bolts passing through the braces and under the rail.

Claim.—First, the adaptation of the base plate C, side plates B, bolts *b' b'*, and rails A A, for use together in such manner that the base plate C is supported and confined against lateral, longitudinal, and vertical movement, in the manner substantially as described.

Second, the combination of the side plates B *b b* through bolts *b' b' c c* and plate C, with the rails A A, in the manner substantially as described.

Third, the side plates B *b b*, constructed as described, for the purpose set forth.

Fourth, the arrangement at the ends of the plate C of the key bolts *b' b'*, in the manner and for the purpose described.

Fifth, preventing lateral play of the base plate C by means of the jaws *b b*, which underhang the plate C, in the manner described.

No. 38,160.—SOLOMAN S. GRAY, of Boston, Mass.—*Improvement in Paper Shirt Collars.*—Patent dated April 14, 1863.—The collar is cut out of a flat strip of paper with suitable dies, and the upper part then pressed or rolled out, so as to give it the required flaring shape.

Claim.—As a new article of manufacture, a paper shirt collar struck up or pressed from a flat piece into any desirable form, substantially as described and for the objects specified.

No. 38,161.—JACOB HAIGE, of Shiloh, St. Clair county, Ill.—*Improvement in Gang Plough.*—Patent dated April 14, 1863.—The invention consists in arrangements for adjusting the points of draught so as to throw the plough in or out of land, which is accomplished by the mode of attachment of the pole to the frame beneath which the ploughs are suspended. In the forward transverse beam of the frame are holes corresponding with one in the pole, so as to give it a slightly angular position relatively to the frame and vary the line of draught of the ploughs, which are attached by draught rods to the vertical rod which supports the front end of the plough beam.

Claim.—First, the combination and arrangement of the pole G, axle E, vertical rod H', and draught rod J, substantially as shown, to admit of the lateral adjustment of the draught relatively with a gang plough, as set forth.

Second, the particular manner of attaching the pole G to the axle E, to wit, by means of the socket *b* fitted on the axle E, and arranged in such a manner as to receive the pole G, and having a screw *e* passing vertically through it, and through the oblong slots *f g* in the axle and pole, whereby the pole G is firmly secured to the axle E, and the former permitted to be readily adjusted when desired.

No. 38,162.—HIRAM W. HAYDEN, of Waterbury, Conn.—*Improvement in Lamps.*—Patent dated April 14, 1863.—In this lamp a round wick is used with a deflector so constructed as to spread the flame into a flat sheet within the chimney, extending the slot down for draught below the space occupied by the flame. The air is admitted by orifices in the floor of the burner into a distributing chamber, from which it passes to the flame.

Claim.—The circular wick and tube *c*, in combination with the deflector *h*, slotted as specified, and with the glass chimney *g*, having a draught space between the base of said chimney and the deflector, for the purposes and as specified.

Also, the perforated air-distributor *e*, in combination with the said circular wick *c*, slotted deflector *h*, and glass chimney *g*, for the purpose of regulating the action of the air, as set forth.

No. 38,163.—HIRAM W. HAYDEN, of Waterbury, Conn.—*Improved Reflector for Lamps.*—Patent dated April 14, 1863.—A spring ring is placed upon the chimney of the lamp, and

from this a pivoted reflector is suspended, which surrounds the chimney, and may be vibrated to an inclined position if desired.

Claim.—A reflector or shade surrounding the lamp chimney, in combination with the spring ring and hinges, as set forth, so as to allow of the inclination of said shade or reflector, as specified.

No. 38,164.—JAMES HILL, of Providence, R. I.—*Improved Tagged Braid for Shoestrings.*—Patent dated April 14, 1863.—The braid is made with double tags at suitable distances in its length, which are to be severed in the middle of the tags to make shoestrings.

Claim.—The described improved manufacture of double-tagged braid, capable of being made into tagged shoestrings by severing each double-tag blank at its middle, as specified.

No. 38,165.—JONAS HINKLEY, of Norwalk, Ohio.—*Improvement in Friction Wheels for Driving Machinery.*—Patent dated April 14, 1863.—A driving wheel having a square groove in its periphery in which two wheels run, one being fast on its shaft, and the other loose, and with springs between them, by which they are caused to bind against the sides of the groove and be rotated by their impact against the driving wheel.

Claim.—The wheel A, having a grooved periphery *a*, in combination with the wheel B, formed of a fixed part *b* and a sliding part *b'*, provided, respectively, with the springs F F and screws G, and arranged to operate in connexion with the wheel A, as and for the purpose herein set forth.

No. 38,166.—JOSEPH HOUGH, of Buckingham, Bucks county, Pa.—*Improvement in Railroad Car Brakes.*—Patent dated April 14, 1863.—The object of this invention is to construct a brake to be operated simultaneously by the engineer or the brakeman; the devices are detailed at length in the claim.

Claim.—First, the manner of winding up the chain X, to operate the bars U, to wit, by having the shaft Y, fitted in swinging pendants Z, attached to the locomotive and provided with wheels A', which are brought in contact with the treads of the wheels B', or with the axle thereof, by any suitable mechanism under the hand of the engineer or an assistant.

Second, the bars U, provided with a spiral spring V, when arranged in connexion with the chains W W and buffer-head bars P, to operate substantially as and for the purpose herein set forth.

Third, the sliding bar M, in connexion with the arm L, shaft K, provided with the arms J J and the chains I, connected to the arms J J and the rods H' H' of the brake mechanism, arranged substantially as and for the purpose herein set forth.

Fourth, the arrangement of the chains W W, fixed pulleys S, and the pulleys R on the buffer-head bars P, and the pivoted bars Q', to operate as shown, and keeping the chains W W at a proper state of tension during the movement of the bars P, as specified.

Fifth, the combination of the buffer-head bars P, bars U, chains W W, pulleys R S, slide bars M, arm L, shaft K, with arms J J, attached chains I I, and rods H' H', the latter being connected with the brake mechanism, and all arranged to operate as and for the same purpose herein set forth.

No. 38,167.—HENRY HUNGERFORD, of New York, N. Y.—*Improved Apparatus for Stirring and Mixing Soaps, Colors, &c.*—Patent dated April 14, 1863.—The vessel itself is of a semi-cylindrical or analogous form, and has a shaft with obliquely set radial arms extending from it by which the contents of the vessel are stirred. An upward extension of the walls provides against loss by foaming or splashing, and a sliding valve and valve seat at the bottom admit of the convenient discharge of the contents.

Claim.—The form and construction of the vessel A for mixing soaps, colors, and substances made up of different ingredients, substantially as and for the purposes set forth.

Also, the arrangement, substantially as described, of the arms C C', &c., on the shaft B, or their equivalent, so as to give a lifting or upward, and at the same time a lateral motion to the article being mixed, substantially as and for the purposes set forth.

Also, the combination of the shaft B, with its arm C, or their equivalent, with the mixing vessel A, or with a mixing vessel of other shape, for the purposes set forth.

Also, the application of the valve D, in combination with a mixing kettle A, substantially as and for the purposes set forth.

No. 38,168.—J. MORRISON HUNTER, of New York, N. Y.—*Improved Device for Inserting the Gores of Shoes.*—Patent dated April 14, 1863.—The gore of elastic material and the edges of the boot to which it is to be attached are clamped together by riveted eyelets, or otherwise, between metallic plates, which are hinged at the lower end of the gore so as to open for the insertion of the foot into the boot.

Claim.—Affixing the elastic gore by means of a clamp of metal, or equivalent device, whereby the said gore may be taken out and replaced, substantially as set forth.

No. 38,169.—FRANKLIN LA REW, of Hamilton, Ohio.—*Improvement in Hog Cholera Medicines.*—Patent dated April 14, 1863.—This medicine consists of—

Spanish brown, half pound; nitre, half pound; alum, half pound; copperas, half pound; salt, two pounds; fish brine, half gallon; hickory ashes, three pints; red peppers, one dozen

Pods; charcoal, two pounds; polkroot, one pound; sulphur, one pound; properly compounded and boiled in three gallons of water, and afterwards mixed with forty gallons of soapsuds.

Claim.—The combined use of the above-named ingredients, when prepared and used in the manner and for the purpose specified.

No. 38,170.—CONRAD B. LASHER, of New York, N. Y.—*Improvement in Lamps.*—Patent dated April 14, 1863.—The wick tube extends down into the reservoir, being gradually enlarged so as to hold the folds of the wick, and is supplied with oil through a small hole in the bottom, which supply is limited by a pointed plug which acts as a valve to regulate the passage of the oil to the wick case.

Claim.—First, the wick case *g* extending from the wick tube and gradually supplied with oil or fluid from the reservoir through a small hole 2, or its equivalent, as set forth and for the purposes specified.

Second, the cap *d* attached directly to the surface of the reservoir itself in combination with the vent 1, for the purposes set forth.

Third, the screw rod *k* and hole 3, in combination with the wick case *g* for regulating the supply of oil to said case, as set forth.

No. 38,171.—ALFRED LEIGH, of Clinton Station, Hunterdon county, N. J.—*Improvement in Cultivators.*—Patent dated April 14, 1863.—This machine consists of a frame on four wheels, from the rear of which depend two shares for furrowing out corn ground, with hinged cultivator teeth in the intervals and an arm extending out on the side of the machine to mark out the distance for the next row.

Claim.—The arrangement of the frame *A* with wheels *B B'*, adjusting levers *C*, furrowing shares *E*, hinged cultivator teeth *F*, and swivel bar *G*, with marker *H*, all constructed and operating in the manner and for the purpose herein shown and described.

No. 38,172.—HENRY LUMLEY, of Chancery lane, London, Eng.—*Improved Rudder.*—Patent dated April 14, 1863.—The rudder is divided vertically, and the parts (the body and the tail) hinged together. They are likewise so connected by chains attached to the tail and the stern post, and running through holes in the body, that the motion of the body causes a still further deflection of the tail in the same direction, and presents a surface to the water which is more directly transverse to the direction of the boat than the oblique line of the unjointed rudder.

Claim.—The attachment of the tail *B* to the stern-post *C*, by means of chains *D1 D2*, or equivalent fastenings, which pass obliquely through the body *A*, the several parts being constructed and operating substantially in the manner and for the purpose herein shown and described.

No. 38,173.—CHARLES H. MARVIN, of New York, N. Y.—*Improvement in Skates.*—Patent dated April 14, 1863.—The heel of the skate has a screw which projects up into a nut in the heel of the boot into which it is inserted by the rotation of the screw head within a slot in the runner, and projects beyond the sides of the latter so as to be worked by a wrench.

Claim.—Having the heel part of the skate provided with a rotating screw, the point and thread of which project above the surface of the skate foot-piece and enter a nut in the boot-heel, while the head of said screw is placed below the foot-piece and projects beyond the sides of the runner, as herein shown and described; so that by turning the head of said screw the skate may be quickly fastened to or removed from the foot, all as set forth.

No. 38,174.—JAMES MORRISON, jr., of Troy, N. Y.—*Improvement in Stoves.*—Patent dated April 14, 1863.—The improvements consist: First, in a plate extending down from the front end of the stove between which and the latter an upward stream of air from the outside is admitted, passing through a hole in the front and down between it and the fire chamber through the oven and eventually into the back flue. Second, in projections from the lower oven plate which extend into the lower flues to gather and retain the heat of the passing air; and, third, in placing chambers in the place of the usual reverting flue plates of the back and bottom, so as to retain the heat.

Claim.—Supplying the stove with a continued current of hot air by means of the cold-air chamber *u* outside of the oven plate *y*, with openings *o* in the bottom thereof, and the hot-air chamber *e* between the said cold air chamber and the fire chamber *a*, substantially as herein described and set forth.

Also, the downward projection *s*, in combination with the bottom oven plate *w*, substantially as and for the purpose herein described and set forth.

Also, the combination of the hollow walls or tubes *m m* and the vertical hollow walls or tubes *z z* with the oven *f*, substantially as and for the purpose herein described and set forth.

No. 38,175.—MARCUS P. NORTON, of Troy, N. Y.—*Improvement in Post Office Stamps.*—Patent dated April 14, 1863.—This cancelling stamp has two devices on the face, made of suitable material, one to obliterate the postage stamp, and the other to impress the post-mark upon the letter.

Claim.—First, the cancelling device C, with wood, cork, or rubber type or blotter G therein, or any device substantially the same, so as to cancel the postage stamps with indelible ink, substantially as herein described and set forth.

Second, the cancelling device C, with wood, cork, or similar material forming the type or blotter G therein, in combination with the cross-piece B and with the post-marking device D, substantially as herein described and set forth.

No. 38,176.—ELIAS NOLT, of Earl Township, Lancaster county, Penn.—*Improvement in Combined Lever and Crank Motion.*—Patent dated April 14, 1863.—A crank rotated by a wheel is caused to vibrate a rocking arm, to whose arms are attached wire which are supported at intervals by vibrating links suspended from posts, and are eventually connected to another vibrating arm which works the plunger of a pump.

Claim.—The combined arrangement of the vibrating arms D N, connected by the wires L1 L2, supported in vibrating links M1 M2, substantially in the manner set forth, in connexion with the arms C F, (on arm or beam D,) for working the pump and other appliances, at one and the same time, as herein specified, for the purposes mentioned.

No. 38,177.—CHARLES L. OSBORN, of Brooklyn, N. Y.—*Improved Bird Cage.*—Patent dated April 14, 1863.—This cage is constructed with a base containing a pan, and the upper part has a wire floor and tubular uprights with horizontal wires fastened thereto. The door is made to match the frame-work.

Claim.—First, the door P, constructed and operating substantially as set forth.

Second, the combination in a cage of base A, portable pan L, wire bottom K, and tubular frames B and C, &c., or their equivalents, constructed and arranged substantially as specified.

No. 38,178.—JAMES H. OSGOOD, jr., of Boston, Mass.—*Improvement in Car Coupling.*—Patent dated April 14, 1863.—The invention consists in an annular link with a bolt hole in its projecting socket, and a prong extending upwardly and downwardly, respectively, on the adjacent links to be shackled, so that as the coupling heads of the cars come in collision the prong of one link slides automatically over the other link, and falling becomes interlocked therewith, and becomes detached when one car tips to a certain angle, in which case the prongs are turned so as to free them from the links.

Claim.—The link C, provided with the prong d, and hole e, constructed and operating substantially as described.

No. 38,179.—JESSE REED, of Marshfield, Mass.—*Improvement in Threshing Machine.*—Patent dated April 14, 1863.—The thresher is a four-armed revolving shaft, and the grain is fed in at a side opening, so that it is beaten out of the straw while supported upon a yielding leather which forms the extension of the feeding board.

Claim.—The combination of the yielding lip E, with the revolving beater B, and the feeding board D, or its equivalent: the arrangement of the revolving beater B, or the driving shaft thereof, the feeding board D, and its opening i, being as and for the purpose substantially as described.

No. 38,180.—TIMOTHY ROSE, of Cortlandville, Cortland county, N. Y.—*Improved Scroll for Water Wheels.*—Patent dated April 14, 1863.—The scroll has a movable inner side, by which its capacity is limited in sectional area, and gates by which its length is diminished to make a more effective use of a diminished supply of water.

Claim.—The movable gauge piece or false side D to the scroll, in combination with one or more trap or stop gates C, as above described and for the purposes set forth.

No. 38,181.—JACOB RUTH, of Philadelphia, Pa.—*Improvement in City Railroad Cars.*—Patent dated April 14, 1863.—The invention refers to devices for clearing the track of the wheels of a city railroad car and for operating the brakes, and consists of shields or guards secured to a frame on the axles, independent of the car body, and descending nearly to the level of the track. The brakes consist of bevelled shields of a shape to fit the wheel, and are operated by levers to bring all the rubbers to work simultaneously.

Claim.—First, shields or guards of appropriate form, arranged adjacent to the wheels of city railroad cars, and secured to a frame resting on and supported by the axles, and independent, as regards vertical position, of the frame which supports the body of the car, substantially as set forth for the purpose specified.

Second, the rocking frames N N, hung to the within described inner or independent frame, furnished with guards h h, and bevelled shields M M, the whole being arranged and operating substantially as and for the purpose herein set forth.

Third, the combination of rocking frames N, sleeve W, with its arms n n n n and p p, and springs X X, or their equivalents.

Fourth, the brake levers P, hung to the inner or independent frame, joined to each other and operated substantially as set forth.

No. 38,182.—JOSIAH J. SHERMAN, of Albany, N. Y.—*Improvement in Car and Truck Connexions.*—Patent dated April 14, 1863.—The under side of the car and the upper side of

the truck are provided with corresponding hemi-spherical recesses in which are balls, rounded blocks, or rubbers: and the sockets on the trucks which support the balls are likewise provided with annular springs with bearings on flanges around them.

Claim.—First, the employment or use of balls E, or rubbers F', interposed between the trucks and the car body in suitable boxes, when the said parts are constructed and combined in the manner herein specified, so as to permit free motion of the car body laterally in either direction, and afterwards restore it automatically to its normal position.

Second, the combination of the annular springs *g*, with the bearings *e f h i j*, or any of them, when arranged to operate in the manner and for the purposes herein specified.

No. 38,183.—GEORGE H. SMITH, of Des Moines, Iowa.—*Improvement in Combined Bag Holder and Elevator.*—Patent dated April 14, 1863.—The bag is suspended by hooks from a frame which holds it to be filled with grain, the bottom of the bag lying upon a platform; the latter is attached to a vertically sliding frame, which is raised by a winch and rope, so as to elevate the bag of grain to a convenient height for the person to receive it on his back to carry it off.

Claim.—The combination of the adjustable arms D, and hooks *g*, with the movable frame A, rising and falling platform C, rope *h*, windlass E, ratchet wheel *n*, and pawl *o*, all constructed and operating in the manner and for the purpose set forth.

No. 38,184.—SAMUEL J. SMITH, of New York, N. Y.—*Setting in Jewelry.*—Patent dated April 14, 1863.—This jewelry setting consists of two circular or polygonal open disks or plates which are fitted respectively with clamps and strips and fitted the one over the other and soldered in position, the projections serving by being turned over to secure the sets in their places.

Claim.—The setting composed of the two frames or plates A B, combined by means of the pieces *b b*, and spurs *d d*, the back frame A, being furnished with clamps *c c*, and the front one B, with projecting strips *e e*, or their equivalents, substantially as herein set forth.

No. 38,185.—ANDREW STEVELY, of Fond du Lac, Wis.—*Improvement in Automatic Grain Scales.*—Patent dated April 14, 1863.—The invention consists of a revolving cylindrical scale arranged below a hopper through which the grain passes into the scale, and so arranged on a pivoted yoke that on receiving a given weight the scale will revolve and discharge the grain. The eduction pipe through which the grain is received into the scale is closed simultaneously with the revolution of the latter until the bar on the scale strikes against the pin of the valve and again starts the flow of grain, which falls into the other side of the cylindrical scale, which is divided longitudinally by a partition.

Claim.—First the arrangement of the chutes E and F in the hopper, substantially as and for the purposes herein specified.

Second, the arrangement of the valve V, provided with the pin *d*, or its equivalent, and the bar *m*, when used in connexion with a revolving scale and constructed and operating substantially as and for the purposes delineated and set forth.

Third, the employment (for the purposes herein specified) of a revolving scale M, constructed and operating substantially as herein set forth and described.

No. 38,186.—GEORGE W. SWETT, of Troy, N. Y.—*Improved Furnace for Smelting Ores and for other Purposes.*—Patent dated April 14, 1863.—The object is to smelt the metal in close proximity to the combustible material, but so that their solid particles are separated, and also to provide a reservoir where a mass of metal may be kept in a molten state by the heat from the smelting portion of the furnace. The metal is laid upon an inclined hearth, where it is exposed to the blast of heat, and runs down into a basin, from whence it may be used for smaller castings or collected in a reservoir and exposed to the reverberatory fire for use when a large quantity of evenly-heated metal is required.

Claim.—The construction of a furnace combined of the parts described or their equivalents, in the manner and for the purposes above specified.

No. 38,187.—JAMES TANGYE, of Birmingham, England.—*Improvement in Hydraulic Lifting Jacks.*—Patent dated April 14, 1863.—This jack consists of two parts, the upper chamber containing the reservoir and pump and having a hollow cylindrical termination, and the lower part consisting of a foot and a ram which occupies the hollow cylinder, being ground therein. By the motion of the lever the fluid in the upper chamber is pumped into the cylinder, where it impinges on the head of the ram and causes the cylinder to rise. It is lowered by an extra depression of the lever, which opens a valve and restores it to its former place in the reservoir.

Claim.—First, the arrangement and combination of the parts of hydraulic lifting jacks hereinbefore described and illustrated in Figures 1, 2, and 3, of the accompanying drawing.

Second, the arrangement and combination of the parts of the pumps of hydraulic lifting jacks hereinbefore described and illustrated in Figures 1, 2, and 3, of the accompanying drawing.

Third, the arrangements and combinations of the parts of the pumps of hydraulic lifting

jacks by which the lowering of the said jacks is effected, as hereinbefore described and illustrated in Figures 2, 4, and 5, of the accompanying drawing.

No. 38,188.—W. B. TREADWELL, of Albany, N. Y.—*Improvement in Coal Scuttles*.—Patent dated April 14, 1863.—This coal scuttle has a shield occupying a part of the upper opening and narrowing the orifice to a spout, while the coal is further retained by a strap and rod.

Claim.—The convexo-concave shield B, in combination with the straps *a* and the rods *e*, operating in the manner herein set forth.

No. 38,189.—F. G. TUCKER and A. CRAWFORD, of Albany, N. Y.—*Improvement in Lanterns*.—Patent dated April 14, 1863.—The arrangements of this lamp are intended to facilitate the moving of the wick without detaching the lower cylinder, and by annular plates to so deflect the air which enters at the orifices as to prevent its direct forcible impingement on the flame. The claims give a detailed description of the devices.

Claim.—First, the cells *s s* with the shelf *m* in cylinder E, and the cells *t t* with the shelf *n* in the cylinder B, for the purposes set forth.

Second, the partition *p*, with the openings *y* in cylinder B, to shield the heat from the cap of the lantern.

Third, the cylinder D, with its orifice *k* and slot *v* arranged to slide within the cylinder E, so as to accommodate the shaft *k* of the wheel wick-trimmer, in combination with the cells, shelves, and partition aforesaid.

Fourth, the springs *e e* as arranged to secure the cylinder D and E to each other in combination with said cylinders and with the cells, shelves, and partition aforesaid.

Fifth, the combination of the whole lantern as represented and set forth, embracing the said cells, shelves, partition, cylinders, orifice, and slot and springs, as applied to any of the lamps and burners now in common use, the whole to be made as represented and for the purposes herein set forth.

No. 38,190.—JOHN TURNER, of Norwich, Conn., and ISAAC E. PALMER, of Montville, Conn.—*Improvement in Machinery for Making Covered Twist and Cord*.—Patent dated April 14, 1863.—Around a central revolving spindle are a set of planetary disks carrying bobbins, the threads from which pass into and up through their common spindle of rotation, and passing out at the end are covered with thread from bobbins on disks which rotate on the same spindle as the lower ones, but at a more rapid rate. The covered threads from this point pass through the central revolving spindle and are there twisted into a three-fold cord of covered threads.

Claim.—The combination, with the elongated spindles F and the bobbins H and their disks H', of the hollow spindles G, the bobbins I, and the bobbin disks I', the latter revolving independently of and at greater velocity than the disks H; all in the manner and for the purpose herein shown and described.

No. 38,191.—JESSE B. WHEELER, of Bolton, Worcester county, Mass.—*Improvement in Grain Dryers*.—Patent dated April 14, 1863.—The machine consists of a heated air chamber below, with an inclined board for the dust to fall upon and be discharged, and a chamber above with a perforated floor, on which the grain is stirred by a succession of moving arms traversing on endless belts which feed the grain along from the place where it enters from the hopper to the exit, where it falls upon an inclined screen to the desired point. The heated air is drawn up through the perforated floor and driven out of the machine by a revolving fan on the summit of the case.

Claim.—First, in arranging the walls for forming the dust space I, as above described, in combination with the guiding plates J, substantially as herein described, and for the purpose set forth.

Also, in combination with the hot-air chamber E, perforated bottom C, and the stirring and moving arms traversing over it, the exhaust fan D for drawing the heated air up through the grain and through the machine substantially as described.

Also, in combination with the hinged apron K overlying the cool-air chamber L, the raising and lowering rods *o o* and hinged valve *s*, so that said apron may be raised or adjusted without opening the chamber L, substantially as described.

Also, as a stirring and moving mechanism or device, the arms *h b*, hinged, made adjustable, and moved by endless chains, substantially as herein described and represented.

No. 38,192.—WILLIAM W. WILCOX, of Middletown, Middlesex county, Conn.—*Improved Clew Thimble*.—Patent dated April 14, 1863.—The middle thimble supports the clew line block, and the guards on the outer thimbles protect the lines which pass to the sails from chafing against the block in the swaying too and fro with the motion of the vessel and sail.

Claim.—The application to a clew thimble B of a guard *a*, constructed and operating in the manner and for the purposes substantially as shown and described.

No. 38,193.—LOUIS WINTERBAUER, of New York, N. Y.—*Improvement in Direct-acting Engines*.—Patent dated April 14, 1863.—The object is to admit a full head of steam to the

end of the piston as soon as it arrives at the end of its stroke, so as to enable the crank to pass the dead points more readily. A secondary cylinder is provided with a slide-valve to suddenly throw the main valve to the other side of the steam chest, and start the piston on its back motion immediately.

Claim.—First, so combining the secondary cylinder C, with the slide valve D, tappet *m*, and cam F, that by the motion of the secondary cylinder at the end of each stroke the tappet *m* is carried back to its central position ready to be acted upon by the cam F, substantially in the manner and for the purpose shown and described.

Second, the exhaust port *e* of the secondary cylinder in combination with the exhaust port *c* of the main cylinder, substantially as described, when so arranged that the secondary cylinder exhausts through the same port with the main cylinder.

No. 38,194.—CHARLES J. WOOLSON, of Cleveland, Ohio.—*Improvement in Grates.*—Patent dated April 14, 1863.—The invention consists of an air chamber receiving air from the space between the grate and the hearth, passing back of the fire and into the fire chamber in a heated state, and uniting with the smoke and gas to promote combustion.

Claim.—The construction and arrangement of the air chambers, sections A and B, with the opening C, beneath the grate G, the deflecting plate B', and opening or openings E, substantially as and for the purpose herein set forth.

No. 38,195.—WILLIAM BREITENSTEIN, of New York, N. Y., assignor to M. FISCHER & Co., of same place.—*Improvement in Looms.*—Patent dated April 14, 1863.—The invention consists in making the take-up movement depend upon the motion of the jacquard mechanism, and its advantage lies in the uniformity and certainty of the action at the proper time.

Claim.—Operating and controlling the operation of a divided take-up by jacquard mechanism, so that the action of the several sections of the take-up shall be determined thereby, for the purpose herein set forth.

No. 38,196.—ERNST G. CHORMANN, of Philadelphia, Pa., assignor to Himself and THOMAS COCHRANE, assignor to ERNST G. CHORMANN, of the same place.—*Stereoscopic Instrument.*—Patent dated April 14, 1863.—This instrument consists of an outer casing, an inner one, sliding out telescopically, and a frame capable of extension, contained within the latter; to the end of the frame are hinged two arms, each provided with a ring containing a lens. The stereoscopic picture is confined between the spring and the end of the box. When folded away the lenses are closed together within the frame, to which they are hinged, and that is passed into the casing B, and the latter into the casing A.

Claim.—First, the frame C, having lenses adjustable in the manner described, or any equivalent to the same, and the casing B, in combination with the box A, or its equivalent, the whole being constructed and arranged substantially as and for the purpose herein set forth.

Second, the arms E and E', with their rings and lenses, when hung to the frame C, and arranged for ready adjustment, and for folding together substantially as set forth for the purpose specified.

Third, the spring *a*, when combined with the box A, casing B, and frame C, as set forth.

No. 38,197.—ERNST G. CHORMANN, of Philadelphia, Pa., assignor to Himself and THOMAS COCHRANE, assignors to ERNST G. CHORMANN.—*Stereoscopic Instrument.*—Patent dated April 14, 1863.—This invention consists of an extension frame, carrying at the end hinged arms with lenses, so arranged as to be readily set to suit the requirements of the person using, and folding away compactly when done with.

Claim.—The frame B, with its elastic legs *d* and *d'*, or their equivalents, and arms E and E', carrying appropriate lenses, in combination with the case A, of any suitable material, the whole being constructed and arranged substantially as and for the purpose herein set forth.

No. 38,198.—EDWARD LEITENBERGER, of Reichstadt, kingdom of Bohemia, assignor to AUGUSTUS G. SCHELLER, of New York, N. Y.—*Mode of producing Designs on Textile Fabrics, &c.*—Patent dated April 14, 1863.—The invention consists in imparting a watered appearance to the fabric by means of a lateral motion more or less rapid during the operation of printing, which is accomplished by vibration of a roller over which the fabric passes to the printing and pressing roller, the motion of the vibrating roller being governed by means of cranks, pattern, or eccentric wheels, the even tension of the fabric being secured by the arrangement of two hinged angular levers in connexion with the let-off roller on which the unprinted fabric is wound, and a weighted roller rotating in connexion therewith.

Claim.—First, imparting to the material to be printed a lateral vibrating motion during the operation of printing, substantially as and for the purpose specified.

Second, the combination with the printing roller C and pressing roller B of the laterally vibrating roller I, constructed and operating substantially as and for the purpose shown and described.

Third, the arrangement of the angular levers G and weighted cylinder H, in combination with the gudgeons of the let-off roller F of a printing machine, constructed and operating substantially as and for the purpose set forth.

No. 38,199.—P. J. CLARK, of West Meriden, New Haven county, Conn., assignor to S. S. CLARK, of the same place.—*Improvement in Coal-Oil Lanterns*.—Patent dated April 14, 1863.—The lamp is set into the foot of the lantern, and has around it, within the outer cylindrical casing, a jacket, through which the air is admitted in a gradually decreasing space, so that at the orifice above the oil chamber it issues in a sheet of air which impinges with force upon the flame, and permits a draught chimney to be dispensed with.

Claim.—The peculiar construction and arrangement, herein shown and described, of the jacket H, in combination with the lamp E and burner G, so that while the lower part of the air-duct is open and free, the upper part or space *d* will be narrow, and thus compress the air into a thin sheet and cause it to shoot with increased velocity into the interior of the burner, all as set forth.

No. 38,200.—WILLIAM BULLOCK, of Pittsburg, Pa., assignor to Himself, CALVIN ADAMS, and GEORGE D. SELDEN, of the same place.—*Printing Machine*.—Patent dated April 14, 1863.—The complicated mechanism of this machine does not admit of a brief description.

Claim.—First, the feeding of the paper into the printing machine from a continuous roll or web, by means of a feed roller revolving in contact with the paper roll, which rests against it.

Second, hanging the shaft of the spool, or axis of the roll of paper, in bearings at one extremity of two arms, which are rigidly attached at their other extremity to a shaft which is left free to turn on its axis in a fixed bearing, whereby the roll of paper is kept in an accurately horizontal position, at right angles to the path of the paper through the machine.

Third, placing the bearings of the arms which carry the spool of paper below, but not directly under, the feed roller, so that, being slightly inclined toward the feed roller, the roll of paper will press with a portion only of its weight thereon, in order that the angle of inclination may be gradually increased by the diminution in size of the roll of paper as it is unwound from the spool, and thus, although its weight is continually decreasing, the relative degree of pressure upon the feed roller may be correspondingly increased, and thereby a uniform actual pressure be maintained.

Fourth, the use of a counterpoise, so connected with the shaft and arms which carry the spool of paper as that, by adjusting the counterpoise, the degree of pressure on the feed roller of the roll of paper can be so regulated as to cause the paper to unwind on to the feed roller, without the roll of paper on the spool becoming loosened, as it would do were the whole or too great a proportion of the weight of a large roll of paper allowed to press upon the feed roller.

Fifth, combining in one the feed roller and one of the cutting cylinders, substantially as hereinbefore described.

Sixth, the use of grippers, or other equivalent device, for seizing the sheets of paper on the feed roller, and thereby causing it to carry the sheets of paper directly to the first impression cylinder, substantially as described.

Seventh, transferring the sheets of paper from a feed roller, moving at a slower speed, to the impression cylinder, or that device which carries the sheets forward from the cutters to the type cylinder, moving at a higher speed, by means of a pair of grippers on the feed roller and on the impression cylinder, without the use of tapes or other similar device for the purpose, and thus leaving a space between the sheets of paper as they pass through the machine without checking or intermitting the feed.

Eighth, the use of a set of grippers on one of the cutting cylinders, which are opened and closed by a stationary cam, or other equivalent device, by means of which such cutting cylinder also performs the work of a "layer-on," seizing the end of the paper before it is severed from the web, and carrying it round to the point of contact of such cutting cylinder with the first impression cylinder, which latter takes the sheet as the cutting cylinder yields it up; the cutter on the male cutting cylinder severing the paper when a sheet of sufficient length has passed between the cutting cylinders.

Ninth, the employment of a yielding sheath, consisting of two strips, placed one on each side of a serrated cutter, for the purpose of holding the paper firmly against the edges of the slot in the female cutting cylinder, while the cutter is severing a sheet of paper from the web; and also for the purpose of pressing the loose ends of the web or uncut sheet as it passes between the cutting cylinder immediately after the sheet which had just been severed therefrom, towards the opposite cutting cylinder, until the grippers on the cutting cylinders seize hold of it, and thus preventing the paper from passing down out of the reach of the grippers.

Tenth, permitting the escape from the machine of any piece of paper which the grippers on the large cutting cylinder fail to take hold of, or of any part of a sheet which may be torn from the web, by leaving a free passage between the large cutting cylinder and the first impression cylinder, so that such scrap will fall away when severed from the web by the cutter, without being seized by the grippers on the first impression cylinder, or being carried any further through the machine, thus preventing the clogging of the machine, and removing a fruitful source of annoyance and delay in the operation and damage to the machine.

Eleventh, transferring the sheet of paper, after it is printed in white, immediately from the first to the second impression cylinders, by means of the grippers placed on the second impression cylinder, which seize the sheet of paper just as the grippers on the first impression cylinder release it, without the use of tapes, cylinders, or other mechanical devices not contained in the impression cylinder, for the purpose substantially as described.

Twelfth, the use of a scrap blanket or apron interposed between the cutting apparatus and the type cylinder and inking apparatus, to prevent any dust or scraps of paper from falling on the type or inking cylinders.

Thirteenth, the delivering apparatus, consisting of short fly-rods, having a rapid stroke in a small arc up and down, so as to strike the rear end of the printed sheets as they pass from the machine, in combination with the curved fingers for holding the rear end of the sheets during the up-stroke of the fly-rods and until their down-strokes, and of a roller to receive the stroke of the fly-rods and the pressure of the curved fingers, and by an intermitting rotation to pass the sheets forward when released by both fly-rods and curved fingers, or other equivalent device, by which the paper is arrested at its rear end on its passage from the machine, whereby a very rapid delivery of the sheets is effected.

Fourteenth, the use of a delivering table for the reception of the printed sheets, beneath and in the rear of the delivering apparatus, which table remains stationary during the delivery of the printed sheets, until a certain number, say fifty or one hundred, have been deposited upon it, when it suddenly moves an inch or two to one side, and is again stationary, until an equal number of sheets are delivered, when it moves back again; and so on, alternating from side to side, for the purpose of counting and separating the sheets into files of any required number, substantially in the manner hereinbefore described.

Fifteenth, communicating an alternating lateral movement to the small ink-distributing rollers on the face of the large ink-distributing cylinder by giving a simultaneous reciprocating motion to one end of their bearings, for the purpose of securing a more perfect and uniform distribution of the ink.

No. 38,201.—R. A. DOUGLAS, of Orange, Essex county, N. J., assignor to EDWARD ROBINSON, of New York, N. Y.—*Improvement in the Manufacture of Gun Barrels*.—Patent dated April 14, 1863.—The operation is as follows: Take a round bar of wrought or malleable iron, of two and a quarter inches diameter and eleven inches long, and drill a hole through the axis of the same of seven-eighths of an inch bore, then draw this tube out under the rolls to the length of a gun barrel.

Claim.—The method herein described of making gun barrels, by drawing the same from a cylinder of malleable iron previously drilled, substantially as herein set forth.

No. 38,202.—DAVID MANUEL, of Lancaster, Pa., assignor to Himself and JOHN M. KELLY, of same place.—*Improved Bedstead*.—Patent dated April 14, 1863.—The improvements consist in the spring-slat bottom and the rail fastening. The rails are connected by two transverse sills whose ends set in sockets in the rails; upon the sills are bearings which are supported upon a conical coil of wire, and likewise by bent springs of double-hooked form, (as represented,) which fasten at their ends into the sills, their loop being passed through the bearing piece; upon the latter are placed the slats which support the mattress. The rail-fastening joint consists of a tongue with a receding face on the rail, and a corresponding slot in the fastening on the post, which, by being driven down, draws the end of the rail firmly against the post.

Claim.—First, the conically-coiled spring D, for the support of the bearing E, with its additional spring-rod and hinge G, shouldered for the loops or bracelets *f* on the slats F, in combination with the supporting and wedging cross-bar B and boxes C, all arranged and applied in the manner and for the purpose specified.

Second, the slotted and tongued bed-rail fasteners H K. constructed, operated and applied substantially in the manner specified.

No. 38,203.—JAMES E. TERRY, of Philadelphia, Pa., assignor to the Russell and Erwin Manufacturing Co., New York, N. Y.—*Improved Strike for Door Locks*.—Patent dated April 14, 1863.—This strike, on which the bolt impinges and rises to latch in the box, is made with an opening on each side and a projection between, and an inclined plane below each latch opening so as to be applicable to either a right or a left hand lock, without being inverted or reversed.

Claim.—A strike provided with two latch openings *b b*, side by side, an inclined projection *f*, and a central partition plate *c*, all arranged substantially as and for the purpose herein set forth.

No. 38,204.—FRANK P. SLOCUM, of Brooklyn, N. Y., assignor to SAMUEL W. SLOCUM, of same place.—*Improvement in Revolving Fire-arms*.—Patent dated April 14, 1863.—This invention consists in constructing a number of independently moving chambers which are admitted in recesses in a revolving cylinder, and which are slipped forward against a stationary piston to retract the exploded capsule, and are loaded by placing the cartridge in the lateral recess of the cylinder and retracting the chamber upon it.

Claim.—First, the construction of a revolving fire-arm with independent, longitudinally movable chambers, in combination with openings in the sides of the cylinder of sufficient size to permit the lateral insertion of metallic cartridges, without removing the chambers entirely from the cylinder.

Second, the stationary piston, applied in combination with the revolving cylinder and its independently movable chambers, substantially as and for the purpose herein described.

No. 38,205.—WILLIAM WHEELER, of Morrisania, West Chester county, N. Y., assignor to CHARLES GOODYEAR, jr.—*Improved Shade Rack*.—Patent dated April 14, 1863.—The curtain cord by which the window shade is raised and lowered is passed around a roller in the rack which is made elastic so as to increase its traction thereon, and an elastic spring pressure brought upon the roller carriage to maintain the tension of the cord.

Claim.—First, the employment and use of an elastic or flexible roller in racks, substantially as herein set forth and described.

Second, the employment and use of an adjustable spring in racks, substantially as herein set forth and described.

No. 38,206.—CHARLES W. S. HEATON, of Belleville, St. Clair county, Ill.—*Improved Defensive Armor for Ships and other Batteries*.—Patent dated April 14, 1863.—The invention consists in covering the armor plating of a vessel with wood.

Claim.—The employment of wood, or its equivalent, when used in the manner and for the purpose substantially as described.

No. 38,207.—MAYHEW ADAMS, of Chilmark, Massachusetts.—*Improved Harpoon*.—Patent dated April 21, 1863.—This harpoon is constructed with a semi-revolving head having a spiral groove, which works over suitable pins on a segment of a screw upon the body of the harpoon.—The two parts are held in position by a wooden pin which breaks on entering the whale, and the harpoon turns at right angles, with the semi-revolving head remaining fixed and coupled by the strain upon it.

Claim.—The application to the harpoon of a semi-revolving head resting upon segments of screws, or angular pivots, causing the harpoon to turn infallibly at right angles with the semi-revolving head when fast to a whale and a strain set upon it, and there to remain fixed or coupled together.

No. 38,208.—SAMUEL ADAMS and JEREMIAH R. FOGG, of Portland, Maine.—*Improvement in Kerosene Lamps*.—Patent dated April 21, 1863.—The glass chimney is secured upon the perforated cone plate by means of clasps and a screw, in the customary manner. The cone plate, supporting a cone, is pivoted to an arm projecting from a cylindrical metallic band, which fits snugly in the cap, to which it is secured by clasps, taking into oblong openings in the band. When the lamp is to be trimmed, a spring, which holds the cone-plate, is drawn back, and the latter, with the chimney attached, moved around upon its pivot, thus leaving the wick exposed, without the necessity of manipulating either glass chimney or cone.

Claim.—The band D, in combination with the pivoted cone-plate *l* and cap C, substantially in the manner and for the purpose set forth.

No. 38,209.—ABRAHAM ARNOLD, of Heidelberg, York county, Pa.—*Improvement in Pumps*.—Patent dated April 21, 1863.—This invention is based upon a peculiar construction of the plungers or connecting rods in a double-acting force pump, the rods being worked by a double crank, and that belonging to the lower valve working through the upper valve.

Claim.—A double-acting force pump having the connecting rod A of the lower sucker to work through the upper sucker at F, when operated by the double crank, represented by Fig. 2 at C C, the whole as shown and described.

No. 38,210.—WILLIAM C. BAKER, of New York, N. Y.—*Improvement in Screens for Heaters*.—Patent dated April 21, 1863.—The object of the improvement is to make a screen to surround a coil of heating pipes in such a way as to produce a current of air from the bottom and out of the top by making the sides solid and openings above and below.

Claim.—The employment, in combination with the steam or hot-water pipes, of a screen which is constructed substantially in the manner described, for the purposes set forth.

No. 38,211.—WILLIAM C. BAKER, of New York, N. Y.—*Improvement in Steam Radiators*.—Patented April 21, 1863.—The object of the improvement is to convey the steam upwards to the coil by a pipe, which likewise serves to allow the condensed steam or water to trickle back, the return pipe being connected with the supply pipe at the bottom of the coil.

Claim.—Conveying the steam from the boiler to the coil, and the condensed steam from the coil to the boiler, through one pipe, as described, by combining said pipe with both ends of the coil, substantially as hereinbefore set forth.

No. 38,212.—WILLIAM C. BAKER, of New York, N. Y.—*Improved Low-water Detector*.—Issued April 21, 1863.—Antedated March 25, 1863.—This invention consists of a contrivance for indicating too great a pressure of steam or lowness of water, by a vertical pipe, so arranged as to have its open end below the low water level, and raised to such a height above that level that the weight of the column of water will be equal to the maximum pressure of steam desired; said pipe then recurving downwards and opening to the ash pit or otherwise, so as to discharge steam into the fire and thus indicate or remove the danger.

Claim.—The employment, in combination with a steam boiler and open pipe E, of a pipe

or opening to the ash pit or furnace, the whole arranged to operate substantially as and for the purposes set forth.

No. 38,213.—AUGUSTUS A. BENNETT, of Cincinnati, Ohio.—*Improved Pistol Holster*.—Patent dated April 21, 1863.—The invention consists in operating automatically the flap, which secures and covers the pistol by a spring.

Claim.—The holster A, closed automatically by the oblique flap B, and metallic spring D, so as to combine security with facility of use, in the manner set forth.

No. 38,214.—JOHN W. BLODGETT, of Three Rivers, St. Joseph county, Michigan.—*Improvement in Portable Fences*.—Patent dated April 21, 1863.—This improvement consists in the arrangement of lapping rails or boards, the upper pair resting in the angle formed by two inclined shears, which are set in a base or sill, the lower two boards being retained with a notch on the upper side of the sill and two others connected by a pivot.

Claim.—The combination and arrangement of the lapping rails, shear braces, notched sill and pivot hinge, in the manner and for the purpose described.

Second, the arrangement of the lapping rails of the panels, pivot hinge and shear braces, in the manner and for the purpose described.

No. 38,215.—WILLIAM F. BURDEN, of Troy, N. Y.—*Improvement in Governors*.—Patent issued April 21, 1863.—The nature of this invention consists in the interposition of adjustable frictional gear wheels between the crank shaft and the spindle of the governor for increasing or diminishing its speed, and thereby that of the engine.

Claim.—First, the employment of adjustable frictional gearing, when interposed between the crank shaft and governor spindle of an engine, essentially as and for the purposes herein set forth.

Second, the auxiliary device, so applied, in connexion with a governor, that the engine can be set to run at any desired speed, and yet be controlled by the same governor, substantially as described.

No. 38,216.—CHARLES H. BURTON, of Cleveland, Ohio.—*Improved Propeller Wheel*.—Patent dated April 21, 1863.—This invention consists in a certain angle of contour of the bucket and is described in the claim.

Claim.—So forming the face of the bucket that lines describing such face, as shown at *a b c d*, &c., incline forward of a right angle at about six degrees, as shown in Figs. 1 and 5, for the purpose of causing the displaced water to flow directly aft, substantially as and for the purpose specified.

No. 38,217.—DAVID COPE, of Liverpool, Lancashire, England.—*Improvement in the Manufacture of Drums, Kegs, Casks, &c.*—Patent dated April 21, 1863.—Patented in England October 8, 1860.—The metallic plate heads of the cask have their edges turned up in a flange at right angles, and are fitted to the interior of the cylinder with the edges of the flanged head and the edge of the chime flush and even; then over them an U-shaped hoop is slipped embracing both, and all are secured together by being dipped in molten metal.

Claim.—The binding hoop *c*, substantially formed and fitted in the manner herein described for the purpose set forth and shown in the accompanying sheet of drawings.

No. 38,218.—GEORGE F. DALLON, of Flatbush, Kings county, N. Y.—*Device for Carrying off Water from Musical Instruments*.—Patent dated April 21, 1863.—A perforation having been made in the tube of the musical instrument, a socket is fastened thereto containing an absorbent or filtering material which shall not interfere with the integrity of the walls, the inner surface occupying the place of the removed tubing.

Claim.—The application to musical instruments, such as mentioned, of any absorbing or filtering material capable of absorbing and retaining moisture, over, to, or upon any perforation or opening in the instrument, either as hereinbefore described, or in any other way which will produce the intended effect.

No. 38,219.—CYRUS C. DENNIS, of Auburn, Cayuga county, N. Y.—*Improvement in Rakes for Harvesters*.—Patent dated April 21, 1863.—The object of this invention is to give to the rake head the four motions necessary for its work, namely, forward, upward, backward, and downward, from the revolution of a pinion; on the post is hung by a swivelling pin a segment of a sphere to which the rake head is attached; the latter is also hinged to the swivelling pin, so that both may turn around with the swivelling pin, and also raise up or descend by the joint, as the case may be. On the rear portion of the segment of the sphere is a gear of irregular form somewhat flat on its longest sides, but abrupt at its ends, so as to raise and lower the rake quickly. These gears engage with the pinion, and close to the gears is a groove in which the pinion shaft runs, thereby acting as a guide to the pinion.

Claim.—First, the use of an irregular gear on the surface of a sphere or segment of a sphere for the purpose, in connexion with a pinion, of getting four rake motions, as herein described and represented.

Second, in combination with the irregular gear an irregular shaped groove conforming thereto, as a guide for the pinion, substantially as described.

Third, supporting the sphere or segment thereof, at its centre, by a swivelling and hinged connexion, in the manner and for the purpose substantially as set forth.

No. 38,220.—Dr. ALOYSE CHEVALIER AUER DE WELSBACH, of Vienna, Empire of Austria.—*Improvement in the Manufacture of Paper, &c., from the Husks of Indian Corn.*—Patent dated April 21, 1863.—Patented in Austria November 23, 1861.—The husks or leaves of maize are boiled in a solution of lime or soda till the fibre is detached from the soluble matter and precipitated; the fibre is then dried and carded, to be used for making fabrics or paper, and the soluble portion may be utilized for food.

Claim.—The process of obtaining and separating the textile material contained in the husks and leaves and stalks of maize or Indian corn, by exposing the same, together with a solution of lime and soda, or equivalent substances, to the action of hot or boiling water, and preparing the said textile material for use in the manner above described, or in any manner substantially the same as described.

No. 38,221.—CHARLES DOWNER, of Philadelphia, Pa.—*Improvement in Platforms of Weighing Frames.*—Patent dated April 21, 1863.—The platform of the scale is suspended from the steelyards, or weighing beam, and has a tilting table and retaining catch for discharging the contents.

Claim.—The platform composed of the frame H and tilting table I, when constructed, arranged for suspension to the graduated beam of a weighing frame, and operating substantially as and for the purpose herein set forth.

No. 38,222.—SAMUEL WARD FRANCIS, of New York, N. Y.—*Machine for Cancelling Postage and other Stamps.*—Patent dated April 21, 1863.—This hand-stamp is so constructed that, by a downward pressure on the handle, the cutting edges on its lower end are caused to rotate and cut out a portion of the stamp. A guard is arranged to prevent the rotation of the stamp, and the spring is adjusted to limit the depth of cut to the thickness of the material on which the stamp is printed.

Claim.—The method of cancelling adhesive stamps by means of a cutting edge, or series of cutting edges, so operated that, when applied to the stamps, one or more portions thereof shall be cut out and removed without injury to the material to which the stamps are attached, substantially as set forth.

Also, the combination and construction of a hand-instrument for cancelling stamps by cutting, as before referred to, so that by one downward pressure its cutters or scrapers shall be operated to remove a portion of the stamp without injury to the paper underneath, substantially as set forth.

Also, the combination with cutters, operated by a sliding handle of a studded guard and support, so arranged that the instrument is thereby caused firmly to grasp or to impinge upon the surface of the stamp to be cancelled, while the cutters are being operated; also to guard the cutters against undue pressure upon the paper, substantially as set forth.

Also, the combination with the cutters, of a hand-instrument for cancelling stamps, by cutting out of and removing from the stamp one or more portions thereof, of a spring so arranged as to bear the cutter upon the stamps with a pressure requisite to produce an incision in the paper of a depth not exceeding the thickness of stamps, substantially as set forth.

No. 38,223.—SOLOMON FREDERICK, of New York, N. Y.—*Improvement in Coal-Oil Burners.*—Patent dated April 21, 1863.—The invention consists of a double flaring cap which is placed on the end of a wick tube to prevent the extinguishment of the flame by lateral currents of air.

Claim.—As an improved article of manufacture, the top D, when made in the peculiar form and manner herein shown and described, and applied to the tube C, as set forth.

No. 38,224.—CHARLES W. GAGE, of Homer, N. Y.—*Improved Attachment of the Tow-Lines of Canal Boats.*—Patent dated April 21, 1863.—The tow-line is passed over a rod which is pivoted at its forward end and retained by a headed bolt at its rear; it is disconnected by withdrawing the bolt endwise, so that the draught on the line will vibrate the rod and cast off the line.

Claim.—The lever *d*, the rod C, the block *k*, and the spring *j*, the whole arranged in the manner and for the purpose substantially as herein described.

No. 38,225.—JAMES H. HILLS, of Burlington, Vt.—*Improved Car Coupling.*—Patent issued April 21, 1863; antedated March 24, 1862.—Each coupling head contains on its face an inclined plane for the end of the link to climb, and a depression to retain it; also, a pivoted tumbler which is vibrated by the advancing link in the act of coupling, the link being retained by the falling of the tumbler when the former has passed into the recess.

Claim.—The construction of a coupler with cavities or openings *a* and *b* in Fig. 2, and tumbler *c* in Figs. 1 and 3, combined with link *f* in Fig. 1, substantially in the manner and for the purpose above set forth.

No. 38,226.—JONAS HOLMES, of Clayville, Oneida county, N. Y.—*Improvement in Water Wheels*.—Patent dated April 21, 1863.—The buckets of this wheel have holes in the bottom, by which each communicates with the one below on the working side of the wheel, by which means a continuous sheet of water is intended to be obtained on that side of the wheel, and the buckets prevented from spilling their contents until they arrive at a point nearly under the shaft.

Claim.—The employment or use, in an overshot breast or any bucket water wheel of perforated bottoms *D* to the bucket, so arranged as to operate in the manner and for the purpose herein set forth.

No. 38,227.—WILLIAM HUGHES, of Rochester, N. Y.—*Improvement in Aprons for Stoves and Grates*.—Patent dated April 21, 1863.—The front of the furnace has holes covered by sliding doors; by raising the doors the holes in the latter are brought into coincidence with those in the furnace front, and afford an entrance for the poker.

Claim.—The combination of the slides *C C*, apron *A*, provided, respectively, with the holes *c c* and openings *a a*, which, when in coincidence, allow the entrance and perfect action of the poker, without the escape of dust, substantially as herein set forth.

No. 38,228.—R. C. JACKSON, of Cleveland, Ohio.—*Improved Mode of Driving Propeller Screws*.—Patent dated April 21, 1863.—The invention consists in the arrangement of the crank shaft and the outboard shaft in line with each other, and coupling them together by gearing with a geared countershaft above, which gives an increased speed to the outboard or screw shaft.

Claim.—First, placing the crank shaft that connects with the engine in line with the outboard shaft, as specified.

Second, the herein-described arrangement for coupling the outboard and inboard shafts together, for the purpose set forth.

Third, the arrangement of the compound gear wheels *E G* and *H I* and counter shaft *F*, for the objects herein specified.

No. 38,229.—JOB JOHNSON and JOSEPH BARBER BOLTON, of Brooklyn, N. Y.—*Improvement in Track-Clearers*.—Patent dated April 21, 1863.—The track-clearer, running close to the rail, is on the end of a downward inclined spring shaft, which allows it to ride over inequalities, such as the joints of the rails; it may be lifted vertically so as to render it inoperative, and to allow for the rocking of the bed of the car to which it is attached; an arm extending from the truck abuts upon the under side of the track-clearer shaft so as to raise it when that side of the car is depressed.

Claim.—First, a track-clearer fastened upon the end of a slide that is inclined backwards and upwards, and fitted with a spring, or its equivalent, substantially as specified, whereby the said track-clearer rides over and clears the ends of rails or other rigid parts with which it may come in contact, as set forth.

Second, the stocks *e* and boxes *h*, constructed as specified, in combination with the track-clearers *f* and sliding rods *g*, as set forth.

Third, the lever *m*, in combination with the track-clearers *f*, said lever being fitted and acting as and for the purposes specified.

Fourth, the rod *o* and socket *p*, in combination with the track-clearers *f f*, for the purposes and as specified.

No. 38,230.—C. D. LAKEY, of Loudonville, Ashland county, Ohio.—*Improvement in Trusses*.—Patent dated April 21, 1863.—The pad is of an oval shape, and its neck is connected to a stem which works in a pipe-box, the latter being connected to the end of the hoops. The end of the stem passes through two disks, one attached to the stem, and the other to the hoop, and a volute spring between the disks is attached to the latter at its respective ends, and the spring is wound up by revolving the pad. The spring is kept at its tension by a sliding catch which engages with holes in the disk nearest to it.

Claim.—First, the pad *A*, stem *B*, pipe *C*, and spring *I*, when arranged and combined as herein specified.

Second, the catch *J*, in combination with the disk *H*, when constructed, arranged, and operated substantially as and for the purposes set forth.

No. 38,231.—M. CAREY LEE, of Philadelphia, Pa.—*Device to Prevent Counterfeiting Bank Notes, &c.*—Patent dated April 21, 1863.—The improvements consist in the coloring of the paper in shades or designs; the simultaneous printing of the obligatory parts, as the number, denomination, seal, and signature all at one time, and of a permanent color, while the design may be printed in fugitive ink.

Claim.—First, printing or staining a ground design or incorporating a color in a graduated shade.

Second, printing simultaneously the signatures, numbering, and seals, by placing the stamps, blocks, &c., in one frame.

Third, printing the ornamental part of the note as distinguished from the ground tint in fugitive, and the obligatory and denominational part in permanent color; all as already described or in any other manner substantially the same.

No. 38,232.—JOHN M. LONG, of Hamilton, Ohio.—*Improvement in Harvesters.*—Patent issued April 21, 1863.—Antedated December 4, 1862.—The fore carriage to which the machine is attached has upon its axle central plates which admit of some lateral play upon the king bolt connexion, so as not to twist the draught rod in passing over uneven ground.

Claim.—Constructing the centre plates C and D with a central pivotal bearing, in combination with the vibratable centre bolt E and outer bearings *c c*, substantially as described and for the purpose specified.

No. 38,233.—JOHN M. LONG, of Hamilton, Ohio.—*Improvement in Crank-Wrists.*—Patent dated April 21, 1863.—The wrist is made of a ferrule and central bolt with a washer and nut. The ferrule is sunk into the crank, and the object is to make a firm attachment for the rod working thereon, and one which may be readily renewed.

Claim.—So making the wrist that the ferrule which covers the screw bolt or pin B shall be let into the face of crank A, and held in place by the screw bolt B, substantially as and for the purpose set forth.

No. 38,234.—ARTHUR MCCARTER, of Norristown, Pa.—*Improvement in Pumps.*—Patent dated April 21, 1863.—The cylinder of this double-acting pump is divided by a central transverse diaphragm into two chambers, having on each side of the partition two parts, each pair uniting at their junction with the chamber. Above the diaphragm is an eduction opening which communicates with each chamber by the more central of each of the pairs of ports. Above, in a chamber with five ports, is a sliding valve with an opening beneath by which it brings the eduction port of each chamber alternately in communication with the common eduction opening, and by its two ground or fitted-end faces alternately closes the eduction ports of either chamber which communicate with the discharge pipe.

Claim.—First, the combination of the three-faced valve, moved by the water, with the valve seat and the auxiliaries thereto, the whole constructed and operating substantially as and for the purpose described.

Second, the three-faced valve in combination with the five ports, substantially as described.

No. 38,235.—GEO. W. LUDLOW, of Elizabeth, Union county, N. J.—*Improvement in Gaiters.*—Patent dated April 21, 1863.—The back of the gaiter has a spring inserted between the folds of the stuff of which it is made, so as to preserve its shape.

Claim.—The combination of the spring B with the back of said gaiterette, substantially as and for the purposes set forth.

No. 38,236.—JOHN N. MCLEAN, of New Philadelphia, Ohio.—*Improved Window-Sash Supporter.*—Patent dated April 21, 1863.—This is a method of operating the eccentric which retains the sash by pressing it over against the opposite jamb. The manipulation is by means of the thumb-piece which pushes the slide in the groove and rotates the eccentric out of contact with the sash.

Claim.—The irregular groove *i*, slide *j*, and catch *m*, in combination with the face plate O, and its projections *n* and *p*, operating in the manner and for the purpose set forth and described.

No. 38,237.—HENRY MESSER, of Roxbury, Mass.—*Improvement in Hot-air Engines.*—Patent dated April 21, 1863.—Excess of speed of the engine causes the governor balls to operate a valve by which the compressed air is stored in a reservoir to be again let back to the assistance of the engine when an extra load shall have reduced the speed of the governor balls below their normal rate.

Claim.—The described new method of regulating a hot-air engine by means arranged and operating substantially as herein set forth.

No. 38,238.—FRANCIS MILLIKEN, of Boston, Mass.—*Improvement in Steam Cooking Apparatus.*—Patent dated April 21, 1863.—The improvement consists of a metallic dish containing a coiled metallic tube heated by steam, on which the food is laid. The coils are soldered together and have a basin-shaped form dishing towards a central cup to contain the gravy.

Claim.—The within-described apparatus for frying and broiling by means of steam, arranged and operating in the manner substantially as set forth.

No. 38,239.—LEWIS F. NOÉ, of New York, N. Y.—*Improvement in Culinary Steamers.*—Patent dated April 21, 1863.—In this improvement the sides and top of the vessel are attached together and placed over the flanged bottom, where it is secured by hooks, and at a suitable distance up the sides of the steamer is a flange which limits its descent into the vessel upon which it is used.

Claim.—A culinary steamer combining the attachment or junction of the top and bottom portions below the line of support upon the vessel on which it is to be used, with the projecting rim F, or its equivalent, substantially as and for the purpose set forth.

No. 38,240.—JAMES M. OSGOOD, of Chelsea, Suffolk county, Mass.—*Improved Holder for Hat Brushes.*—Patent dated April 21, 1863.—This appliance is intended for brushing the

crown of the hat, and consists of a ring or band adapted to the circumference of the hat and containing within it a brush supported by springs which are capable of lengthening or contracting to hold the brush in position as the outer band is adjusted in diameter to suit the varying sizes of hats.

Claim.—The combination of the band A and projections or holders *d g*, or their equivalents, for supporting and carrying a hat brush, as described.

Also, making the spring D adjustable so as to increase or diminish the distance between the holders *d g*, for the purpose described.

No. 38,241.—JOSHUA REBER, of Shoemakerville, Berks county, Pa.—*Improvement in Portable Fence.*—Patent dated April 21, 1863.—This fence is designed to be set up without posts or the necessity of interlocking; the panels consist of upright picket posts with horizontal boards and wires; to the upper wire a section of the same length is hinged by staples enclosing the wire, so that the two being spread at the bottom and the feet of the picket posts driven into the ground they may form a mutual support.

Claim.—The adjustable hinge wire C in connexion with the transverse grooves and staples in the pickets, when used for the purpose as herein described and set forth.

No. 38,242.—CHRISTIAN REIF, of Lewis township, Union county, Pa.—*Improvement in Clover-Hullers.*—Patent issued April 21, 1863.—Antedated January 30, 1863.—This transverse adjustable semi-cylinder is located across the machine in such a position as to catch the light seed and tailings, from whence they are carried out of the machine by the conveyer and elevated to be again operated upon.

Claim.—The adjustable cylinder C, with its conveyer A, adjustable wind gate G, and inclined board E, when arranged and combined as herein described.

No. 38,243.—A. L. ROBINSON, M. M. DONNELLY, and D. H. KRUM, of Cincinnati, Ohio.—*Improvement in Flasks for Founders.*—Patent issued April 21, 1863.—Antedated November 7, 1861.—The flask is supported upon a base, and at a suitable time after the pouring of the metal the fastenings of the core are withdrawn, and it is allowed to drop, while the casting with the cheek and cope remain supported upon the base.

Claim.—So supporting the core C that it may be released and allowed to fall from the interior of the casting at a suitable time after the metal has been poured, the casting meanwhile remaining supported by its rim resting upon the base A, substantially in the manner and for the purpose set forth.

No. 38,244.—JOSEPH B. RYDER, of Wapello, Iowa.—*Improvement in Corn Planters.*—Patent dated April 21, 1863.—The corn planter is supported on wheels, which are preceded by runners to make the furrow and seed tubes; the seed is dropped by moving the foot lever which works the slides in the bottom of the hopper as the slide rods are connected with the shaft vibrated. The seed falls upon a scatterer, so as to prevent the plants being crowded in the hill.

The cups project above the main surface of the slide, and parallel ridges are formed from the margins of the apertures, and the scrapers strike the outside of the holes before the centres, so as to prevent breaking the grain and to keep it rolling towards the centre of the hopper.

Claim.—First, the seed slide B, constructed and operating in the manner and for the purpose set forth.

Second, the cut-off I, constructed and operating in the manner and for the purpose set forth.

Third, the combination of the slide B and cut-off I, substantially in the manner and for the purpose set forth.

Fourth, the gravitating double delivery valve *m*, constructed and operating in the manner and for the purposes explained.

Fifth, the combination of the double scattering bar with the delivery valve *m*, substantially as and for the objects specified.

No. 38,245.—SAMUEL J. SEELY, of Brooklyn, N. Y.—*Improved Rubber Spring.*—Patent dated April 21, 1863.—Into each end of a rubber tube the shouldered shank of a metallic eyelet is inserted, and the rubber bound around the shank behind the shoulder so as to prevent the latter from being retracted.

Claim.—A spring composed of a piece of India-rubber tubing having eyes B, or their equivalents of metal, provided with shouldered shanks *a b* inserted into its ends and secured by seizing or bands *c*, substantially as herein specified.

No. 38,246.—CHARLES A. SHAW and JAMES R. CLARK, of Biddeford, Me.—*Improvement in Sewing Machine.*—Patent dated April 21, 1863.—The improvement is in that class of sewing machines which use a common sewing needle and make a running stitch, and consists of an arrangement of the motive and crimping wheels, which pucker the cloth, so that the straight motion of the needle passes it through the cloth from side to side; the wheels are placed on plates or bearings jointed near one end, and may be readily detached. By the motion of the crank the cloth is crimped and pressed on to the needle until the latter

is filled, when the crank is reversed to detach the needle from its holder, the cloth slipped on to the thread by hand, the needle readjusted, and proceed as before.

Claim.—First, the combination and arrangement of the wheels $m m m' m''$ and their shafts with the spring 3° and plates 4 5 5', which plates are connected at one end by a joint, or its equivalent, substantially in the manner and for the purpose set forth and specified.

Second, arranging and combining the wheels $m m m' m''$, wheels $f f'$, crank g , and spring 3° with each other and with the plates 4 5 5' in such a manner as to be taken out of or put into the body of the machine A all at one time, by means of the screws $n n$, or their equivalents, substantially in the manner and for the purpose set forth and specified.

No. 38,247.—J. J. SMITH, of New York, N. Y.—*Improvement in Steam Radiators.*—Patent dated April 21, 1863.—The ornamentation of the coil of steam pipes forming the radiator is the feature of this invention.

Claim.—As a new article of manufacture an ornamented coil radiator, substantially as hereinbefore set forth.

No. 38,248.—WILLIAM STARK, of Pittsburg, Pa.—*Improvement in Operating Rolls for Rolling Iron.*—Patent dated April 21, 1863.—The object of this improvement is to avoid the necessity of passing the plate back over the rollers to run it again through between them as they continuously revolve in the same direction; it is accomplished by a sudden reversal of their movements, by which it can be passed back under pressure. The device is clearly explained in the claim.

Claim.—The combination of the counter-shaft, gearing into the main shaft of the rolls at both ends, by means of a pair of cog-wheels at one end and a pair of wheels and an idler at the other end, with the crabs, for connecting one of the rolls with the shaft at either side, at pleasure; the half crabs on the roll at either end being operated together so as to connect the roll with the shaft at one end, and disconnect it from the shaft at the other end, simultaneously, substantially in the manner and for the purposes hereinbefore described.

No. 38,249.—ANSON P. STEPHENS, of Brooklyn, N. Y.—*Improvement in Lock for Fire-Arms.*—Patent dated April 21, 1863.—The main spring is pivoted to the lock-plate and the hammer at its upper end connected with the trigger.

At its lower forward projection the hammer has a detent which engages in the half and full cock notches in the trigger, the retraction of which, by releasing the detent, permits the hammer to fall.

Claim.—The elliptical spring f attached at i to the hammer and at e to the lock plate, and extending as an arm g to the trigger, as and for the purpose specified.

Also, the trigger h , formed with the half and full cock notches m and n , in combination with the arms $e e$, extending from the tumbler and carrying the detent r , for the purposes and as specified.

No. 38,250.—HERMAN STRATER, jr., of Roxbury, Mass.—*Improvement in Air Condensing Apparatus for Forcing Liquids.*—Patent dated April 21, 1863.—The invention consists of an apparatus for condensing air and retaining the same under pressure ready for use; the reservoir is supplied with water and air, and has a receptacle for containing the air when compressed and an arrangement of induction and eduction passages and valves for the reception and delivery of the water and air to their proper localities and at the suitable times. The details of the arrangements may be found in the claim.

Claim.—The combination with the alternate air and water reservoir, in which the air is compressed and displaced by water, of a two-way cock, so arranged in relation to a water and air supply pipe as to operate substantially in the manner as hereinbefore set forth.

Also, the combination with the alternate air and water reservoir, in which air at the pressure of the atmosphere is compressed and displaced by water, of an air receiver, the two being connected by pipes and valves in such manner that the compressed air cannot return to the said reservoir, substantially as set forth.

Also, the air and water supply pipe on the alternate air and water reservoir and pipe connecting said reservoir with the air receiver, in combination with a double cock; the arrangement being such that communication between the reservoir and the air receiver is established, and stopped simultaneously with the admission to and emission from the reservoir of water, substantially as herein set forth.

Also, the combination with the alternate air and water reservoir, and air-discharge pipe connecting the same with the air receiver, of a valve or its equivalent, operated by a float so as to automatically close the said discharge pipe and stop the supply of water, substantially as hereinbefore shown and described.

No. 38,251.—ABNER SYLVESTER, of Dubuque, Iowa.—*Improvement in Grain Separators.*—Patent dated April 21, 1863.—The riddles are of an oval form and their upper convex sides flattened in the middle portions so as temporarily to detain the grain which falls through while the chaff, heads, &c., fall over the edges and are caught by a receptacle underneath; these riddles are arranged in pairs for the more equal distribution of the work, and each pair is driven by an eccentric on a common shaft, so that one pair moves to the right while the other moves to the left.

Claim.—The oval form of the riddles flattened on the middle portion, substantially in the manner and for the purpose set forth.

Also, arranging said riddles in pairs, the upper ones in one pair and the lower one in another pair, so as equally to divide the quantity of matter in each pair and thus diminish greatly the momentum which the riddles tend to acquire by their movement together, substantially as and for the purpose set forth.

No. 38,252.—FREDERICK A. TROUT, of New Britain, Hartford county, Conn.—*Improvement in Combined Plumb and Levels.*—Patent dated April 21, 1863.—On one of the faces of the level stock is a quadrant plate having a vernier of 90° and a radial bar pivoted at the centre of the quadrant, on which is carried a spirit-level. To work to the horizontal line this radial arm is brought parallel with the length of the level stock; to work to an angular elevation it is vibrated to the required degree on the vernier and secured in position by a thumb-screw.

Claim.—The employment of the right-angle and circular plates B B', traverse bar D', and tube C, in combination with a spirit-level stock, substantially in the manner and for the purpose described.

No. 38,253.—JOSEPH WELLS, of Hoboken, N. J.—*Paper Bag Machine.*—Patent dated April 21, 1863.—The paper is fed from a continuous roll to the folder wheel, where it passes between the blocks, the fold being a short distance from the centre, so as to leave a strip, which is bent over, pasted, and flattened by the devices on the upper edge of the block; it is then cut by the serrated revolving roller, with the lower half longer than the other, and turned by the plate with the centre to the edges, so as to bring the longer portion flat underneath the plate, from whence it passes to the draught roller, the pasting plate, and folder, which close the strip over, finishing the bottom of the bag.

Claim.—First, the guide blocks F G, constructed and arranged in respect to each other substantially as and for the purpose set forth.

Second, in combination with the said guide blocks the adjustable gauge wheel K, or its equivalent, as set forth, for the purpose specified.

Third, the arrangement of the lap-folders H I, in respect to each other and in combination with the said guide blocks, substantially as and for the purpose specified.

Fourth, the changing plate C with its securing rod J, or their equivalent, arranged and operating as set forth and for the purpose specified.

Fifth, the peculiar combination of the said changing plate and securing rod with the said severing knife and feeding rollers, substantially as set forth.

Sixth, the combination of the pasting plate O, or its equivalent, with the paste slot Z, substantially as set forth for the purpose specified.

Seventh, the combination of the said adjustable gauge wheel with the elliptical roller R, as set forth, for the purpose specified.

No. 38,254.—CHAS. O. WEST, ELIEL WEST, and JOHN CAREY, of Martinsville, Clinton county, Ohio.—*Improved Sugar Evaporator.*—Patent dated April 21, 1863.—The rear pan is divided by a partition and sets on transverse bars across the furnace opening. These bars have inclined planes near their ends and a depression at each mid length, so that either half of the pan can be slipped over the furnace and set upon the furnace wall. The flame, as it passes from under the front pans, is deflected by a plate depending from the crown of the fire chamber, so that it shall not impinge directly upon the bottom of the rear pan.

Claim.—First, the two iron bars J J, provided with depressions *j*, and inclined planes at their mid lengths and ends respectively, for the purpose of allowing one or other of the pans F F', to rest firmly down upon the walls of the furnace when in use for boiling, and thus to receive the full intensity of the heat, or to be elevated from the walls of the furnace and away from the fire when in danger of scorching by simply shifting the pans on the track in the manner specified.

Second, the arrangement of the deflecting plate or fender P depending from the furnace crown immediately in front of the "teache" opening B, for the purpose set forth.

No. 38,255.—J. E. WOOTTEN, of Philadelphia, Pa.—*Improvement in Railroad Car Springs.*—Patent dated April 21, 1863.—The spiral springs work between plates into which they are inserted by means of spiral grooves in the latter which match the coil.

Claim.—The spirally-grooved orifices in the plates A *a*, for securely holding the ends of the springs when used in combination with the spiral springs of a railroad car spring.

Also, the spring, constructed as herein described, in which the ends of the individual resilient parts thereof are permanently secured to the plates A *a* and serve the purpose of firmly holding the entire spring in one compact whole, which is equally capable of resilience under tensile, compressive, or lateral strains, without the intervention of lugs, bolts, rivets, or stays, in the manner and for the purpose herein set forth.

No. 38,256.—CHARLES J. WOOLSON, of Cleveland, Ohio.—*Improvement in Ash Boxes for Stoves.*—Patent dated April 21, 1863.—The invention consists of a detached ash-box to be fastened below the fire-door to the oven door or side plate of the stove to catch the ashes as they are scraped or fall out of the fire chamber.

Claim.—Attaching a portable ash-box, when constructed as described, to the oven or side plate of a cooking stove, below the fire-door, in the manner and for the purposes substantially as set forth.

No. 38,257.—BENJAMIN Q. BUDDING, of Milford, Mass., assignor to BENJAMIN D. GODFREY, of same place.—*Improved Rolling and Polishing Machine.*—Patent dated April 21, 1863.—The object of this machine is to dress, roll, and solidify the soles of boots or shoes, and this is accomplished by setting the last on which the boot is fixed on the upper end of an arm, which is capable of being inclined and controlled by springs and levers, so as to present the sole at any required inclination; a rest supports the toe and a roller is caused to traverse with a reciprocating motion over the sole, moving on a slide and actuated by a pitman and crank from a wheel on a vertical axis; the required pressure is given by a treadle attached by a rod to the end of the slide ways on which the roller carriage traverses, and which is capable of angular movements to suit the requirements of the work.

Claim.—Combining with a holding mechanism a mechanism which, while carrying a roll or rubber back and forth, at the same time permits vertical and angular movements to the roll or rubber, for the purpose of adaptation to curved or irregular surfaces or outlines.

Also, controlling the clamping or holding of the matter to be operated on through the medium of the treadle *j*, and its spring *o*, the ratchet *f'*, pawl *m*, and its spring *n*, and stop *q*, or their equivalents.

Also, combining with the ways *a a'*, over which the rubber or roll is reciprocated, the transverse or rocking levers *b'*, and lever *f'*, operating together for the purpose as above set forth.

No. 38,258.—GEORGE CLARK, of Sandusky, Ohio, assignor to Self and ROBERT DUNBAR, of Buffalo, N. Y.—*Improvement in Grain Cleaners.*—Patent dated April 21, 1863.—The grain is admitted into a central chamber, from whence it is distributed by the conical valve *C'*, and the cone *C*, into an annular chamber, where the blast of air carries light grain, and offal, upwards and into the chamber under the dome; here the heavier particles fall and are discharged at the spout *Q*, while the lighter ones go to the suction blower, and are driven through it out of the machine. At the base of the drum is a cylindrical casing, which projecting downwards, deflects a larger or smaller proportion of offal to the lower discharge.

Claim.—First, the cylinders or shells *A A'*, arranged with a suction air space *B* between them, in combination with the adjustable valve *T*, for the purposes and substantially as described.

Second, the cone distributor *C*, and automatic cone apex *c'*, in combination with the cylinders or shells *A A'*, and central grain supply tube *F*, for the purposes and substantially as set forth.

No. 38,259.—DE GRASSE FOWLER, jr., assignor to Self and MERWIN FOWLER, of Northford, New Haven county, Conn.—*Improvement in Paper Cards for Hooks and Eyes.*—Patent dated April 21, 1863.—Strips are punched up from the card which form tongues for the attachment of the hooks and eyes.

Claim.—The attachment of hooks and eyes, by the means of tongues or strips partially separated and projecting from the card, substantially as hereinbefore set forth.

No. 38,260.—A. W. HALL, of St. Louis, Mo., assignor to Self and B. W. ROBINSON, of South Reading, Mass.—*Improvement in Steam Ploughs.*—Patent dated April 21, 1863.—This locomotive steam engine has a gang of ploughs attached to it, and draws itself and them by means of a rope which is stretched across the field and which passes between traction pulleys on the engine.

Claim.—The employment of a steam engine or its equivalent motive power, in combination with a series of two or more traction pulleys *f f'*, to be used in connexion with a rope extended across and properly secured at each end of the field; all being constructed and arranged to operate in such manner that the said motive power may be made to draw itself and the gang of ploughs attached across the field, substantially as herein described and represented.

No. 38,261.—CHARLES W. S. HEATON, of Belleville, St. Clair county, Ill., assignor to JABEZ J. PIGGOTT and HENRY REUTCHLER, of same place.—*Improvement in Cultivators.*—Patent dated April 21, 1863.—This invention consists of a two-wheeled cultivator with the plough-beams hinged at their forward ends, and the frame so arranged as to straddle the row of half-grown corn without breaking it; the various adjustments of the parts and the details of construction are defined in the claims.

Claim.—First, the truss-frame *A*, constructed in the manner described, in combination with short axles and vertical outside hangers *i i*, as and for the purpose set forth.

Second, the guard-brace *E*, arranged and operating substantially as described.

Third, the combination of the long tongues or poles *K' K'*, neck yoke *M*, reach *L*, and brace *N*, substantially as and for the purposes set forth.

Fourth, the combination of the adjustable seat *O*, reach *L*, long tongues *K' K'*, neck yoke *M*, and brace *N*, substantially in the manner described.

Fifth, a shovel beam formed of two parts *B B'*, which make an angle, in combination with a slotted standard *s*, which is adjustable, substantially as and for the purposes set forth.

Sixth, the combination of the jury-brace *t*, which is adjustable, with the double beam *B B'*, and slotted standard *s*, substantially as and for the purpose set forth.

Seventh, the arrangement of the foot levers *n*, curved bars *p p*, notched cross-piece *q*, roller *m*, and cords or chains *o*, substantially as and for the purpose set forth.

Eighth, the arrangement of the slotted adjusting pieces *c*, pendent share-beams, and draught device *I*, with single swingle-trees and frame *A*, and outside hangers *i i*, in the manner and for the purpose described.

Ninth, the combination of the slotted pieces *C*, brace rod *E*, frame *A*, and pendent share-beams, substantially as and for the purpose set forth.

No. 38,262.—JOHN JENNINGS, of Birmingham, England, assignor to S. & J. MYERS, of Boston, Mass.—*Improvement in Spectacles*.—Patent dated April 21, 1863.—The central bridge piece of these self-supporting spectacles is elongated and made of a harp-shape, to embrace the nose more perfectly than two mere salient edges.

Claim.—The spring harp-shaped bow *b*, when united to the lense frames *a a*, as shown, to make them self-supporting, and when so united as to admit of being spread without much deviation from the centre of vision, as herein represented.

No. 38,263.—ANSON JUDSON, assignor to Self, LEMUEL BEERS, and FREDERIC W. BEERS, of Brooklyn, N. Y.—*Improvement in Coal-Oil Lamps*.—Patent dated April 21, 1863.—The burner of this lamp has panes of translucent material in a metallic frame, or a cone of said material on a metallic foot.

Claim.—The construction of the cone of a flat-wick kerosene, petroleum, or coal-oil lamp partly of transparent or translucent material and partly of metal; the two being combined together as hereinbefore set forth or in manner substantially equivalent.

No. 38,264.—WILLIAM A. PURVIS, of Madrid, St. Lawrence county, N. Y., assignor to DAVID W. BALDWIN, of Watertown, N. Y.—*Improvements in Drag Saw*.—Patent dated April 21, 1863.—The log-supporting frame is set transversely with the saw frame, and the former moved when desired by throwing the driving mechanism in gear with a drum which draws upon the rope by which the log-carrier is advanced. The log is fastened to the carriage by a sliding adjustable yoke mounted upon the log-frame, and the saw is guided by a swinging guide frame with side braces to prevent lateral deflection.

Claim.—First, the combination of a saw frame with a transverse log-supporting frame and a mechanism for drawing up the log, so constructed and arranged in relation to the saw-driving mechanism that the latter may be caused to operate the former at pleasure, substantially as set forth.

Second, the combination of the log-supporting frame with a sliding and adjustable yoke constructed as herein described to firmly grasp logs of any dimensions and immovably to hold the same to the action of the saw substantially as set forth.

Third, the combination of the saw-driving mechanism with the yoke mounted upon the transverse log-frame and an adjustable friction or other gear so constructed and arranged and operating that the said yoke may be slid along the said frame and the log drawn up to the action of the saw the requisite distances at the will of the operator, substantially as set forth.

Fourth, connecting the one end of the shaft of the adjustable friction or other gear with a spring lever pivoted to the frame, while its other end is placed in fixed bearings in the frame, substantially as set forth.

Fifth, the combination with the saw-driving mechanism of a swinging guide frame and the saw guide block, so that the saw, in its reciprocating play, may be properly guided, at the same time allowing it to descend during the progress of the work, substantially as set forth.

Sixth, the employment in combination with a reciprocating saw-blade of converging side braces, whereby the flexible saw is, during part of its operation, literally stiffened, substantially as set forth.

No. 38,265.—O. C. SMITH, of Salem, Mass., assignor to A. N. CLARK, of Boston, Mass.—*Improvement in Looms*.—Patent dated April 21, 1863.—This loom is adapted to the weaving of elastic fabrics, and the points of improvement consist in a swinging frame to take up the slack of the warp which has passed between the elastic and non-elastic rollers which regulate the tension; and also in a method of driving the shuttles by reciprocating racks and pinions, which engage with teeth on the sides of the shuttles.

Claim.—First, the swinging frame *j* arranged and operating substantially as herein-above described, and for the purpose of taking up the slack in the warp threads.

Second, the elastic and non-elastic nipping and feeding rollers operating together and upon the elastic threads passing between them, substantially as herein-above described.

Third, the peculiar arrangement of devices herein described for operating the shuttles of the loom, the same consisting of the rack bars *u u'*, pinions *t t*, &c., and vertical lever *b'*, connected with and receiving motion from the driving shaft of the loom, substantially as set forth.

No. 38,266.—JOHN TAGGART, of Roxbury, Mass., assignor to Self and LIVERAS HULL, of Charlestown, Mass.—*Improvement in Mounting and Operating Ordnance*.—Patent dated

April 21, 1863.—The chassis on which the cannon are mounted has a rotary movement on an axis parallel with the motion of the gun as it is run "in battery," so that while one is in its usual position on the top, the other preserves its attachment to the carriage and chassis, but is suspended below.

Claim.—Either one or two cannons and a rotary chassis or slide frame, arranged and combined in manner and so as to operate together substantially as specified.

Also, a pivot carriage or traversing platform, one or two cannons, and a rotary chassis or frame, combined and arranged in manner so as to operate substantially as above specified.

No. 38,267.—RUDOLF WAGER, of Lancaster, Pa., assignor to Self and GUSTAVUS GROEZINGER, of same place.—*Improved Liquid Composition for Bating Skins or Hides.*—Patent dated April 21, 1863.—After the hides have been limed, they are soaked in a liquor prepared as follows: For a batch of fifty hides, take eight pounds muriatic acid, eight pounds aquafortis, three pounds common salt, and add water till Baume's hydrometer will indicate 36°. Fifteen to twenty minutes in this solution will remove the lime. For smaller skins the strength is reduced 30° and 20°.

Claim.—The materials added to water, in the formation of the bate, in the manner substantially as set forth, in the process of treating skins or hides for the purpose specified.

No. 38,268.—SAMUEL S. WILLIAMS, of Pittsburg, Pa.—*Improvement in Water Elevators.*—Patent dated April 21, 1863.—The improvements are in the bucket and the mode of tripping; the former has a partial covering, on which are hooks, one of which, as the bucket rises, engages with a tripping bar, which is pivoted to the sides of the curb, so as to tilt the bucket, and at the same time draw it out of the perpendicular to discharge the water into the spouts.

Claim.—The partial covering to the top of a tilting well-bucket, with an opening on each side of the bale, substantially as described.

Also, the yielding trip for tilting the buckets, constructed and arranged substantially as described—that is to say, having its centre of motion below the point at which it first comes in contact with the top of the buckets, and hence descending in the line of an arc of a circle as it is carried over the trough.

Also, in combination with the yielding trip, the hooks or other equivalent device to engage the trip, when placed back of the mouth or opening in the buckets for the discharge of the water, so that the water, as it is discharged from the bucket, shall not run over the hook and trip, substantially as described.

No. 38,269.—ENOCH OSGOOD, of Boston, Mass.—*Improvement in Self-balancing and Self-closing Faucets.*—Patent dated April 21, 1863.—In the vertical chamber of the faucet is a valve closing by an upward motion, and whose stem, passing upward, is connected to a diaphragm of such a size as that the pressure of water between them will keep the valve closed, except when forcibly opened by pressure upon the stem of the valve, which may be regulated to suit the purposes of a water-closet, or otherwise.

Claim.—First, a valve and a diaphragm connected together and arranged as herein described to hold and resist any pressure of fluids that may come between them to pass out through the valve for use, the diaphragm to be any degree larger than the valve requisite to give it any closing power wanted, the valve closing against the current of water, when relieved of the action of the lever K, or its equivalent.

Second, in combination with the foregoing, an adjustable graduating pressure, attached to resist the closing of the valve as desired for water-closets, and other purposes, substantially as and for the purpose herein described.

No. 38,270.—J. A. THOMPSON, of Geneva, N. Y.—*Improvement in Filters.*—Patent issued April 21, 1863.—Antedated November 29, 1861.—The filter is divided into strainers and separators, disinfecting, decolorizing, and deodorizing sections, arranged so that the water passes through them serially, the coarser sediment being arrested by cloths which may be readily renewed. The ice is placed in a chamber of non-conducting material.

Claim.—A filter and cooler for water and other liquids, constructed and arranged and operated substantially as described.

No. 38,271.—S. ACKLEY, of Hudson, Mich.—*Foot-Warmer.*—Patent dated April 28, 1863.—A foot-table is made of two sheets of metal attached to each other at or near the ends, and kept open in an elliptical form by studs *f*, or other suitable contrivances. The lower sheet is shorter, or narrower, than the upper one, and constitutes a deflector for the flame and heat of the lamp. The top or upper sheet is of the full width of the frame, in which the contrivance is enclosed so as to retain the heat within the frame and between the two sheets of metal, of which the foot-table is composed, and also to allow the heat to pass between the upper and lower sheets. The table is made to rest on stays or bearings attached to the frame. The lamp is held in position by slides at the bottom of the frame so as to allow of its removal for trimming, and is furnished with a curved reflector *m* of sheet metal attached to the wick tube.

Claim.—A foot-table *d d* of a foot-warmer or stove, constructed substantially in manner as and for the purpose described.

No. 38,272.—J. HOLMES AGNEW, of Dobb's Ferry, N. Y.—*Improvement in Boots*.—Patent dated April 28, 1863.—The inventor makes an incision in the instep of a boot two or three inches long, according to the size of the boots. Below the incision he places a tongue or strip of leather fastened at both ends, so as to allow the foot to pass it. The two sides of the incision are provided with eyelets so that it can be laced. When, after long walking, or continued riding, the feet are swollen, the lacing can be loosened, and after the swelling of the feet subsides it can be tightened again.

Claim.—As an improved article of manufacture a boot having an opening or incision B in its instep provided with a lacing D, or other suitable fastening, and covered by a tongue C, attached at both ends to the inner side of the boot below the opening or incision; all substantially as set forth.

No. 38,273.—NORMAN ALLEN, of West Meriden, Conn.—*Improvement in Vices*.—Patent dated April 28, 1863.—The vice is mounted upon a ball fitting within a socket in a pair of jaws, which are pivoted at one end to the bed-plate, and at the other or free end are enclosed with a clasp provided with a set screw and a cam lever, by means of which the ball may be grasped to secure the vice in any position or released to permit its adjustment.

Claim.—The combination of the vice and universal joint, when the latter is provided with adjustable jaws or a clamp having a clasp and lever, or an equivalent fastening applied to it, and all arranged to operate as and for the purpose specified.

No. 38,274.—JOSEPH ANTHONY, of Greenbush, Rensselaer county, N. Y.—*Improvement in Railroads*.—Patent dated April 28, 1863.—This invention consists in appliances for securing the rails firmly in their place laterally and vertically, and preventing them being displaced by the jarring incident to their use.

Claim.—The following devices as described and for the purposes set forth in the above specification: First, the anchor-sleeper; second, the elastic cushion having double flanges; third, the combination of the anchor-sleeper, elastic cushion, the wedge or block, the rail, the sleeper, and the gage bar.

No. 38,275.—THOMAS D. AYLSWORTH, of Pine Bend, Dacotah county, Minn.—*Improvement in Grain Drills*.—Patent dated April 28, 1863.—This instrument consists of a roller in a frame which is preceded by a set of drag-shares and a seeding box with spouts. The shares are of a V-shape and attached by springs to a rock-shaft, by whose rotation under the actuation of a lever the shares are caused to penetrate more or less deeply into the ground. This rotation brings a pressure upon the card by which the seed roller derives its motion from the shaft.

Claim.—First, the V-shaped drill teeth H attached to the rock-shaft G by means of the springs I I, in the manner and for the purpose set forth.

Second, the combination of the teeth H, rock-shaft G, and lever K; provided with the pulley i, as and for the purposes above described.

Third, the combination of the teeth H, tubes J, and seed-rollers D, provided with adjustable cells as above set forth.

Fourth, mounting a seeding machine, provided with the teeth H, rock-shaft G, and lever K, upon rollers A A, in the manner and for the purposes above set forth.

No. 38,276.—CYRUS W. BALDWIN, of Boston, Mass.—*Improvement in Sewing Machines*.—Patent dated April 28, 1863.—The features embraced in this improvement are several, and may be especially examined by reference to the claim and drawings. They apply to a revolving reversible hook in a circular head to take and release the loop, a spool-holder with spreaders, with other appliances.

Claim.—First, the revolving and reversible hook K, in combination with the circular head H and its accompanying devices for enabling the hook to take and release the loop, constructed and operated substantially as herein described and for the purposes set forth.

Second, the bobbin or spool-holder Q, with the spreaders g g, constructed and operated substantially as herein described and for the purposes set forth.

Third, the revolving hook K, constructed and operated as described in my first claim, in combination with the bobbin or spool-holder and spreaders as described in my second claim, the whole constructed and operating as and for the purposes herein described and set forth.

Fourth, the adjustable cam g', with the spring i, the screw j', the cylinder b', and the slot h', in connexion with the shaft c, constructed and operating substantially as herein described for the purposes set forth.

Fifth, the adjustable cam g', constructed and operating as described in my fourth claim, in combination with the cam or eccentric c', and also with the spring feeder e' and rough feeder f, the whole constructed and operated as herein described and for the purpose herein set forth.

No. 38,277.—N. P. BASSETT, of Fulton, Oswego county, N. Y.—*Improvement in Fly Traps*.—Patent dated April 28, 1863.—This improvement consists in an admitting and detaining cover for an ordinary tumbler, it having a hole in the middle with a flange around its inner edge.

Claim.—The cover B, when provided with an opening c, surrounded at its lower edge by a flange d, and used in combination with a tumbler A, or other similar or suitable vessel, to form an improved fly-trap as herein set forth.

No. 38,278.—J. A. BOWLUS, of Fremont, Sandusky county, Ohio.—*Improvement in Sugar Evaporators*.—Patent dated April 28, 1863.—The object of this improvement is to stir up and skim the evaporating juice, and this is effected by a vibrating skimmer which is attached to a segment wheel, and as it vibrates, traverses by the mashing of the wheels of the segment in those of a rack on the end of the pan, sweeping the scum into side chambers provided for its reception.

Claim.—First, the arrangement of oscillating arms *e* with slats *g*, in combination with the shaft *f*, toothed segments *h*, and racks *i*, and with inclined sides *b* of the pan A, constructed and operating in the manner and for the purpose substantially as specified.

Second, the arrangement of the side channels E, in combination with the skimmer D and pan A, as and for the purpose shown and described.

No. 38,279.—CHRISTOPHER C. BRAND, of Norwich, Conn.—*Improvement in Revolving Fire-arm*.—Patent dated April 28, 1863.—This revolver has a cylinder shorter than the cartridge, and as the cylinder is rotated to bring another cartridge to the barrel, it is drawn back and again advanced to its position; in this movement the lock participates, and while the stock, barrel and trigger retain their permanent connexion, the sliding portions operated by the lever move in recesses in the stock which act as guides to the cylinder in its motions; a percussion pin located within the case transmits the blow of the hammer.

Claim.—First, the combination of a cylinder shorter than the length of the cartridge case used therein, and having, when operated, a compound back-and-forth and rotary motion, and a lock in such a manner that these two move together in a recess or recesses in the stock while the stock remains permanently connected with the barrel of the fire-arm, substantially as hereinbefore set forth.

Second, the combination with a cylinder having a sliding and rotary motion, and a lock moving with the cylinder to and from the barrel in a recess in the stock of a trigger, permanently connected with the stock, the whole being arranged to operate substantially as set forth.

Third, the combination with a sliding revolving cylinder, sliding with the lock in a recess or recesses in the stock of a lock case of such construction that it performs the functions of guiding the cylinder and protecting the lock, while moving to and from the barrel, substantially as herein set forth.

Fourth, the combination with a sliding revolving cylinder and a lock containing guide case when moving together in recesses in the stock, to and from the barrel, of a percussion pin located within said case, to transmit the blow of the hammer to the cartridge in the barrel, substantially as set forth.

Fifth, the combination of a lever which moves the sliding and revolving cylinder in a recess of the stock to and from the barrel, and of a mechanism for operating the revolution of the cylinder under such arrangement that when the said lever is raised on a pivot on the rear end thereof, the cylinder is drawn back and in line with the barrel and rotated upon its axis, substantially as herein set forth.

No. 38,280.—CHRISTOPHER C. BRAND, of Norwich, New London county, Conn.—*Improvement in Breech-loading Fire-arm*.—Patent dated April 28, 1863.—The breech-block is recessed to receive the flanged end of the cartridge, which is thus constructed to enable the casing to be drawn more readily from the barrel after discharge. The breech-pin carries the lock and slides back and forth under the impact of a lever and link, and it is provided with a bolt at its forward part which enters a socket under the barrel, forming a guide and stay, the main-spring being located within the cavity of the bolt.

Claim.—First, in breech-loading fire-arms in which a breech-pin is used, sliding in a recess in the stock and moving together with the lock to and from the barrel, the breech-block recessed in front to receive the flanged end of the cartridge, in combination with a hammer and hook, the latter being pivoted by a friction joint in the breech-block, and actuated by the hammer, substantially in the manner and for the purposes hereinbefore set forth.

Second, in breech-loading fire-arms, in which a sliding breech-pin, together with the lock, is moved to and from the barrel by a lever and an intermediate link, as described, guiding the said breech-pin by means of a hollow guide bolt made in one piece with or permanently attached to the said breech-pin, in combination with the arrangement of the main-spring within the cavity of the bolt, substantially in the manner and for the purpose hereinbefore set forth.

No. 38,281.—S. C. BRINSER, of Middletown, Dauphin county, Pa.—*Improvement in Horse Rakes*.—Patent dated April 28, 1863.—This invention consists of a clearer or vibrating rod, and its connexions, which is so arranged that as the tooth bar is tripped for the discharge of the hay, this bar, protruding within the range of the teeth, sweeps between in such a way as to disengage the load. It consists of three parts, the clearer, rock shaft, and connecting rod, the latter being attached to the vibrating arm which actuates the tripping mechanism.

Claim.—The combination with the teeth C, treadle K, levers J H, and connecting rod I of the pivoted frame N n, toothed clearer O o, and connecting rod P, all constructed, arranged, and operating in the manner and for the purposes herein shown and described.

No. 38,282.—FRANKLIN H. BROWN, of Chicago, Ill.—*Improvement in Needles for Sewing Machines*.—Patent dated April 28, 1863.—This needle is made hollow from a point above

that which is reached in passing through the cloth to a point near the end, and a slit on the side of the needle with a threading hole at the top of its tubular recess affords the means of introducing the thread; a bulge on the lower part of the needle makes so large an opening that the needle plays freely, and a deviation in the slit above the bulge forms a lip which assists in threading the needle.

Claim.—First, the lip *d*, or its equivalent, made and constructed as and for the purposes set forth.

Second, the slit *c*, in combination with the hollow part of a needle, made and constructed as and for the purposes set forth.

Third, the threading hole *b*, in combination with a slit and hollow part of a needle, made and constructed as and for the purposes herein described.

No. 38,283.—THOMAS COBLEY, of London, England.—*Improvement in the Manufacture of White Lead.*—Patent dated April 28, 1863.—The improvement consists in grinding or crushing the lead ore, roasting it in a furnace and treating it with acetic acid in a gaseous or liquid form, in such proportions as to form a subacetate of lead. The liquor thus obtained is discolored by passing through animal charcoal, and then precipitated by allowing it to trickle down in a chamber, which is supplied with carbonic acid, whereby the excess of oxide in the subacetate is thrown down as carbonate of lead; the precipitate is then washed. To render it an oxy-carbonate it is treated with alkaline ley to withdraw the carbonic acid, and then dried for market.

Claim.—First, the manufacture of white lead from crushed or ground ore carbonates of lead, by the process set forth, or by means substantially the same.

Second, the method of treating precipitated white lead with a caustic alkaline solution for the purpose of producing an oxy-carbonate of lead, by which it is rendered more amorphous and less crystalline and the covering properties of lead are largely increased.

No. 38,284.—MILLS L. CALENDER, of New York, N. Y.—*Improvement in Lamps.*—Patent dated April 28, 1863.—The invention consists in making the body of the lamp of vulcanized India-rubber, and in the adjustment and adaptation of the parts—such as the method of attachment of the handle by a loop-spring and hook-catch; of the slide which carries the upper works of the lamp, and is retracted on a tubular guide affixed to the upper part of the handle; of the chimney case, the interior cup and cover, the chimney cap or cover, the annular reflector which may act as a shade, sliding on the chimney or suspended by a holder attachment; also, a construction of the flame orifice, so as to flatten the flame of a roundwick.

Claim.—First, the use and application of vulcanized India-rubber, gutta percha or similar material, as a lamp body, or the receptacle for oil, in combination with a wick-tube and burner.

Second, attaching the handle to the top of a lamp or burner in the manner substantially as described, by a groove loop-spring and hook-catch *F*.

Third, securing the chimney holder and appliances to the lamp or burner by a spring, for the purposes and in the manner substantially as represented; also combining the spring and handle, substantially as represented.

Fourth, using a horizontal slide or spring-slide attached to the chimney-holder for the purposes and in the manner substantially as represented.

Fifth, the perforated cup *B*, for the purposes specified.

Sixth, the cover *J* to the perforated cup *B*, when used in the manner and for the purposes substantially as described.

Seventh, a corrugated metallic chimney-case, arranged in the manner and for the purpose substantially as described.

Eighth, broadly, a lamp chimney-cap *N*, or draught protector, as described, or its equivalent.

Ninth, a metallic reflector to a lamp, with an orifice in its centre for the chimney to pass through.

Tenth, a centrally perforated metallic reflector to a lamp in combination with a suspensory or adjustable holder or attachment, whereby the reflector is secured to the chimney at any height.

Eleventh, a brevet metallic combined reflector and shade, for the purposes and in the manner as described, substantially.

Twelfth, a suspensory shade or reflector holder and slide, substantially as described when formed or cut from one piece of metal.

Thirteenth, the formation of the deflector or diaphragm *L*, where the opposite sides of the round flame orifice are raised or convex, so as to flatten the flame of a round wick.

Fourteenth, a lamp arranged with any or all the improvements substantially as described.

No. 38,285.—THOMAS COBLEY, of Hahl, Bavaria.—*Improvement in the treatment of Metallic Silicates and the Manufacture of Hydro-fluo-silicic Acid.*—Patent dated April 28, 1863.—Patented in England July 9, 1861.—The claim is sufficiently explicit.

Claim.—First, the application of fluorine for desilicizing metallic bases as herein described and set forth.

Second, the manufacture and production of fluo-silicic acid and silica by the same process simultaneously in and combination with the process for desilicizing mineral products in the manner herein described and set forth.

No. 33,286.—THOMAS COBLEY and JAMES C. COOMBE, of Hahl, Bavaria, and Hoxton, Great Britain.—*Improvement in the Manufacture of Porcelain, Glass, &c., by the use of Fluo-Silicates.*—Patent dated April 28, 1863.—Patented in England July 15, 1861.—The claims are very full and perfectly explicit.

Claim.—First, the application of fluo-silicates in combination with artificial silicates of the alkalies, alkaline earths and other earthy bases, to the manufacture of glass, pottery, porcelain and other ceramic and plastic wares, and more particularly the substitution of the fluo-silicic salts of the alkalies, alkaline earths and other earthy bases for the phosphoric compounds of the same or other bases in the manufacture of glass, pottery, porcelain, and other ceramic and plastic wares.

Second, the application of the fluo-silicates of lead and baryta, either separately or together, to the manufacture of glass and porcelain, either as a glaze or as a pigment, and either applied and used as direct or real fluo-silicates or by the admixture of any salt of lead or baryta with any fluoric or silicious or fluo-silicious material, so as to obtain the same results as if the fluo-silicate had been actually employed.

Third, the application of fluo-silicate of tin as a pigment or glaze or enamel in the manufacture of porcelain, of baryta in combination with fluo-silicate of zinc, as a substitute for lead in the manufacture of glass, and in combination with fluo-silicate of tin as a glaze or enamel in the manufacture of porcelain; and of the fluo-silicate of zinc, either alone or in combination with fluo-silicate of baryta, in the manufacture of glass, substantially as described and set forth in the body of this specification.

No. 38,287.—JAMES CANE COOMBE, of Hoxton, Middlesex, Great Britain.—*Improvement in Indurating and Preserving Stone, Cements, Wood, &c.*—Patent dated April 28, 1863.—Patented in England March 14, 1861.—The process consists in applying hydro-fluo-silicic acid to the stone or other material which contains potash, lime, or other alkali, so as to form an insoluble combination therewith; if the material does not possess the alkali, it is first to be impregnated with an alkaline solution and then treated with silicic acid. In the manufacture of artificial stone or cement, precipitated silica is mixed with lime, mortar, cement, or other material, and treated with hydro-fluo-silicic acid.

Claim.—First, the process herein described for indurating and preserving stone, brick, slates, wood, and other analogous materials, by the use of a solution of the fluo-silicic acid, in the manner substantially as set forth.

Second, the process herein described for the manufacture of artificial stones, mortar, cement, and such like substances, by the employment of hydro-fluo-silicic acid, precipitated silica, lime and alkalies, in the manner set forth.

No. 38,288.—JAMES A. COWLES, of Chicago, Illinois.—*Improved Clasp for Closing Preserve Jars.*—Patent dated April 28, 1863.—The jar has a shouldered neck with a conical stopper, the edges of the latter resting upon packing on the shoulder in the neck of the jar; a double wire clasp, whose bow fits upon the summit of the stopper, and whose ends embrace firmly the neck of the bottle under the shoulder, is then pushed on, and, by its rigidity, binds the stopper firmly to its seat.

Claim.—The clasp *d d d*, operating and working substantially as described.

No. 38,289.—C. O. CROSBY and HENRY KELLOGG, of New Haven, Conn.—*Improvement in Double-Frilling.*—Patent dated April 28, 1863.—The claim is perfectly clear, and needs no explanation.

Claim.—The article of manufacture called double-frilling, having the essential characteristics substantially as described, or, in other words, made of one piece with a centre line of crimps or plaits, each with a well defined edge secured in place and held flat and smooth by at least two longitudinal seams, with two frills composed of crimps, extending outwards from such seams, the crimps or plaits outside of the seams gradually expanding to the edges of the completed article.

No. 38,290.—EPHRAIM CULVER, of Shelburne, Franklin county, Mass., and THOMAS J. POMEROY, of East Hampden, Hampshire county, Mass.—*Improvement in Window Sash Fasteners.*—Patent dated April 28, 1863.—A vertical rod is attached to the window casing, above and below, and projecting from each sash is a post, through which the rod passes and to which it is fastened by a set screw, retaining the sash in any position.

Claim.—The rod C, the posts A and B, and the thumb-screws E or F, in combination for the purpose herein specified.

No. 38,291.—LEWIS H. DAVIS, of West Chester, Pa.—*Improvement in Pumps.*—Patent dated April 28, 1863.—The hollow cylinder is arranged within the barrel, and the piston works in packing between the two; the water is alternately taken in and expelled at each end by means of ports and valve chambers, in which are rolling valves. The packing of the piston rod, and of the piston, are both tightened by screwing in the gland or collar at the end of the barrel which compresses the packing against which it impinges, and also drives the cylinder against the packing in which the piston works.

Claim.—First, the hollow cylinder G, arranged within the barrel A, between the cover b and packing H, substantially as and for the purpose herein set forth.

Second, in combination with the packing H, cylinder G, and its projection h, the gland or follower d, the whole being so arranged and constructed that the packing for the piston and piston rod may be tightened simultaneously by forcing the said follower d in the cover b.

Third, the chambers K K' and L, with their respective valves and openings, the whole being arranged in respect to each other, and to the chambers of the barrel, to the air vessel, and to the suction pipe, substantially as set forth.

No. 38,292.—WILLIAM H. DEGGES, of Washington, D. C.—*Improved Propeller.*—Patent dated April 28, 1863.—The propeller is formed of two blades, projecting from the hub, and a cover or cap, which projects over to prevent "slip."

Claim.—Forming the blades or threads of the screw of the two plates b b and the cap d, as and for the purposes herein set forth.

No. 38,293.—WILLIAM H. DEGGES, of Washington, D. C.—*Improved Rudder.*—Patent dated April 28, 1863.—The shape of the horizontal section of the rudder is that of a wedge with a rounded head; the latter sets within a groove in the stern-post. The sides of the rudder are grooved where they abut upon the edges of the stern-post when the rudder is "hard up."

Claim.—Constructing rudders of the form and having the front surface and the groove at its sides, as herein set forth.

No. 38,294.—WILLIAM H. DEGGES, of Washington, D. C.—*Improvement in Ship-Building.*—Patent dated April 28, 1863.—The under-side of the vessel is recessed by longitudinal depressions continuous throughout its entire length, in which work the screw propellers out of the range of shot or collision.

Claim.—As an improvement in the construction of vessels, so forming the sides thereof as that recesses continuous throughout the length of the vessel will exist therein, as and for the purposes herein set forth.

No. 38,295.—WILLIAM D. DORSEY of Decatur, Macon county, Ill.—*Improvement in Cultivators.*—Patent dated April 28, 1863.—The machine consists of a frame on wheels, with a draught pole and two beams carrying two shares attached to the frame by a clevis in front and resting upon the hind transverse beam at their rear ends. The beams are raised and the shares withdrawn from the ground by the feet of the driver on levers connected by rods to the plough beams.

Claim.—The arrangement, in the manner herein shown and described, of the two adjustable share frames I I and the operating foot levers L L with each other and with the bars E E, the pole A, and the driver's seat C, all as set forth.

No. 38,296.—DANIEL DRAWBAUGH, of Eberly's Mills, Cumberland county, Pa.—*Improvement in Millstones.*—Patent dated April 28, 1863.—The cone on the top of the driving spindle is made removable, and the arms on the spindle which drive the balance rines are so arranged with set screws as to impinge upon each of the arms equally.

Claim.—First, in combination with the driving arms and the rines the set screws for making uniform and equal contact between them, and thus regulate the driving force at all four points of contact, substantially as and for the purpose described.

Second, supporting the runner on the top of the spindle by means of a removable or adjustable pin or plug, for the purpose of preserving this point of suspension as near the centre of the stone, as it wears away, as possible, substantially as described.

No. 38,297.—ASAHEL K. EATON, of New York, N. Y.—*Improved Chrome Compound.*—Patent dated April 28, 1863.—The invention consists of the manufacture of chromite of baryta. A formula is given.

Claim.—The chromite of baryta as a new article of manufacture.

No. 38,298.—ASAHEL K. EATON, of New York, N. Y.—*Improvement in Ink for Printing Bank Notes, &c.*—Patent dated April 28, 1863.—The improvement consists in the use of chromite of baryta as an ingredient in printing ink, it being unaffected by re-agents, and its color being a guard against counterfeiting by photography.

Claim.—The use of the chromite of baryta as a tint for the protection of bank notes and other similar work.

No. 38,299.—MATT ELLIS, of South Carver, Plymouth county, Mass.—*Improvement in Farmers' Boilers.*—Patent dated April 28, 1863.—The invention consists in making a flue around the boiler, inside of the casing, by means of a cut-off and rim, so that the heat is compelled to go around instead of passing immediately into the chimney.

Claim.—The cut-off g g and rim b b b b, in connexion with the cylinder or drum a a a a and boiler K, as and for the purposes specified.

No. 38,300.—Cancelled.

No. 38,301.—MOSES G. FARMER, of Salem, Mass.—*Improved Alloys of Aluminum*.—Patent issued April 28, 1863.—Antedated January 3, 1863.—The improvement consists in combining copper and aluminum with one or more light-colored metals, the proportions varying for different purposes, such as composition for bearings of machinery, gun metal, or as a substitute for gold in jewelry, watch-cases, chains, &c.

Claim.—The alloys within described as compounded substantially of the metals and in the proportions set forth.

No. 38,302.—GEO. FINLEY, of Collins Township, Alleghany county, Pa.—*Improvement in Adjustable Lamp-wick*.—Patent dated April 28, 1863.—The improvement consists in lengthening the frame of the burner below the level of the base of the cone, leaving a sufficient opening to introduce a pair of scissors to trim the wick, or a match to light it; and in so constructing the wick-holder as to slide downwards in the burner and to lower the wick sufficiently for this purpose where it is out of the influence of the draught in the cone and chimney.

Claim.—Constructing and arranging the wick-tube in relation to the burner and cone or cap of lamps, substantially as hereinbefore described, so that the wick-tube may be depressed at pleasure, so far as to bring the top of the wick below the base of the cone or cap, and away from the influence of the draught produced by the cone, the burner frame below the cone being furnished with an opening or openings through which the wick can be lighted or trimmed for the purposes hereinbefore set forth.

No. 38,303.—ORLANDO V. FLORA, of Cincinnati, Ohio.—*Improvement in Carbon-Oil Lamps*.—Patent dated April 28, 1863.—The object of this improvement is to prevent the perturbation of the light caused by moving the lamp, and consists of a casing of corrugated and perforated sheet metal around the burner, and a flange forming a dish around the base to catch the air in the upward motion of the lamp.

Claim.—The corrugated body or case C of perforated metal or material, substantially as and for the purposes herein specified.

Also, the concave flange D, in combination with the corrugated, perforated body or case, substantially as and for the purpose herein set forth.

No. 38,304.—JOHN W. FOSTER, of Racine, Wis.—*Improvement in Automatic Gates*.—Patent dated April 28, 1863.—This gate is on the lazy tongs principle and divides in the middle and separates to both sides by the weight of the carriage or other moving body on the platform on either side of it.

Claim.—First, applying the power to open and close the gate to the ends of bars N' O', working in guide slots *o* above and below stationary points *i*, upon which the gate is supported.

Second, the boss E, working upon a vertical guide-rod F, and employed in combination with levers C and H to communicate the required motion to the gate or gates from a weight applied to any part of the platform B.

Third, the described combination and arrangement of the levers C H K M, connecting rods J L R and R', and springs G and S, with the platform B and gate or gates, for the purposes specified.

No. 38,305.—BENJAMIN GARVEY, of New York, N. Y.—*Improvement in Coal-Oil Lamps*.—Patent dated April 28, 1863.—The invention consists in proportioning the size of the wick-tubes to the quantity of carbon in the vapor of coal-oil so that the oil will be perfectly consumed without smoking; and to obtain a given amount of light, a sufficient number of these tubes are placed side by side so that their combined flames are equivalent to a large one and expose a greater relative surface to the oxygen of the air.

Claim.—First, wick-tubes, the diameter of which is determined in the manner and for the purpose substantially described in the accompanying specification, taking one-sixteenth of an inch as the average diameter of tubes for general use.

Second, the combination of two or more such wick-tubes for the purpose of producing one large flame by the combination of two or more small flames, in the manner described substantially in the accompanying specification.

No. 38,306.—ROBERT H. GRATRIX, of New York, N. Y.—*Improvement in Dyeing Wool, Silk, &c., with Aniline Colors*.—Patent dated April 28, 1863.—The improvement applies to animal substances, which are prepared for dyeing by being steeped in a solution of chloride of lime of the strength of 4° Twaddle, and then in a solution of sulphuric acid of a strength of 2° Twaddle. They are then washed and are ready for dyeing in the ordinary manner.

Claim.—The application to yarns or fabrics made of worsted, wool, silk, or other animal substances, of the solution herein specified, preparatory to dyeing with colors derived from aniline or analogous substances, substantially in the manner described.

No. 38,307.—ISAAC HALDERMAN, of Bucyrus, Ohio.—*Improved Washing Machine*.—Patent dated April 28, 1863.—The semi-cylindrical rubber is worked by a handle, and is suspended by gudgeons in serrated boxes in the sides of the machine. Each roller in the rubber and concave is composed of a series of truncated cones which are arranged relatively to each

other so that the depressions of one shall match the salient edges of the other, and the suds box is put together with dovetail joints.

Claim.—First, the serrated boxes *a*, for the purpose herein fully described.

Second, the construction and arrangement of the truncated rollers *h*, in the manner herein set forth.

Third, the boxes *a*, combined with the rollers *h*, and the manner of constructing the tub B, the whole arranged substantially as herein set forth.

No. 38,308.—WM. M. HENDERSON, of Baltimore, Md.—*Improvement in Pumps.*—Patent dated April 28, 1863.—This invention consists of two valvular pistons on the same rod and working in a horizontal cylinder, which has a central induction valve and end eduction valves, through which the water passes into an air vessel above.

Claim.—First, the arrangement of the pump barrel A and the air vessel C, as herein set forth.

Second, two suction valvular pistons connected and moving together in the same line in a single barrel; the valves opening at different times and in opposite directions, yet moving with their pistons through the cylinder at the same time and in the same direction at any one stroke, in combination with a cylinder having a central suction pipe attached thereto, so as to be always between the two suction valvular pistons at all points of the stroke, as described.

No. 38,309.—JAMES HILL, of Providence, R. I.—*Improved Mode of Pointing Tags of Shoe Strings.*—Patent dated April 28, 1863.—The end of the tag is cut obliquely and the cut edges rolled together so as to form a conical end.

Claim.—Cutting a tag slantwise at its end and compressing and reducing it tapering or conically, the whole being substantially as represented.

No. 38,310.—PAUL KELLAR and JOSHUA ROGERS, of Sublette, Lee county, Ill.—*Improved Washing Machine.*—Patent dated April 28, 1863.—The vibrating rubber is of a semi-cylindrical form and has a perforated vertical partition; the concave on which it works consists of two pieces which are placed within the suds box and removable therefrom.

Claim.—The cross partition G dividing the rubber D into two compartments, when the said rubber is used in connexion with the removable sections B B', the whole arranged, combined, and operating substantially as and for the purposes herein set forth.

No. 38,311.—STEPHEN C. KETCHUM, of Winchendon, Worcester county, Mass.—*Improved Mode of Converting Motion.*—Patent dated April 28, 1863.—The motion is derived from the shaft, which has a disk attached to it, upon which works a hooked rod with a slot in it enclosing the end of the shaft; the rod is also provided with a pin which works in a cam-groove in the face of the disk, the revolution of which communicates a reciprocating motion to the rod and an alternate circular or oscillating motion to the crank pin on the shaft to which the lower end of the rod is attached.

Claim.—The combination of the rotating shaft E, disk B, hooked and slotted rod D, and pin *c*, the whole arranged and operating substantially as and for the purpose herein specified.

No. 38,312.—EUGENE JOSEPH LAURENT, of France, (now residing in America.)—*Improvement in Machines for Making Trimming.*—Patent dated April 28, 1863.—On the periphery of a rotating pattern block are projections on which the braid or other trimming is placed while it is being fastened; various adjustments are placed around it, such as means for holding it steady while sewing the members of the trimming together, also a tension, bobbin spindles, and a take-up roller.

Claim.—A rotating pattern block fitted with projections suitable for holding trimming until its members are fastened together, the design of the trimming being determined by the arrangement of said projections.

Also, the combination of said rotating pattern block with means for holding it from turning, the whole operating substantially as herein set forth.

Also, the combination of said rotating pattern block with a cord tension, the whole operating substantially as herein set forth.

Also, the combination of said rotating pattern block with one or more supports for thread bobbins, substantially as herein set forth.

Also, the combination of said rotating pattern block with a holder for supporting the same, the whole operating substantially as herein set forth.

Also, the combination of the said rotating pattern block with a stripper, the whole operating substantially as herein set forth.

No. 38,313.—WM. H. MAPLE, of Chariton, Lucas county, Iowa.—*Improvement in Corn Planter.*—Patent dated April 28, 1863.—This planter has a frame and three shares—one in front to furrow out, and two behind to cover. The corn is dropped down a spout behind the forward share by means of a shaft, crank, and lever operating a seed slide.

Claim.—The shaft K provided with a crank *i*, and the lever I connected with the crank *i*, as shown, for operating the seed slide H, when said parts are applied to, or used in combina-

tion with, a beam A having three shares E C C attached to it, and all arranged as set forth.

No. 38,314.—ROBERT J. MARCHER, of New York, N. Y.—*Improvement in the Manufacture of Wooden Mouldings or Strips for the Frames of Mirrors, Pictures, &c.*—Patent dated April 28, 1863.—The outer part of the frame is made with an ogee or other moulding, and a bead is inserted into a groove in the inner face of said outer frame, which forms an inner finish and affords a rebate edge for the picture and glass to abut against.

Claim.—A moulding or strip for the manufacture of picture and other frames constructed of two parts or portions A B, connected together in the manner substantially as herein set forth.

No. 38,315.—GEORGE McCLEMENT, of Philadelphia, Pa.—*Hand Stamp.*—Patent dated April 28, 1863.—The socket has a solid face, on which the permanent letters are cut, and a slot in which the type are arranged and fastened by a temper screw. The end of the handle of the stamp abuts against the base of the type, being secured into the socket and fastened by a screw.

Claim.—First, the combination of the type box, constructed substantially as described, handle-bed A, and adjusting and holding devices *c* and *d*, all in the manner and for the purpose set forth.

Second, the combination of screw-threaded handle-bed A *b*, type box B *a*, and screw *d*, or its equivalent, in the manner and for the purpose described.

No. 38,316.—A. Y. McDONALD, of Dubuque, Iowa.—*Improvement in Screw Wrenches.*—Patent issued April 28, 1863.—Antedated April 8, 1863.—The shank of the stationary jaw has holes, in which a stud on the socket of the screw is dropped to adjust the movable jaw, which is further moved by the rotation of the screw which works therein.

Claim.—The sliding jaw U provided with the spring E, in combination with the stop H and screw F, the latter being fitted in an internal or female screw *a* in the jaw D, and the stop H, provided with a projection *c* to fit in holes *d* in the shank A of the stationary jaw C, substantially as and for the purpose herein set forth.

No. 38,317.—WM. L. McDOWELL, of Philadelphia, Pa.—*Improvement in Grates.*—Patent dated April 28, 1863.—The curved and horizontal portions of the two middle grate bars are removed, and there is attached to the front parts of the adjacent bars a cross-piece, on which the front end of a removable bar may rest, while its rear end is supported by a depression in the hind bar of the grate.

Claim.—Combining the draw-bar B with a basket grate A by removing the horizontal and curved portions of the two bars *a' a'*, of latter, and connecting the two adjacent bars *a2 a2* together by means of the depressed cross-piece *a3*, constructed substantially as described, to serve as a retaining support for the front end of the said draw-bar B, while its rear end is supported in the depression *a4*, with its upper side in the same horizontal plane as the upper sides of the remaining bars of the grate, substantially as described and set forth, for the purpose specified.

No. 38,318.—WM. L. McDOWELL, of Philadelphia, Pa.—*Improvement in Stoves.*—Patent dated April 28, 1863.—The fire-box is surrounded by a series of nearly vertical plates, of which the lower edge of one is within the upper edge of the one below it, so as to leave a space through which the heated air can pass into the apartments, the air reaching the said heating space through orifices in the annular plate which surrounds the base of the fire-box.

Claim.—First, the employment of a perforated supplementary top plate C in combination with the usual top plate of the base of a stove, substantially in the manner described, for the purposes specified.

Second, the employment of a series of deflecting plates D D1 D2 D3, arranged and supported around the cylinder or fire-box of a stove so as to operate in the manner described and for the purposes specified.

No. 38,319.—DAVID H. METCALF, of Battle Creek, Calhoun county, Mich.—*Improvement in Stoves.*—Patent dated April 28, 1863.—The wall of the lower part of the stove is made double, forming an annular air-heating chamber around the furnace or fire-box. This is supplied with air from below the fire-box through a chamber and openings around its upper margin. The air passes into the apartment through damper openings in the side of the outer chamber, and the upper cylindrical portion of the stove is made of a single thickness, and acts as a radiator.

Claim.—First, combining with a sheet-iron "air-tight" stove a short air-heating chamber *d*, perforated bottom *c c c*, air-heating chamber E', and exit pipes *g g*, substantially as described.

Second, a sheet-iron "air-tight" stove, having the double bottoms *b E* and the air space E', substantially as and for the purposes described.

Third, a sheet-iron "air-tight" stove so constructed, with conducting pipes *f*, or their equivalents, that it is an air-heater below and a radiator above, in the manner described.

Fourth, the damper openings *g g* and exit pipe *f* in combination with the air-chamber *d E'* and single wall top G, substantially as described.

No. 38,320.—C. A. MILLS, of Hazel Green, Grant county, Wis.—*Improvement in Coffee Roasters*.—Patent dated April 28, 1863.—The roaster is placed over a fire, and the coffee kept in motion by clock-work, driven by a spring, which likewise actuates a fan that serves as a governor for the spring, and introduces a draught of air to keep the spring cool.

Claim.—The combination of the air-entrance F and the fan D with the air-case E, the spring C, and the roasting vessel G, as herein shown and described, so that the movement of the latter will be regulated, and the spring will be kept cool, all as set forth.

No. 38,321.—DANIEL MOORE, of Brooklyn, N. Y.—*Improvement in Revolving Fire-arms*.—Patent dated April 28, 1863.—The invention consists of a revolving cylinder with chambers partially open at the rear end, and charged at the forward end; the partial opening at the rear of the chambers being covered by a fixed circular abutment so to sustain the force of the explosion, in combination with a fixed abutment projecting from the stock against the open portion of the chamber in line with the barrel. It also consists of a swinging gate in the bracket of the piece to keep the cartridge in the chamber or opening, and to allow the withdrawal of the spent capsule.

Claim.—First, the circular abutment 2, at the rear end of the cylinder, partially closing the chambers, in combination with a fixed abutment 3, projecting from the stock and covering the open portion at the rear end of the chamber on line with the barrel, as set forth.

Second, the gate *o*, fitted to swing on the centre 8 upon the bracket *c* of the barrel, and when closed retain the cartridge cases in the chamber, as set forth.

No. 38,322.—WILLIS E. MOORE, of Crawfordsville, Ind.—*Improvement in Metal Cartridges for Cannon*.—Patent issued April 28, 1863.—Antedated December 18, 1863.—The improvement consists of a cartridge whose case is made of metal and tapers to a point at its rear with weak points, by which a portion of the contained gases resulting from the explosion are admitted behind the case and expel it from the gun.

Claim.—First, effecting the discharge of the metal case of a cartridge, substantially as set forth.

Second, a cartridge made of taper form, and with one or more weak points in its circumference, substantially in the manner and for the purpose set forth.

No. 38,323.—JACOB H. MUMMA, of Harrisburg, Pa.—*Improvement in Straw-Cutters*.—Patent dated April 28, 1863.—The straw as it passes to the cutter is carried between two rollers, the upper one having longitudinal grooves and edges alternately, and teeth inserted in the grooves; and the lower one having annular flanges or corrugations around its periphery.

Claim.—First, the ribbed and toothed roller for drawing and masticating the straw.

Second, the flanged roller underneath for assisting the drawing of the straw forward to the cutter bar.

No. 38,324.—J. R. MURPHY, of Pittsburg, Pa.—*Improvement in Sash-Fastenings*.—Patent dated April 28, 1863.—The invention consists of two pivoted arms, whose presser ends are closed together by a spring under the finger and thumb pieces, and thereby impinge upon the side of the window frame to retain the sash at the desired height; the sash being freed by the pressure on the spring which withdraws the pressers from contact with the window frame.

Claim.—A sash-fastener composed of two pivoted knee-shaped pieces with cam-shaped presser feet controlled by a spring, the whole being constructed, arranged, and operating, in connexion with the window-frame, to hold the sash at any fixed point therein without the necessity of notches, rack, or other holding mechanism, substantially as herein described and set forth.

No. 38,325.—WALTER P. NEWHALL, of New York, N. Y.—*Improvement in Umbrellas*.—Patent dated April 28, 1863.—The brace, instead of being attached to the bow by a staple or stirrup, is pivoted into an eye formed by the bending of the bow itself.

Claim.—An umbrella, its rod or bow having the eye or loop for attaching the brace thereto formed from the continuous length of the said rod or bow by bending it in the shape substantially as hereinbefore described.

No. 38,326.—MARCUS ORMSBEE, of New York, N. Y.—*Photographic Printing Frame and Slide*.—Patent dated April 28, 1863.—The adjustments in this instrument to be placed over the negative are a perforated slide which is adjustable as to distance from the negative, a vignetting screen, and a glass sliding in guides and ground on both sides, so as to soften the light.

Claim.—First, a perforated slide D, of metal or other material, adjustable in its proximity to the negative plate, substantially as described.

Second, in combination with a main perforated slide of any suitable construction, the separate, independently adjustable perforated screens E E, employed in the manner and for the purposes set forth.

Third, the use of the doubly ground glasses G G, in the manner set forth, to soften and equalize the light.

No. 38,327.—GEORGE W. OTIS, of Lynn, Mass.—*Improvement in Window Ventilators*.—Patent dated April 28, 1863.—This improvement is to be inserted in the place of the upper part of a pane of glass which has been removed. It consists of a metallic plate, which is so bent as to rest upon the upper edge of the glass, and against the rebate of the frame, and is then bent over so as to form a shelter against rain. The upright part in the plane of the window glass has openings cut through it, and a register plate, with similar openings, slides in grooves in the former plate, to open or close the ventilator.

Claim.—A ventilating attachment to a window, consisting of the parts A B C X and *w*, or their equivalents, when arranged and combined with the sash and glass, all as herein shown and described.

No. 38,328.—LEONARD PARKER, of Winterset, Madison county, Iowa.—*Improvement in Bee-Hives*.—Patent dated April 28, 1863.—This hive is constructed with a lower chamber for a moth-trap, with entrance tubes made of perforated metal, and separated from the homestead above by a perforated partition. The homestead has a central portion devoted to brood comb, and in a chamber above are the usual honey boxes. The bee entrance consists of an alighting board, with perforated doors to close the hive, and a perforated cover for ventilation. The homestead has a vertical partition, with a guide on the alighting board to direct the bees into either apartment.

Claim.—First, the miller trap *g*, when arranged and constructed as herein described for the purpose set forth.

Second, the frame *s*, for brood comb, when used in combination with the homestead *d*, as herein described and for the purpose set forth.

Third, the arrangement of the guide *m*, doors *o*, and perforated cover *p*, when used in combination with the alighting board and entrance to the hive, as herein described and for the purpose set forth.

No. 38,329.—S. J. PARKER, of Williamsport, Lycoming county, Pa.—*Improvement in Shingle Machine*.—Patent dated April 28, 1863.—This invention belongs to that class of machines where the block is mounted on a reciprocating carriage and presented to a circular saw which removes a shingle. The claims are voluminous and sufficiently explicit.

Claim.—The vibrating block M, provided with the forks *o o*, and connected with the ratchet wheels D D by means of the connecting arms L L, crank arm E E, and pawls *l l*, when the same is operated by means of the stationary friction roller *q*, or its equivalent, in such a manner that the carriage is allowed a free movement forth and back, and the said ratchet wheels are actuated equally, whether the reciprocations are long or short; the whole arranged, combined, and operating substantially as herein set forth.

Also, the feed roller C, made of a hollow, metallic cylinder, with the shaft F passing through it, and with perforations in its periphery through which are driven the points *f f*, clenching against the shaft; the whole arranged as described, so that the roller is unaffected under all conditions, and feeds the bolt equally and uniformly, substantially as specified.

Also, securing the shaft E of the forward feed roller in hinged bearings *h h*, and bracing it against side movement by means of a central-jointed bearing *e*, which allows it to adapt itself with equal pressure to an inclined or uneven end of the shingle bolt, substantially as herein described.

Also, in combination with the feed roller supported by hinged bearings *h h*, the vertical shaft G, jointed connecting bar *i*, and sliding rod H, for expanding the rollers for inserting the bolt, the whole arranged and operating substantially as herein set forth.

Also, the combination of the two separated spring sliding rods H and I, so arranged that they allow the carriage to slide freely forward and back without impediment, but come in coincidence when the said carriage is drawn fully back, so that the feed rollers may be expanded by their action, substantially as herein described.

Also, in combination with the curved sliding stop-bar S, having notches *a' a'*, or their equivalents, the adjustable gauge rod U, provided with the horizontal arm *n'*, the whole arranged so that the length of stroke of the carriage is adapted to the size of the bolt to be sawed, substantially as herein set forth.

Also, in combination with the subject-matter of the preceding clause, the inclined track or way T, arranged substantially as and for the purpose herein described.

Also, the shoulder *k'* of the stop bar S, the eccentric *d'*, stop *b'*, cam *w*, and sliding sleeve Q, provided with the friction roller *v*, or its equivalent, in combination with the pinion O, for the purpose of coupling and uncoupling the latter to and from its shaft, arranged substantially as herein described.

Also, connecting the eccentric shaft R with the vibrating lever C' by means of the inclined crank *p'*, connecting bar W provided with the slot *q'*, arm A', and rock-shaft B', the whole arranged and combined in such a manner that the said eccentric shaft is turned backward by the action of the lever, so as to permanently uncouple the driving pinion at any time, and so that the automatic action is carried on without impediment, substantially as herein specified.

Also, the cross-head H' of the driving shaft, in combination with the spur wheel D', provided with the pins *t' t'* and the spiral spring I', arranged and operating substantially as and for the purposes herein set forth.

No. 38,330.—EDWARD JUANES Y PATRULLO, of New York, N. Y.—*Improvement in Machinery for Separating the Fibre of Tropical Plants*.—Patent dated April 28, 1863.—The invention consists of a revolving drum armed with teeth, and scraping surfaces between, which revolves at a high velocity within a case, and strips the fleshy portions from the fibres of the leaves which are presented by the toothed feed-rollers to the action of the drum.

Claim.—The improved machine herein described, for the preparation of the fibre of Agave Americana and the like tropical plants, the same consisting of a drum with widely separated combs formed with teeth *b b* and scraping surfaces *b'*, substantially as represented, operating at a high velocity within and under a closely fitted stationary case, and combined with feed rolls adapted to allow the presentation and removal of the leaves substantially in the manner and with the advantage herein set forth.

No. 38,331.—JAMES M. PEIRCE, of Mokena, Will county, Ill.—*Improvement in Gates*.—Patent dated April 28, 1863.—The gate is suspended by rollers from a pivoted rail which is raised or lowered by cords. On raising the end of the rail the rollers travel down the inclined plane and open the gate, and on restoring the rail to its former position it is inclined in the other direction, and the gate travels on its hanger rollers and closes the gateway.

Claim.—The combination of the rising and falling gate carrier or rail *C* with the shoulders *f*, gate *B*, and cords *h*, in the manner herein shown and described, so that by pulling one of said cords the gate will be opened and fastened open, and by pulling the opposite cord the gate will be removed from the shoulder *f* and caused to close by its own gravity, all as set forth.

No. 38,332.—TIMOTHY R. PORTER, of Syracuse, N. Y., and GEORGE H. COOK, of New Brunswick, N. J.—*Improvement in Flue Walls for Salt Blocks*.—Patent dated April 28, 1863.—The fire walls on each side of the furnace are built hollow so as to prevent the conduction of heat to the surrounding earth, and the fire may be supplied with air through the chambers thus formed.

Claim.—The application of hollow walls to the construction of flue walls in salt blocks, substantially as set forth in the foregoing description and drawings.

No. 38,333.—WILLIAM C. RAY, of Redington, Hunterdon county, N. J.—*Improvement in Presses*.—Patent dated April 28, 1863.—In this machine the screw of the press passes through a nut which is pivoted in a lever which has a vertical and longitudinal motion on its fulcrum, the longer end of said lever being depressed by a weighted yoke lever, the whole being so arranged as to give play to the nut, which is free to oscillate and adjust itself under the pressure of the levers.

Claim.—The combination of the screw *J*, pivoted nut *I*, yoke lever *F*, and links *G*, with the weighted levers *D*, the whole being arranged and operating as described, for the purposes set forth.

No. 38,334.—JOHN A. REED, of Jersey City, N. J.—*Improvement in Direct Action Steam Pumps*.—Patent issued April 28, 1863.—Antedated January 23, 1863.—The steam and the pump cylinder are placed in line with a piston in each on a common piston rod. Each cylinder is surmounted with a cock valve connected by means of a tappet rod, and actuated by a tappet arm on the piston rod, so as at the same moment to change the movements of the pistons.

Claim.—The combination of the two cock valves *B D* on the steam and water cylinder, the levers *d d'*, weights *E E*, tappet rod *f*, and tappet arm *h*, on the piston rod, the whole combined and operating substantially as herein specified.

No. 38,335.—ISAAC REHN, of Philadelphia, Pa.—*Mode of Preventing the Counterfeiting of Bank Notes, &c.*—Patent dated April 28, 1863.—This invention is directed against the counterfeiting by engraving, while at the same time securing against counterfeiting by photography, and it is accomplished by producing bank notes of which a portion is engraved and the balance of the work executed by photo-lithography or photo-zincography, so as to defy imitation by the graver.

Claim.—The combination of the work of engraved plates with photo-lithography or other modes of photography upon metal or other substances from which impressions may be printed in ink for the production of bank notes or paper values, as set forth in the above specification and accompanying exhibits.

No. 38,336.—JAMES REID, of New York, N. Y.—*Improvement in Revolving Fire-arms*.—Patent dated April 28, 1863.—The rear ends of the chambers are arranged so as to be fired with fixed ammunition or to be fitted with a nipple plug for loose ammunition. A vibrating segment plate in connexion with the recoil plate covers the rear end of the cartridges.

Claim.—First, the nipple breeches screwed into the rear ends of the chambers in the revolving cylinder, in combination with the recoil plate at the rear of the cylinder, fitting in such a manner as to allow of the removal of said screw nipple breeches and the introduction of fixed ammunition, as set forth.

Second, the segmental plate *i*, fitted, as specified, on the side of the recoil plate *h*, to cover the rear ends of the cartridges in the chambers *2 2*, as set forth.

No. 38,337.—ROBERT RICE, of Georgetown, Vermillion county, Ill.—*Improvement in Cultivators*.—Patent dated April 28, 1863.—The side bars are adjustable, as to distance from the middle bar, by means of the transverse bars sliding in mortises, and the detaching and securing of the curved side braces of the standards. The braces which connect the side and central bars forward are elastic, and admit of a certain amount of adjustment. The handles are partially supported on an elastic bar so as to reduce the jar in the hands of the operator.

Claim.—First, the connecting of the front ends of the bars *a a* of the implement to the draught pole B, by means of the elastic plates *b b*, in combination with the cross-bars *c c* fitted to the draught pole B and passing loosely through the bars *a a*, and with the braces *e e* attached to the plough standards C C and the cross-bars *c c*, as herein set forth.

Second, the handles E E, attached at their front ends to the draught pole B, by means of screws or bolts *g*, in combination with the spring or elastic bar *i*, and the upright D, on which the rod *h* bears, substantially as and for the purpose herein specified.

No. 38,338.—THOMAS D. ROBERTS, of Utica, N. Y.—*Improvement in Handsaw*.—Patent dated April 28, 1863.—The frame is made of a single piece of wood bent to the right shape, and the straining piece has a double nut in which its ends are socketed so as to be lengthened or shortened by the rotation of the nut.

Claim.—First, a saw frame B, constructed of a single piece of wood bent in the form substantially as and herein shown and described.

Second, the nut D, and screws *d d*, applied to the bars C C, and the latter arranged with the saw frame, either constructed as shown or in any proper manner, for the purpose of straining the saw-set, as set forth, and this saw-straining device whether one screw *d* is used or both of them, as herein set forth.

Third, the combination of the saw frame B, constructed of a single piece of wood, as shown, with the nut D, bars C C, and screw or screws *d d*, as herein specified.

No. 38,339.—SAMUEL ROEBUCK, of Brooklyn, N. Y.—*Improved Mosquito Canopy*.—Patent dated April 28, 1863.—The improvement consists in the construction of the head to which the arms are fitted, the same being placed within loop projections on the flange of the socket and capable of being vibrated on their connecting wire and collapsed when not in use.

Claim.—The head A, formed of a socket *a* and flange *b*, the latter being provided with loop-projections *d* and shoulders *e*, the loop-projections being provided with indentations *f*, which, in connexion with the shoulders *e*, hold the wire D in proper position for the purpose specified.

No. 38,340.—GELSTON SANFORD and JAMES E. MALLORY, of New York, N. Y.—*Improvement in Machinery for Breaking Hemp and Flax*.—Patent dated April 28, 1863.—The hemp or flax is fed from a feeding table between two pairs of fluted rollers, which receive a reciprocating rotary motion from a crank vibrating an arm, in combination with a rotary motion not reciprocating, imparted by means of a pinion on the crank pin, so that the said additional rotary motion shall cause the rollers to have a greater range in the direction which the fibre is taking from the feed table to the point of exit from the machine.

Claim.—In mechanism for operating rollers for breaking or cleaning flax, hemp, or other like fibrous substances, imparting to such rollers a reciprocating rotary motion by means of a crank connected with an arm vibrated thereby, substantially as described, in combination with an additional rotary motion operating in one direction only and imparted by a pinion, or the equivalent thereof, on the crank pin, and communicated by cog-gearing to the rollers, the axis of the intermediate gearing being connected with the vibrating arm, which transmits the reciprocating motion to the rollers, substantially as and for the purpose specified.

No. 38,341.—S. M. SHERMAN, of Fort Dodge, Iowa.—*Improved Device for the Construction of Brooms*.—Patent dated April 28, 1863.—The broom-corn or other material is placed within pivoted jaws, where it is enclosed around the broomstick and there subjected to pressure by a plunger and screw which reduce it to the shape and density required for the head of the broom.

Claim.—The two bars A A in combination with the jointed bar F and the plunger, the latter being formed of the jaws E E, side pieces *f f*, and cross-bar *e*, and operated by the screw C, or its equivalent, all arranged for joint operation as and for the purpose specified.

No. 38,342.—JOHN SUTTON and JAMES GREGORY, of New York, N. Y.—*Improved Deck Lights for Vessels*.—Patent dated April 28, 1863.—This deck-light contains a "bull's-eye" in a metallic hinged frame and opens downwards, being pivoted to a lug on the under side of the deck. The window-frame is attached to the deck-plate by screws and the raised flange pressed firmly against the packing to exclude wet, the enlarged orifice of the hinge playing loosely on the pivotal pin to admit of the window-frame flange finding its level on the packing.

Claim.—First, the combination of the slot A, in the hinge E, of the frame containing the glass with the fixed pin or bolt *a* and the bearer *f* of the base-plate *g*, or equivalents, as and for the purpose herein fully shown.

Second, the combination of the sliding screw-bolt G, having an oblong channel B, with the lugs D of the door-frame, and base-plate *g*, as and for the purposes herein fully shown.

Third, the combination of the frame containing the glass F with the web C, as and for the purpose fully shown.

No. 38,343.—GEORGE W. TOWAR, of Detroit, Mich.—*Improved Lumber Raft*.—Patent dated April 28, 1863.—The cribs, two or more of which form a raft, are made with a bottom of longitudinal timbers and vertical side pickets driven into holes along the sides and end, and these stayed by traverse timbers and side fenders. The cribs are attached by ropes which pass around windlasses on each crib.

Claim.—First, the formation of the bow crib A, as shown and described.

Second, the arrangement of the windlasses D D at the ends of each crib for the purpose of producing an adjustable coupling, as specified.

Third, the pickets B, in the sides and end of cribs, in combination with fenders or wales G, enclosing and protecting the pickets, as and for the purpose set forth.

Fourth, the traverse timbers *b b*, securing the bottoms and tops of cribs, as described.

No. 38,344.—L. M. VAN SICKLE, of Woodbridge, N. J.—*Improved Construction of Gun Boats*.—Patent dated April 28, 1863.—The screw propellers are located between the hull and a downwardly projecting plated gunwale. They are formed of plates riveted to each other and to a spiral flange which winds around the central shaft.

Claim.—First, the arrangement of the extra plates H on the outer edges of the gunwales D in combination with the side propellers G G, constructed and operating as and for the purpose specified.

Second, the arrangement of spiral flanges *b*, projecting from the propeller shafts *c*, in combination with a series of single blades *a* fastened to each other and to the flanges *b* by means of rivets or bolts, substantially as and for the purpose specified.

No. 38,345.—L. F. WARD, of Marathon, Cortlandt county, N. Y.—*Improvement in Extension Ladders*.—Patent dated April 28, 1863.—The improvement consists in the method of locking the extension section so as to retain it at its elevation, which is by inclined planes attached to the upper section, which as they press against the spring catches in the lower section, push them in, and are retained by them when passed. Also, in a carriage which traverses the track formed by the side pieces of the ladder and is raised and lowered by a winch and rope.

Claim.—The inclined planes P P in combination with the spring catches P for locking the sections.

Also, the construction of the ladder in the manner and for the purpose substantially as described.

No. 38,346.—RICHARD WASHBURN, of Ramapo, Richland county, N. Y.—*Improvement in Straw Cutters*.—Patent dated April 28, 1863.—The motion of the lever has the effect of bringing down the knife upon the straw, and also, by means of a secondary lever, of lifting the bottom of the trough so as to meet the advancing knife, their motions being thus reciprocal towards and from each other.

Claim.—First, the combination of the reciprocating bottom C with the reciprocating knife E, in the manner substantially as herein shown and described, so that both the knife and the bottom shall have a simultaneous movement to and from each other all as set forth.

Second, the arrangement of the lever G in combination with the hand-lever D, link *d*, knife-head F, and link *b*, all constructed and operating in the manner and for the purpose herein shown and described.

No. 38,347.—SIGMUND WEIDENFELD, of New York, N. Y.—*Improvement in Preparing Grain, &c., for Malting*.—Patent dated April 28, 1863.—The ground grain is steeped in water, which is impregnated with gases resulting from the dry distillation of a mixture of sulphuric acid 4 parts, wood charcoal 2 parts, crystallized soda 1 part; one ounce and three quarters of this mixture being used to every hundred weight of meal.

Claim.—Mashing Indian corn, or any other kind of grain, by a cold solution, substantially as described.

No. 38,348.—JOSEPH H. WELTY, of Mount Carroll, Carroll county, Ill.—*Improvement in Bee-hives*.—Patent dated April 28, 1863.—The improvement consists in a tube to be placed between two hives as a means of communication between them; and it is provided with a slide and operating wire handle so as to be closed or opened as required.

Claim.—The application to bee-hives of the combination of the slotted tube B, its side C, and the wire D, when used as and for the purpose substantially as delineated and specified.

No. 38,349.—ANDREW JUDSON WHITE, of Brooklyn, N. Y.—*Improvement in Lamp Wick*.—Patent dated April 28, 1863.—The improvement consists of a roving of vegetable fibre covered with a coating of gluten by being passed through a vessel containing a solution of gluten, from whence it is passed to a tube to bring it to the proper shape and afterwards dried.

Claim.—A machine-made wick composed of unspun cotton, flax, or jute, covered and held together with gluten.

No. 38,350.—JAMES O. WHITCOMB, of New York, N. Y.—*Improvement in Magazine Field Batteries*.—Patent dated April 28, 1863.—This battery consists of a frame on wheels carry-

ing a row of gun barrels, and in connexion with them a series of rotation disks with chambers in their periphery, which are by rotation under suitable charge-chambers loaded with powder and ball, and discharged by electricity when they arrive opposite to the bore of the barrels. The rotation of the shaft carrying the disks is given by a hand lever click and ratchet wheel.

Claim.—First, one or more rotating cylinders or chamber blocks, in combination with the insulated igniting devices for discharging said chambers by electricity, when arranged at the breech of barrels as herein set forth and represented.

Second, The general arrangement and operation of the ratchet R and spring X with the lever L, click c, and spring t, when the ratchet R is fixed in the common shaft or axis a, with one or more of the rotating cylinders or chamber block C, as herein set forth and represented.

Third, the chargers d d d d working into the sockets G G G G, when used separately or in series, for the purpose herein set forth and represented.

Fourth, the sliding bar m with its two wedge-shaped pieces 1' 1, working against the studs of the springs 2' 2, in combination respectively with the rods I I, the check wires 6' 6' 6' 6' and 6 6 6 6, and also with the springs h' h, substantially as and for the purpose herein set forth and represented.

Fifth, the bullet pressers D D D D carrying the galvanic or voltaic battery wires p p p p, as herein set forth and represented.

Sixth, the relieving wires k k k k fixed to the shaft w, when made to work into and out of the bullet holders by motion communicated from the shaft e through the arms v and M and pitman l to said shaft w, as herein set forth and represented.

No. 38,351.—**ENOCH WHITTEMORE**, of North Paris, Oxford county, Me.—*Improved Wood Horse*.—Patent dated April 28, 1863.—The jaws of the horse are provided with teeth and a sliding frame between the jaws, which, being depressed by a treadle, causes the teeth on the said frame to approach the teeth on the jaws and firmly clamp the wood between them.

Claim.—The combination and arrangement of the jawed lever and its treadles with the wood horse, the same being substantially as and to operate together as specified.

No. 38,352.—**GEORGE WRIGHT**, of Washington, D. C.—*Improved Apparatus for Casting Fuzes*.—Patent dated April 28, 1863.—The "cope" and "nowell" which form the front and rear of the fuze, and the cheeks which form its periphery, are arranged in a frame, and the former are attached to cross-bars, which are mutually approached by spiral springs, or receded by cams to open and close the moulds into which the metal is poured.

Claim.—First, removing the cope e and nowel f from the fuze, while the latter is firmly held and supported by the cheeks K K, or their equivalents, for the purpose herein set forth.

Second, the arrangement of the cams G G, parts e and f and K K, and the means of guarding the same, substantially as and for the purpose herein set forth.

Third, moulding and removing a secondary part in the same machine with the main part, substantially in the manner and with the advantage herein set forth.

No. 38,353.—**ROBERT K. WRIGHT**, of Philadelphia, Pa.—*Improved Composition for Preserving and Water-proofing Leather*.—Patent dated April 28, 1863.—The composition is made as follows: Three pounds of gum copal dissolved by boiling in two quarts of linseed oil; when cold, add one gallon oil of turpentine, mix, and bottle tightly.

Second, take half a pound of caoutchouc and dissolve in a gallon of oil of turpentine. Mix four measures of the first-named composition with one of the latter and apply with a brush.

Claim.—The above-described composition for preserving leather, made of the ingredients enumerated, mixed or compounded in about the proportions specified.

No. 38,354.—**DUDLEY B. CHAPMAN**, of Milford, Worcester county, Mass., assignor to Himself and **EBENEZER D. DRAPER**, of the same place.—*Improvement in the Manufacture of Silicate Soap*.—Patent dated April 28, 1863.—Compounded of starch or other farinaceous matter, 2 parts; silicate of soda or potash, 4 parts; sulphate of soda, 2 parts.

Claim.—The combination of an alkaline silicate, a sulphate of soda or an anhydrous carbonate of soda, and a farinaceous or mucilaginous substance, the whole being substantially as described and for use as an ingredient of soap.

No. 38,355.—**CHARLES DEAVS**, of New York, N. Y., assignor to **ARCHER & PANCOAST** of same place.—*Improvement in Lanterns*.—Patent dated April 28, 1863.—The improvement is in the construction of the casing of the lantern, two sides of which are made of sheet-metal bevelled to serve as reflectors, and connected by cross-bars at the bottom; the other sides are occupied by panes of glass, and beneath the casing is the lamp which is hinged thereto. The guard wires, which are fastened to the lower edge of the casing, pass upwards and form a pivot for the chimney cowl, and also eyes for the attachment of the handle.

Claim.—First, the case or body C of the lantern formed of the glass plates e e, and a sheet-metal portion so cut or shaped as to form, when bent, two sides a a and the top b of the case or body, the lower ends of the sides being connected by cross-bars c c, substantially as set forth.

Second, the combination of the case or body C, constructed substantially as described, with the lamp A, the former being connected to the latter by hinges or joints D, as and for the purpose specified.

Third, forming the sheet-metal sides *a a* of the lantern with bevelled inner surfaces *j j*, to serve as reflectors, substantially as set forth.

Fourth, the rods F, bent at their upper ends to form pivots for the cap-piece E, and also to form eyes for the bail or handle G, and secured at their lower ends to the crossbars *c c*, to serve as guards for the glass plates *e e*, as herein described.

No. 38,356.—GEO. W. DUNCAN, of Bath, Maine, assignor to Himself and CHARLES DAVENPORT, of the same place.—*Improved Cat-block for Freeing a Ship's Anchor*.—Patent dated April 28, 1863.—The anchor hangs from the ring of the cat-block, being suspended below the cat-head. The block ring opens below by means of vibrating levers, one attached to each half.

Claim.—The combination of the tackle block B, and the lever ring hooks D D, and their chains E E, the said block to be suspended from a cat-head or a davit by means of a fall or rope C, and the whole to operate substantially in manner and for the purpose specified.

No. 38,357.—STUART GWYNN, of New York, N. Y., assignor to GEO. ODIORNE, of Boston, Mass.—*Improvement in Apparatus for Carbureting Gas*.—Patent dated April 28, 1863.—The invention consists in forcing the air from a condenser through a porous medium charged with hydro-carbon in a chamber, which is supplied from a reservoir which feeds it in quantities regulated according to its evaporation. The air from the generator is charged with moisture and passed through iron filings, whereby from the oxydization hydrogen gas is liberated and passed to the generator to overcome the excess of carbon in the carburetted air.

Claim.—First, the general arrangement and combination of apparatus, substantially as herein shown and described, for forcing the air through a porous medium diffusely charged but not filled with fluid, so that the air shall penetrate through as well as pass over the mass of porous substance, as herein set forth.

Second, the arrangement and combination of apparatus, substantially as herein shown and described, for maintaining the proper level of the fluid and effecting the vaporization, in the manner set forth.

Third, the arrangement and combination of apparatus, substantially as herein shown and described, for generating hydrogen gas to supply atmospheric air charged with the vapor of hydrocarbon fluids in proportion to the excess of carbon it contains.

No. 38,358.—ALFRED HEAVEN and ROBERT SMITH, of Manchester, England.—*Improvement in Embroidering Machines*.—Patent dated April 28, 1863.—Patented in England March 21, 1861.—This machine is applicable to that class of embroideries where the material is stretched on a vertical frame, on each side of which is a mechanism for grasping the double-pointed needle which carries the thread through the cloth. This improvement consists in the mechanism by which the reciprocating carriage is actuated and the driving belt of said carriage shifted to the fast and loose pulleys, the shifting motion being derived from the strain upon the thread.

Claim.—The combination of mechanism, herein described, for giving the carriage B its motion to and from the frame D when such mechanism is used in combination with the shipping mechanism, as set forth.

Also, the mechanism, substantially as described, for shipping the belt J from the fast on to the loose pulley, and from the loose on to the fast pulley, for the purposes as set forth.

Also, the employment of the tightened thread to actuate the shipping mechanism, as above described.

No. 38,359.—CHAS. W. SMITH and G. H. BABCOCK, of New York, N. Y., and B. B. HOTCHKISS and CHAS. A. HOTCHKISS, of Sharon, Conn.—*Improvement in Explosive Projectile for Rifled Ordnance*.—Patent dated April 28, 1863.—The shell is cast in one piece with an opening in front for the fuze plug and a shoulder in the interior to sustain a plate which divides the interior into two chambers, the rear one for the powder and the forward one for the balls, with a tube connecting the powder chamber with the point fuze.

Claim.—First, in explosive projectiles for ordnance, dividing the cavity into two parts by the plate B, or its equivalent, supported upon or by the body of the shell, so that it cannot be forced backward by the inertia of the balls C, but may be easily thrown forward by the explosion of the powder in D, substantially as and for the purpose herein set forth.

Second, the combination of the tube E, plate B, and fuze plug K, so arranged that the bullets C may be inserted through the mouth of the shell after the tube E is in place and the fuze plug caused to embrace the end thereof, substantially as herein shown.

Third, an explosive projectile in which the point is cast in one piece with the body, with a weak line G and with the plate B inserted in the cavity thereof, in the manner herein specified.

No. 38,360.—NATHAN STEDMAN, of Aurora, Ind., assignor to Self and JOSEPH MILLER, of same place.—*Improved Pump*.—Patent dated April 28, 1863.—In this pump the water is

discharged through a tubular piston rod from a pump located under the water level; the improvement consists in a double check valve on a lever at the bottom of the pump chamber, which valves alternately open and close by the motion of the plunger, and when the pump is at rest allow the water to run out to the level of the water in the well; and also in the construction of the plunger, which consists of two annular plates and stay rods, which occupy the central portion of the hollow plunger which connects with the discharging piston rod.

Claim.—The lever F, when used in combination and placed in relation with the two valves D E of the pump, to operate in the manner and for the purpose herein set forth.

Also, the piston valve formed of the two annular plates *g g'*, connected by vertical rods *h*, in combination with the holes *i*, in the upper and lower ends of the piston G, and the tubular piston rod H, all arranged for joint operation, as set forth.

No. 38,361.—PHILO P. STEWART, of Troy, N. Y.—*Improvement in Stoves.*—Patent dated April 28, 1863.—The invention consists in constructing the cylinder of the fire chamber with an annular hot-air chamber between the fire-bricks forming the inside of the said chamber and its outer casing. The hot-air space communicates with the fire chambers by orifices; there is also a cold-air chamber in the door, and one over the fire, the latter of which discharges air into the gases rising from the fire, and causes them to be consumed.

Claim.—The combination of the outer fire cylinder *c* with the annular hot-air chamber *s*, and with fire-brick perforated and forming the inner fire cylinder *d*, in the manner substantially as herein described and set forth.

Also, the perforated plate *m* and cold-air chamber *k*, in combination with the door *w*, having therein the cold-air chamber *z*, the whole being arranged over the fire chamber and annular hot-air chamber *s*, and for the purposes herein described and set forth.

No. 38,362.—MARSHALL SMITH, of St. Louis, Mo.—*Improvement in Mail Pouches.*—Patent dated April 28, 1863.—The invention consists of a mail pouch or trunk, which is divided off into apartments separately secured, so as to be suitable places of deposit for letters, and avoid the necessity of making them into bundles to be put into a common receptacle.

Claim.—The employment of the mail pouch A B, constructed substantially as herein described and represented, having one or more compartments, provided with the securing devices *e f g f'*, or formed with a series of chambers, substantially as herein shown, specified, and represented, for the purposes set forth.

No. 38,363.—PORTER FITCH, of Brooklyn, N. Y.—*Improvement in Mark Holder for Bales, &c.*—Patent dated April 28, 1863.—The improvement consists of an instrument having a metallic blade terminating in a point, and at the barbed end socketed into a holder by which it is thrust into the bale with the tag wire attached, and the handle being withdrawn the blade is left in the bale with the tag attached, the barb preventing its withdrawal.

Claim.—First, the blade D, as shown in Figs. 1 and 2.

Second, the dart D, as shown in Figs. 3 and 4.

Third, the use of the arms F F, in connexion with the shaft E, as shown in Figs. 1 and 2.

Fourth, the use of the blade D, the wire or chain I, and the tag T, in combination with the shaft E, substantially as shown in Figs. 1 and 2, all substantially as and for the purpose described.

No. 38,364.—THOMAS W. GOODWIN, Portsmouth, Va.—*Improvement in Engine Levers.*—Patent dated April 28, 1863.—The object of this improvement is to provide a means of starting in motion the main shaft of machinery when at a dead point by the pawls which work into the ratchet. The detail of the construction may be found in the claim.

Claim.—First, the lower end of the lever having slots *c c* and *e' e'*, dogs *d d d' d'*, and hinged joints *f*, Figs. 1, 2, 3 and 4, when used as and for the purpose herein described.

Second, the cross balance bar *h* and the pivot *k*, when used as and for the purpose herein described.

Third, the spring *n* and the springs O O, or their equivalents, when used as and for the purpose herein described.

Fourth, the eccentric loop *p*, the pin *p'*, and the handle *r*, when used as and for the purpose herein described.

Fifth, the lugs *t t'*, when used as and for the purpose herein described.

Sixth, the ratchet wheel *s*, made of two disks *s' s'*, between which the lower end of the lever *a* works on a main shaft *b*, all constructed substantially and for the purposes specified.

No. 38,365.—HENRY W. GOODRICH, of Chelsea, Mass., and EDWARD A. LOCKE, of Boston, Mass.—*Mark Holder for Bales, &c.*—Patent dated April 28, 1863.—This instrument consists of a barbed rod to be thrust into the bale, having on its end a distinguishing mark, or a means of attachment for one.

Claim.—As a new article of manufacture, a device constructed substantially as described, with barbs, corners, or indentations, or otherwise so shaped and arranged as to render it easy of insertion in, and difficult of extraction from, packages of fibrous material, when said device is provided with means for securing thereunto or therein an identifying mark or label, or is itself impressed with an identifying mark.

No. 38,366.—LOUIS ALBRIGHT, of Ottawa, Ohio.—*Breech-loading Fire-Arm.*—Patent dated May 5, 1863.—This arm is convertible for use with the common percussion cap, with the flanged metallic cartridge, or with percussion wafers or primers. The stock and barrel are joined by a web, to which is hinged a breech-piece or plug, in which the dog and other internal parts of the lock are contained. To the forward end of the first and third forms of plug is attached a blade, projecting laterally, which acts to sever and remove the but of the common cartridge. In the second form of the breech-piece is a sliding block N, connected to the hammer by a rod and pin to prevent the forward end of the plug from being intercepted by the projecting flange of the metallic cartridge cases, and which retracts on cocking and closes by the forward stroke of the hammer in firing. The third form of breech-piece or plug is also provided with a knife to open the cartridge, and with an automatic device to supply the primers to the touch-hole.

Claim.—First, the combination of the hinged and sliding breech-plug E E' or E'', carrying the dog, hammer and main spring, the trigger K, pivoted in the stationary stock, and the screw-threaded and milled abutment A', when the said parts are constructed, arranged, and operated in the manner and for the purpose specified.

Second, the knife L, projecting laterally from and flush with the forward end of the hinged plug E E' E'', and acting to sever and remove the but of the cartridge by the act of closing the plug, in the manner set forth.

Third, the hinged plug E', having the sliding block N adapted to be retracted to allow the passage of the said plug over a metallic percussion cartridge and to be closed automatically by the cocking and discharge of the hammer, as and for the purpose set forth.

Fourth, the arrangement of hinged plug E'', hammer H'', slide P, wafer magazine O, cap R, and touch-hole J, the whole being combined and operating together in the manner described.

Fifth, in the breech-loading arm above described, the employment of the exchangeable hinged breech blocks E E' E'', for the use of different forms of ammunition, as explained.

No. 38,367.—ANTOINE ANDRE, of Chicago, Cook county, Illinois.—*Improved Device for Stoppering Bottles.*—Patent dated May 5, 1863.—This invention consists in attaching a screw valve to a seat firmly fixed to the neck of the bottle so as to stop it effectually, or by retraction to allow communication with the funnel-shaped mouth-piece.

Claim.—A device for stoppering bottles, having in combination a screw valve A, passage f, channel g, and funnel-shaped mouth-piece C, all arranged and operating in the manner and for the purpose described.

No. 38,368.—BENJAMIN T. BABBITT, of New York, N. Y.—*Improved Marine Propeller.*—Patent issued May 5, 1863.—Antedated May 3, 1863.—This invention consists in the arrangement of one or more screw propellers, each within a stationary cylindrical casing with a peculiarly constructed chamber in front and rear of the casing, so as to discharge a column of water equal in area to the greatest submerged section of the vessel.

Claim.—The combination with one or more screw propellers, of chambers D H, constructed substantially as herein specified for the purpose set forth.

No. 38,369.—WM. R. BAGNALL, of Chelsea, Suffolk county, Mass.—*Improved Apparatus for Curing Caoutchouc.*—Patent dated May 5, 1863.—The object of this invention is to provide a vat and appliances for curing rubber, by which, while there is a large surface of rubber exposed to the curing fluid, there is a very small surface of the volatile fluid exposed to the atmosphere. This is accomplished by making the vat very deep in proportion to its width, and of a length adapted to the width of the sheet of rubber, there being a vertically adjustable partition with a roller at its lower edge descending deep into the vat, around which the rubber is drawn at a rate adapted to the requirements of the process.

Claim.—Constructing the curing vat with a narrow area at the level of the contained fluid and with a movable partition, operating substantially as specified.

Also, combining a vitreous or other suitable rod or roll with the movable partition, and also combining such rods or rolls with the vat at its upper edges, substantially as shown.

No. 38,370.—N. A. BOYNTON, of New York, N. Y.—*Improvement in Ventilating Dampers.*—Patent dated May 5, 1863.—In this improvement the damper and regulator are constructed on the slide register principle, with a perforated or slotted part, and in this case the damper is so combined with a ventilator as to regulate the fire and afford a means for ventilation. At the point of the flaring enlargement of the stove-pipe is a truncated conical contraction, and these diverging surfaces are slotted; inside of this V-shaped annular recess is a double-slotted flanged shell fitting it, and by rotation opening or closing both sets of apertures.

Claim.—The employment of the double-slotted flanged shell C, in combination with the slotted projection B and slotted shell A, the parts being constructed and operating together, substantially in the manner herein shown and described.

No. 38,371.—ABRAM BRIGHAM, of Lawrence, Mass.—*Improved Pipe-Drainer.*—Patent dated May 5, 1863.—The object of this invention is to place it in connexion with a pipe which is liable to be choked by a collection of water of condensation; and it consists of a

floating ball in a suitable chamber of a peculiar construction, which is connected by a pipe, with the passage to be kept clear, the ball floating in water, and being elevated upon a stem to which two valves are attached, which work in two seats above and below a discharging chamber with a partition between.

Claim.—First, the cover of the box A, made hollow in the form of a circular tube or pipe with the under side perforated in order to distribute the condensed steam equally when it enters the drainer, in combination with wire P and air valve L, substantially as described.

Second, the making the valve seats with a partition T between them, for the purpose herein set forth.

No. 38,372.—FRANCIS P. CATLIN, of Hudson, St. Croix county, Wis.—*Improvement in Window-sash Supporters.*—Patent dated May 5, 1863.—This invention consists in a tumbling weighted lever set within a recess on the side and edge of a window casing, bearing by the edge of one of its members on the edge of the sash; one face of impingement, either that on the sash or that on the tumbler, being shod with India-rubber or other elastic substance.

Claim.—First, the combination of the arm or lever K and the weight W inserted in the casing, as described, with the rubber or other elastic substance R inserted either in the sash or in the lever K.

Second, the lever K and weight W inserted in the sash with the rubber or other elastic substance attached to either the casing or arm K, substantially as and for the purpose described.

No. 38,373.—DAVID N. B. COFFIN, jr., of Woburn, Middlesex county, Mass.—*Improvement in Boots and Shoes.*—Patent dated May 5, 1863.—This improvement consists in the arrangement of a series of buttons on one part, and of eyelets or loops on the other part of the boot, so that the boot lace may be passed in its zigzag course alternately through an eyelet and over a button and fastened at each end, and afterwards may be loosed by being unbuttoned without untying and without disarrangement of the cord.

Claim.—The button-laced boot and shoe as a new article of manufacture, the distinguishing feature of which consists of the arrangement of a series of buttons and a series of holes, eyelets, loops or studs upon the different parts which are to be drawn together and secured to each other; these buttons on the one part, and holes, eyelets, loops or studs on the other, being arranged to receive a lacing, string or cord, alternating from one member of one series to one of the other, and *vice versa*, so that the unlooping of the string from one button loosens the loop upon the next; and unlooping one or more of the loops from their respective buttons, the fastening of the boot or shoe is loosened while the ends of the string remain fast, and such loops of the string may be looped on again, so refastening the boot or shoe, substantially as herein set forth.

No. 38,374.—CALVIN D. CRANE, of Fort Wayne, Allen county, Indiana.—*Improvement in Tax Calculators.*—Patent dated May 5, 1863.—The claim contains as clear a statement as can readily be made within the limits. A detailed description of the process of calculation would be beyond the scope of the present abstract.

Claim.—The permutation method of calculating applied to the calculation of taxes in the manner described in the specification, viz: first, by the printing of the taxes on the multiples of \$100 at each per cent. on a separate slip, so that the several slips may be arranged into any required series of per cents; and, second, the arranging of the taxes on the intermediate amounts between one and one hundred dollars, including the poll-tax, on a separate sheet cut with appropriate apertures, so that they may, when necessary, be added to the amounts on the slips.

No. 38,375.—C. O. CROSBY, of New Haven, Conn.—*Improvement in Machine Shirred Ruffle.*—Patent dated May 5, 1863.—The object is to form a ruffle or frill which shall be perfectly regular, more so than that which is made by the ordinary plan of a running thread upon which the stuff is gathered by hand. The object is accomplished by attaching to a sewing machine a rocking shaft, on which is a foot-piece bearing upon the stuff near the ordinary presser, and having a reciprocating motion gauged to the motion of the sewing machine, which pushes up the stuff into folds or plaits just as it comes under the weight of the presser; an additional thread is provided, which, under the guidance of a sliding rod, passes back and forth transversely on the face of the fabric and is crossed by the sewing machine stitch.

Claim.—The mechanically-shirred ruffle described, as a new article of manufacture, whether the same be double or single, or either with or without a band or binding attached thereto, substantially as herein set forth.

No. 38,376.—G. A. DABNEY, of San José, Santa Clara, California.—*Improved Washing Machine.*—Patent dated May 5, 1863.—In this machine an oscillating concave of rollers is used in connexion with a rubber, which is moved automatically with the motion of the roller-concave by means of the cords which connect the bars with the block on the rubber shaft. The depression of the bars effect the pressure of the rubbers in the extension of the spiral spring.

Claim.—The combination of the oscillating concave and rubber, when used in connexion with the oblique bars *f f*, connected with the rubber by the cords *g' g'*, and the rubber arranged as shown to admit of having its pressure graduated at the will of the operator, as herein set forth.

No. 38,377.—THEODORE D. DAY, of Brooklyn, N. Y.—*Improvement in Skirt Wire.*—Patent dated May 5, 1863.—The invention consists in covering skirt wire, or the braided covering, with a water-proof composition to prevent the oxydization of the steel wire.

Claim.—Water proof skirt wire prepared substantially as described.

No. 38,378.—DANIEL N. DENMAN, of Milburn, Essex county, N. J.—*Improvement in Liquid Filters.*—Patent issued May 5, 1863. Antedated December 25, 1862.—The water as it passes out of the penstock is made to turn a wheel, and is then discharged into the tank. A wheel revolving within the tank by power derived from the water-wheel has a web of felt around it, through which the water passes into the interior of the wheel; this web is passed over other rollers, being cleansed in its passage, and the filtered water is discharged at the ends of the wheel.

Claim.—First, a device for filtering water and other liquids composed of a wheel *F* fitted in a reservoir *A*, and provided with an endless apron or roll *G*, of felt or other fibrous material, when all are arranged in such a manner that the liquid to be filtered will pass from the reservoir through the apron or roll into the wheel, and be discharged from the ends of the latter, substantially as set forth.

Second, in combination with the reservoir *A*, wheel *F*, and apron or roll *G*, the rotary brush cylinder *I*, when used as and for the purpose set forth.

Third, the pivoted bar *J*, with roller *K* attached, in combination with the apron or roll *G*, wheel *F*, and reservoir *A*.

Fourth, the driving-wheel *D* and penstock *B*, when combined and arranged with the reservoir *A*, wheel *F* and apron or roll *G*, to operate as and for the purpose herein specified.

No. 38,379.—W. W. DINGEE and A. B. FARQUHAR, of York, Pa.—*Improvement in Threshers and Separators.*—Patent dated May 5, 1863.—The improvement consists in the suspension of the feeder's platform by a rod from the rubber, so as to act as a brake, the feeding end of the machine being over the hind axle, and the grain delivery before the front wheel. The coupling joints allow the shaft rods free longitudinal motion, and the rake head derives its motion direct from a prolongation of the line shaft.

Claim.—First, driving the rake shaft *C* from the continuation *B* of line shaft *A*.

Second, placing the delivery hopper *F* of the fan in front of the front axle of the wagon.

Third, the combination of the feeder's platform *J* with the wagon brake *L*.

Fourth, connecting the line shafting by reversible couplings in which the shaft has a free longitudinal movement.

No. 38,380.—SIMEON F. EMERSON, of Seville, Medina county, Ohio.—*Improved Clothes Wringer.*—Patent dated May 5, 1863.—This device is intended to adjust the pressure of the upper upon the lower roller, by means of the impingement of the end of the thumb-screw upon the wedge, which is interposed between the spring and the sill of the machine.

Claim.—The wedge *F* and thumb-screw *G*, when arranged and operated as and for the purpose set forth.

No. 38,381.—HENRY FISHER, of Alliance, Ohio.—*Improvement in Hand Mowing Machines.*—Patent dated May 5, 1863.—The machine is pushed before the person operating, and the reciprocating motion given to the knives by means of a hand crank and gearing with a wrist, connecting rod, and bent lever attached to the knife bar.

Claim.—Operating the sickle *B* through the medium of the bent lever *H*, connecting rod *I*, crank pulley *h*, gearing *j k*, and crank *l*, when said sickle and its operating mechanism are used in connexion with the bar *C*, rollers *E F*, and finger bar *A*, all arranged and operated as shown, for the purpose set forth.

No. 38,382.—ABNER GREENLEAF, jr., of Brooklyn, N. Y., and THOMAS C. VICE, of New Haven, Conn.—*Improvement in Kilns for Drying Grain.*—Patent dated May 5, 1863.—The kiln is heated by a series of pipes, which pass from the furnace to a rear chamber, and thence to the chimney, their ends being inserted into thimbles, whose inside diameters correspond with the inner and outer diameters of the flue pipes, so as to make an unbroken passage. A pipe from the steam boiler passes through the kiln, and is reverted back again to add to the temperature by the waste heat.

The grain is distributed on the kiln by suspended sieves, which receive it from the hopper.

Claim.—First, the arrangement of the crocks or thimbles *E* with openings *a*, the diameter of which is larger on one end than on the other, to correspond to the inside and outside diameter of the fire flues or pipes *C C'*, and to be used in combination with said pipes, substantially as and for the purpose shown and described.

Second, the arrangement of the flue chamber *D* at the rear end of the kiln *A*, in combination with the pipes *C C'* and furnace *B*, constructed and operating as and for the purpose specified.

Third, the pipe G extending from the exterior of the kiln through the latter and back to the chimney, in combination with the pipes C C', as herein shown and described.

Fourth, the arrangement of the sieve I with the hopper and the platform H, as and for the purpose herein shown and described.

No. 38,383.—W. L. GREGORY, of Amsterdam, Montgomery county, N. Y.—*Improvement in Water-Wheels*.—Patent dated May 5, 1863.—This wheel is to be driven by the force of a current, and consists of rotating disks with a number of vertical shafts with rotating buckets connected together and to a stationary gear by chains, whereby the buckets, as the wheel rotates, present a broadside to the current and are deflected so as to present an edge when returning against the current.

Claim.—The combination and arrangement of the buckets C C' C'' C''', pinions *g d*, chains D *f*, and wheel *e*, as herein shown and described.

No. 38,384.—JOSEPH L. HALL, of Cincinnati, Ohio.—*Improvement in Locks*.—Patent dated May 5, 1863.—This improvement relates to that class of locks in which a series of gated "tumblers" oppose the retraction of the bolt unless they are arranged according to a secret formula.

The invention consists in the application of a sliding dog acting in combination with the fast tumbler to prevent a clue to the formula; also in devices to facilitate a change in the combination without removing the lock; and in the disposition and arrangement of the parts to diminish friction.

The devices are fully set forth in the claims.

Claim.—First, the provision of the sliding check-piece or dog E, operated in advance of the main bolt by the same key or other device which moves the latter, in combination with one or more sets of tumblers, substantially as and for the purposes set forth.

Second, in the described combination with the fast tumbler Q, the provision of the sliding check-piece or dog F, operated in advance of the main bolt by the same bit, key or other instrument which moves the said bolt, the whole being combined and operating as and for the purposes substantially as set forth.

Third, the arrangement of a hollow withdrawable hub G, containing the operating stem N, and supporting the series of alternate loose tumblers I, and fast washers J, the whole being confined to said hub by the annular cap M, in the manner represented.

Fourth, the combination of the cap T, shiftable stem N, and fast tumblers Q, to facilitate numerous and ready changes of combination, as explained.

Fifth, the fixed washers J, gate *j*, in line with the aperture S in the hub G, to afford a fixed guide for the trier, as described.

No. 38,385.—WILLIAM HAMILTON, of Allegheny, Pa.—*Improved Machinery for Dressing Axle Boxes*.—Patent dated May 5, 1863.—The invention consists in adjusting two cutter rests upon a carriage, the cutters having an interposed adjustable gauge between them, so as to act simultaneously, and preserve a correct relative position while turning off both ends of an axle box at the same time.

Claim.—Facing both ends of an axle box at the same time, by means of two cutters placed parallel to each other at right angles to the axis of the axle box, which is caused to revolve on its axis, the cutters being so operated as to approach each other as the box is being faced, in the same relative position to each other and to the axis of the axle, substantially as described.

The combination of cutters for facing the ends of axle boxes, placed at each end thereof, and susceptible of motion toward each other while preserving a given angle of inclination to the axis of the box, with a mandrel for holding the box from its inside, capable of opening on each side of its centre for the purpose of holding the axle box with its axis at the proper angle to the cutters, and yet allowing the cutters to pass beyond the point of contact of the exterior surface of the mandrel and the interior circumference of the axle box, substantially as described.

The use of an adjustable gauge interposed between the two cutters for the purpose of stopping the operation of the machine, when the axle box has been faced down to the required length.

No. 38,386.—DENNIS HARRIS, of New York, N. Y.—*Improved Apparatus for Evaporating Saccharine and other Liquids*.—Patent dated May 5, 1863.—The semi-cylindrical pan is heated by being set in a steam bath, and by a series of pipes passing around inside of it. The circulation of the sirup is kept up by a series of revolving disks, which rotate upon a shaft whose axis is above the level of the liquid.

Claim.—The rotating disks E and blast pipes C, one or more, in combination with the pad B and steam under pressure, all arranged as and for the purpose set forth.

No. 38,387.—ROBERT G. HATFIELD, of New York, N. Y.—*Improvement in Sliding Door-Sheaves*.—Patent dated May 5, 1863.—The sheaves on the hangers, from which the door is suspended, have a tire of elastic material to enable them to move noiselessly along the track, and the height of the door is regulated by elevating screws which raise the hanger upon the axle-box of the sheaves.

Claim.—The application of adjusting apparatus to the bearings of sliding door-sheaves, for the purpose described.

Also, the construction of wheels of sliding door-sheaves with a tire or periphery composed of a muffler or sound-deadening material.

No. 38,388.—RICHARD WATSON HAWKINS, of Pittsburg, Pa.—*Improved Chimney Fastener.*—Patent dated May 5, 1863.—This invention consists of a clip to fit over the foot flange of a lamp-chimney, which is placed near the point occupied by the permanent fastener, while the chimney is placed in position, and slipped round to the opposite side to retain it there.

Claim.—The use of a chimney fastener for lamps, consisting of a slide placed in the burner frame, and having arms or other equivalent device for holding down the flange of the chimney on one side, and capable of being slid round towards the points or other device by which the chimney is held down on the opposite side, substantially as hereinbefore described.

No. 38,389.—MARK W. HOUSE, of Cleveland, Ohio.—*Improvement in Electric Baths.*—Patent dated May 5, 1863.—The object of the invention is to provide facilities for passing general or interrupted currents through the patient; also direct, transverse, and diagonal currents.

The claims define the construction and arrangement.

Claim.—First, constituting the head-electrode C, the terminus of two batteries, which may receive positive + and negative — from either battery or instrument, or both of the positives or both of the negatives, thus completing a double circuit through a single electrode, while the opposite poles of the batteries, respectively, terminate in traversing electrodes upon the sides of the tub, thus completing the circuit of either or both of the batteries, or induced current or currents, through any conducting medium placed between them.

Second, the traversing electrodes, in combination with conductors placed along the sides of the tub, as and for the purpose specified.

Third, such an arrangement of traversing electrodes that two independent sets of currents can be worked at the same time, in the same direction or in opposite directions, either longitudinally, transversely, or diagonally, through the conducting medium in the tub.

Fourth, working a primary uninterrupted current, in connexion with an induced interrupted current, either or both of which may be local or general, combinedly or single, as specified.

Fifth, the adjustable head electrode, when constructed and arranged so as to expand and contract their surface, as and for the purpose set forth.

No. 38,390.—D. B. HOWELL, of New York, N. Y.—*Improvement in Fastenings for Ornaments in Dress.*—Patent dated May 5, 1863.—The ends of the plates are provided with sharp pins, which preserve the same general curve, and the plate being deflected or bowed the pins are entered into the cloth, and the straightening of the plate sinks them in up to the edges of the plate.

Claim.—The combination of a spring plate A and pins *a a*, applied to a shoulder strap or other ornament, substantially as and for the purpose herein specified.

No. 38,391.—J. P. HOWELL, of Washingtonville, Orange county, N. Y.—*Improvement in Horse-tooth Files.*—Patent issued May 5, 1863.—Antedated February 21, 1863.—The file is set in a groove or socket in a metallic handle, being guided and kept from abraiding the lips of the animal by its raised edges.

Claim.—A horse-tooth file composed of a cast-metal stock or handle A and a file B, made separately and fitted together, substantially as herein shown and described.

No. 38,392.—F. M. HUBBARD, of Protection, Erie county, N. Y.—*Improvement in Sash Fastenings.*—Patent dated May 5, 1863.—This appliance is enclosed in a box and set into the edge of the sash. A thumb-screw operates a wheel, which drives an eccentric into impingement against the casing, or withdraws it. The position of the wheel is retained by a spring and click operating into a ratchet on said wheel.

Claim.—The driving wheel *g*, the wheel *k*, the spring *h*, the cam wheel L, and the knob *e*, the whole arranged in the manner and for the purpose substantially as set forth.

No. 38,393.—HENRY B. JAMES, of Trenton, N. J.—*Improvement in Watches.*—Patent issued May 5, 1863.—Antedated November 14, 1862.—The idle end of the balance spring is supported by means of a coil, to the end of which it is attached by a sleeve; the centre of the coil is attached to an arbor on the plate. The object is to provide an elastic support, in place of the rigid attachment by pin and stud, by which improvement the spring has a greater range and freedom of motion.

Claim.—First, providing an elastic vibrating support for the balance spring, substantially as herein specified.

Second, combining the use of the elastic vibrating support for the balance spring with the system of compensation for expansion, which constitutes the subject-matter of my letters patent of December 27, 1859, by making the said elastic support of combined laminae of two metals, substantially as herein specified.

Third, the within-described mode of connecting the balance spring and elastic vibrating support by means of the side ring *e*, applied in combination with the enlarged end of the arm *b* of the said support, as herein specified.

Fourth, securing the elastic supporting coil *B* to the plate *C* by means of the taper stud *a* applied to the coil and plate, in the manner herein specified.

No. 38,394.—JOSEPH KEECH, of Waterloo, Seneca county, N. Y.—*Improvement in Plough Clevis*.—Patent dated May 5, 1863.—The clevis consists of a toothed and slotted plate, through which the draught rod passes, and which may be rotated on a disk wheel, which itself may be varied in its set on the notched end of the beam; the effect of this four-fold toothed arrangement being to give the draught rod any required lateral or vertical adjustment in its relation to the end of the beam.

Claim.—The dial-plate *C*, provided with cogs *d d* on one side, engaging with the cogs *a a* of the beam, and with concentric radial teeth *g g* on the other side, engaging with the index plate *D*, that sustains and adjusts the draught rod, substantially as and for the purposes herein set forth.

No. 38,395.—ELISHA KENNEY, of Livermore, Androscoggin county, Maine.—*Improvement in Ox-bow Fastening*.—Patent dated May 5, 1863.—The bow is passed up through a hole in the bow cap, and then its neck is passed outwardly along a narrowed slot, and, the spring being lowered over the head of the bow, it is prevented from returning to the round orifice through which it had passed.

Claim.—The spring *B* combined with a bow cap, in the manner and for the purpose herein set forth.

No. 38,396.—THEODORE E. KING, of Ashtabula, Ohio.—*Improvement in Fences*.—Patent dated May 5, 1863.—This is an improvement in the construction of ornamental metallic fences, where the posts, base, and portions constituting the panels and gate are made separately and attached by lugs, bolts, brackets, and braces, as is explained in the claims.

Claim.—First, securing the posts to the base *G* by means of the flanges *E* and screws and nuts *F F'*, as specified.

Second, the adjustable brace *O* for supporting the panel in an upright position, arranged and operated as set forth.

Third, the brackets, Figure 6, for securing the panels to the posts, as specified.

Fourth, the brackets *M N N'* for uniting the panels and securing them to the base *G*, as described.

Fifth, the gate brackets *P Q P'* and the hinge *R S S'*, shown in Figure 7, constructed and arranged as and for the purpose set forth.

No. 38,397.—PHILIP KOCH, of New Haven, Conn.—*Improvement in Machine for Making Nuts*.—Patent issued May 5, 1863.—Antedated April 18, 1863.—The bar is pushed through a hole in the cutter, and the ascending lever cuts off a blank, which is then passed to the die, which removes the central portion, and, after being hammered and dressed, it is discharged from the machine. The motions are too intricate to be explained within moderate limits.

Claim.—First, the stationary cutter formed of the steel bar *C*, with a hole *b* made in it, in connexion with the lever *D*, or its equivalent, arranged, as shown, to cut the blank from the bar from its under side upward, substantially as set forth.

Second, the combination of the die *O* and punch *Q*, when arranged as shown, to operate as and for the purpose specified.

Third, the pin *w* attached to the spring *U*, and having the spiral spring *W* connected with it in combination with the slides *X X'*, all arranged as and for the purpose described.

Fourth, the combination of the die *C'* and movable bed *B'*, arranged for joint operation, substantially as and for the purpose specified.

Fifth, the slides *G I*, arranged as shown, when used in combination with the lever *D* and stationary cutter bar *C'*, as and for the purpose set forth.

Sixth, the slides *X X'*, arranged as shown, when used in combination with the pin *w* and box *T*, to operate as and for the purpose specified.

No. 38,398.—M. P. LARRY, of Windham, Cumberland county, Me.—*Improvement in Apparatus for Upsetting Tires*.—Patent issued May 5, 1863.—Antedated January 16, 1863.—The heated portion of the tire is placed on an arc-shaped anvil and retained by toothed clamps, a half-round and tapering false anvil being placed under the tire by which it is raised in that position; the tire is hammered, and the false anvil being gradually withdrawn, the tire is upset in that portion, and this shortened to the required extent, the tire is prevented from slipping by being leaned over laterally, which causes the teeth of the clamps to take a firm hold of it.

Claim.—A tire shrinker, constructed, combined, and arranged as shown and described.

No. 38,399.—EDWARD LUMLEY, of Elizabeth City, Union county, N. J.—*Improvement in Lathes for Turning Irregular Forms*.—Patent dated May 5, 1863.—The pattern and the

blank are each chucked in an upright frame, and the cutter frame, which has upright sides and a longitudinal motion on ways, is advanced to the blank, so that the rotating cutter will remove the outer portions of the blank to a point where its further forward progress is arrested by the pattern. The desired obliquity of the faces of the cutter knives is given by the vibration of the bed of the cutter stock and is secured by the engaging of the point with notches on a bar above the side ways of the machine.

Claim.—Vibrating the cutter H in the manner and for the purpose hereinbefore specified.

No. 38,400.—BURTON MALLORY, of New Haven, Conn.—*Improvement in Locks and Latches.*—Patent dated May 5, 1863.—The bolt is made to suit a right or a left hand door by shifting the bolt in the case so as to expose the inclined edge of the latch to the proper side of the door when closing.

Claim.—A reversible latch-bolt when the same is placed in a case independent of the lock case, and made reversible in the manner substantially as herein specified.

No. 38,401.—J. B. McMILLAN, of North Vernon, Jennings county, Ind.—*Improvement in Water Elevators.*—Patent dated May 5, 1863.—The elevator consists of a frame with a cord, bucket, and a windlass, with a ratchet wheel and a pawl and brake; the bucket has a tipping bail which, in rising, is engaged by a hook which tips the bucket and discharges the water over the side of the curb.

Claim.—The combination and arrangement of the ratchet collar F, compound pawl and brake E D, tipping hook L, tipping bail B, and return spout G, all substantially as shown and described.

No. 38,402.—JOHN D. METS, of Dubuque, Iowa.—*Apparatus for Cutting Ornaments in Paper, Leather, &c.*—Patent dated May 5, 1863.—The object of this instrument is to cut off sheets of leather, or other material, to a given pattern for ornamental book covers, and consists of knives of the desired shape attached to a frame, and with an elastic frame within the space enclosed by the knives, which will yield to the pressure and remove the cut portion when the cutters are raised.

Claim.—First, combining with the framework A and B the knife *a* and the frame C, and its knife *b*, and the yielding platforms D and E, as and for the purposes described.

Second, the removable cutter-frame C, with its yielding platform E, when arranged within an outer cutter frame, substantially as and for the purpose described.

Third, constructing the main knife-frame so that it will constitute a holder or support for one or more removable knife-frames, substantially as described.

No. 38,403.—SARGENT O. MORSE, of Medford, Mass.—*Improvement in Apparatus for Grinding File Blanks.*—Patent dated May 5, 1863.—The file blank is set in a holder with a depression to fit the blank and form a gauge to grind by; the tang being held by clamps, and the device guided by pattern lips or edges.

Claim.—The blank-holder *a*, when made with the recess, (corresponding in depth to the blank to be ground, so that its faces shall be patterns to which to reduce the surface of the blank,) and with the clamps *b* for grasping the tang.

Also, combining with the tang-holder *a*, the gauge-plate *g*, when made with the pattern lips or edges, and to be confined directly to and so as to form part of the holder or carrier, for the purpose as above set forth.

No. 38,404.—BARAK T. NICHOLS, of Newark, N. J.—*Improvement in Saddles.*—Patent dated May 5, 1863.—This improvement consists in connecting the sides of the longitudinally divided saddle by means of springs and screw bolts, so that the "spread" of the saddle may be adjusted to the back of the animal.

Claim.—The combination of the screw bolts S S with the springs D D, substantially in the manner and for the purposes described.

No. 38,405.—N. P. OTIS, of Yonkers, Westchester county, N. Y.—*Improvement in Parallel Vice.*—Patent issued May 5, 1863.—Antedated May 3, 1863.—This vice is attached to the bench by a strap which encloses a circular portion of the pillar, which is notched or grooved to give it a firm attachment to a flanged socket by means of keys. The parallelism of the jaws is secured by means of cross-bars pivoted together and attached to each of the jaws.

Claim.—First, the strap D and bar C applied to the part *a* of the shank or pillar B of the vice, and connected by the keys E when the said part *a* has any angular or irregular form which will adapt it to be firmly held, substantially as and for the purpose described.

Second, the combination of the cross-bars J J, bar C, strap D, shanks or pillars B H, swivel jaw A, permanent jaw I, screw G, and socket F, when arranged as shown to form an improved article of manufacture for the purpose specified.

No. 38,406.—EMORY PARKER, of Meriden, Conn.—*Improvement in Door Knobs.*—Patent dated May 5, 1863.—The knob has a threaded socket screwed into a threaded spindle and

secured from further rotation by a clevis or staple which fits within flanges on the shank and over the square spindle, being afterwards covered by the escutcheon.

Claim.—In combination with the screw-threaded knob and the screw-threaded angular spindle the clamp piece *b*, or its equivalent, fitting a recess in the shank, and located within the escutcheon of the knob, in the manner and for the purpose substantially as set forth.

No. 38,407.—PHILIP G. PELTZ, chief engineer United States Navy.—*Improvement in Adjustable Port-hole for Directing Ordnance.*—Patent dated May 5, 1863.—The muzzle of the piece is presented through an opening formed by the correspondence of spiral grooves in each of the two vertical rollers; as these are rotated a similar opening is presented, but in an elevated position. These rollers are fixed on the inside of the port-hole or embrasure.

Claim.—First, the use of spirally grooved rollers, substantially as herein described, rotated by a screw, lever, or other suitable means, for the purpose of presenting at any desired height an aperture to receive the muzzle of the gun.

Second, elevating or depressing guns by means of spirally grooved rollers, substantially as herein described.

Third, the reversible boxes *F F* employed in the described combination with the rollers *D D* for the purpose of changing their distance asunder.

Fourth, the casing *J* employed in the described combination with the rollers *D D* to exclude smoke and gas.

No. 38,408.—CHARLES PERLEY, of New York, N. Y.—*Improved Vertical Windlasses.*—Patent dated May 5, 1863.—This invention consists in the arrangement of the vertical shafts of the capstan and chain heavers in a triangular position, so that they may be brought nearer together and take less width transversely of the vessel, and to admit of the introduction of two speeds by which the chain heavers may be rotated with a power approximate to the varying occasion. Other points of detail are explained by the claim.

Claim.—First, arranging the shaft to which the motive power is applied and the vertical shafts carrying the chain heavers in a triangular position, so that the said heavers may be brought nearer together transversely of the vessel, as set forth.

Second, the combination of two pinions or wheels *k* and *v* with the gearing of the vertical windlass, when said wheels *k* and *v* are of different sizes and fitted in such a manner as to be connected to or disconnected from the motive power, substantially as specified, in order that the vertical windlass may receive a faster or slower movement from the motive power, as set forth.

Third, the construction of the coupling squares on the shaft *i* and the recesses in the respective wheels *k* and *v*, whereby one wheel is coupled and the other uncoupled by an endwise motion given to the said vertical shaft *i*, as specified.

Fourth, the arrangement of the pinion *w* and shaft *z* for raising and lowering the shaft *i*, as specified.

Fifth, constructing the box or base of the vertical windlass containing the gearing, of a triangular shape in its general outline, in order that the said base may occupy but little space and more firmly sustain the strain of the chain cables, as specified.

Sixth, in combination with a chain heaver, fitted in such a manner that it may be rotated from below or disconnected from the motive power, the double gearing for communicating a fast or slow motion to such chain heaver, substantially as specified.

Seventh, constructing the base box of the vertical windlass with the elevated portion *e* above the top *b*, substantially as shown, whereby double gearing can be introduced and the chain wheels are raised from the deck as little as possible, as set forth.

No. 38,409.—CHARLES PERLEY, of New York, N. Y.—*Improvement in Constructing Cannon.*—Patent dated May 5, 1863.—The cannon is made with an exterior surface tapering towards both ends from a point over the charge chamber; a reinforce band carrying the trunnions is slipped over the muzzle and back so far as to meet the end of a similar reinforce, which forms a cap on the breech, advancing to the point of junction with the former band.

Claim.—The barrel *a*, with the exterior surface tapering both ways, in combination with the ring *c* and breech cap *b*, drawn together by screw bolts, or their equivalents, as and for the purposes specified.

No. 38,410.—JOHN POOLE and THOMAS J. PATTIN, of Harmar, Washington county, Ohio.—*Improvement in Swages for Zinc Wash-boards.*—Patent dated May 5, 1863.—The zinc is corrugated between a lower bed die and an upper movable one, which is hinged so as with the bed-plate to form a jaw. The latter is operated by a cam which alternately raises it and allows it to fall; and the jaw may be retained at its elevation by means of catches which engage notches on vertical spring slats.

Claim.—The bed-plate *C*, the weighted lever drop *L*, in combination with the cam or small wheel *G* and spring catches *w w*, in the manner and for the purpose set forth.

No. 38,411.—JOHN POOLE and THOMAS J. PATTIN, of Harmar, Washington county, Ohio.—*Improvement in Clamping and Nailing Wash-boards.*—Patent dated May 5, 1863.—

This consists of a bed on which the centre and side pieces of the wash-board are placed and the reciprocating flanged sides approached by means of a lever and cam to hold them together while being nailed through the holes in the flanges.

Claim.—The sliding clamps E E, standards or posts B B, with the lever L, and cams D D, in the manner and for the purposes set forth.

No. 38,412.—WM. J. POTTER, of Chicago, Ill.—*Process for Graining and Ornamental Painting.*—Patent dated May 5, 1863.—The process is as follows: The design is engraved in relief or otherwise, and the relieved surface covered with a composition prepared as follows: one pound of macerated glue, to which is added one pint molasses, four tablespoonsful oil of tar, one ounce lampblack, one tablespoonful olive oil, and one half teaspoonful of soda; the composition digested in boiling water. This, when cooled, forms a composition for taking a cast of the engraving, and being elastic, is bent over a shaft, forming an ornamental roller. The surface to be ornamented is painted over uniformly, and the surface roller moistened with an oily composition and applied to the surface of the paint, which is allowed to dry in the parts not covered by the composition; the latter being afterwards wiped off with the undried paint beneath it.

Claim.—The employment in connexion with the aforesaid roller of some suitable solution, as described, for preventing the drying of the paint forming the figure or ornament, and thereby producing the ornamental design required by subsequently removing the paint forming such figures in the design, substantially as and for the purposes specified and described.

No. 38,413.—Suspended.

No. 38,414.—E. K. ROOT, of Hartford, Conn.—*Improvement in Shot Metallic Cartridges.*—Patent dated May 5, 1863.—The case is made with a rounded and weakened end, and a flanged base or rear, and is filled with shot, wad, powder, and fulminate, in that order.

Claim.—The combination of a charge of powder, a charge of shot, and the fulminate, with a case or shell surrounding or enclosing them, constructed substantially in the manner described and for the purpose set forth.

No. 38,415.—JOHN B. ROOT, of Brooklyn, N. Y.—*Improved Marine Propeller.*—Patent issued May 5, 1863; antedated May 3, 1863.—The hub of the propeller is of a conical shape, the point directed "aft," and the blades proceed from the base of the cone and are attached to a ring of larger diameter, being so curved and disposed as to draw the water from the circumference and discharge it behind the centre.

Claim.—The arrangement of the blades and hub of the propeller substantially as herein specified, whereby the water is drawn from the circumference toward the centre and discharged from the centre directly astern of the vessel, as herein set forth.

No. 38,416.—HENRY ROSEN, of Elkhart, Elkhart county, Ind.—*Improvement in Pumps.*—Patent dated May 5, 1863.—This pump has two pistons and two pump stocks; the plungers are attached to vibrating rolls working on a common pivot and connected by their ends to rods which are attached to a crank wrist revolved by a handle.

Claim.—Driving the buckets of the two barrels A and A' from a crank shaft I, through the medium of the rods K and K', arms D and D', and rods B and B', the whole being arranged and operating as and for the purpose herein set forth.

No. 38,417.—GEORGE C. ROUNDEY, of New York, N. Y.—*Improvement in Gas Burners.*—Patent dated May 5, 1863.—This gas burner is intended to be set as a cap above another burner, and consists of an enlarged chamber in the tube below the fish-tail orifice in which the gas is heated before it passes out of the burner.

Claim.—The combination of the cap-tube A, the expansion chamber B, and fish-tail tip C, substantially as herein described.

No. 38,418.—THOMAS F. ROWLAND, of Green Point, Kings county, N. Y.—*Improved Apparatus for Launching Vessels.*—Patent dated May 5, 1863.—This invention consists of a vibrating lever with a catch attached to the permanent ways, and engaging with a socket on the under side of the sliding ways, so as to prevent the vessel sliding off while the temporary blocking is being removed.

Claim.—The arrangement or use, in connexion with the ways A C of the rotating shaft D, extending from one set of ways to the other and provided with catches b, all operating in the manner herein shown and described.

No. 38,419.—ALFRED ROYER, of Reed's Mills, Vinton county, Ohio.—*Improved Device for Heating Ores for Smelting Furnaces.*—Patent dated May 5, 1863.—The invention consists of a grating above the head of the furnace, on which the ore is exposed to the flame as it passes into the chimney, so as to give a preliminary heating to the ore. A current of water is passed through the hollow grate bars to preserve them from being melted. The grate vibrates on a centre to discharge the ore into the furnace.

Claim.—The grate D, adapted to present the ore in an open condition to the flame of the tunnel head, and to discharge the heated ore, the said grate being preserved from destruction by a current of water traversing its interior, the whole being combined and operated substantially as set forth.

No. 38,420.—LUMAN RUNDELL, of New Baltimore, Greene county, N. Y.—*Improvement in Hay Elevating Forks.*—Patent dated May 5, 1863.—The tines of the fork are of a sickle-shape, and set into the head so that the shanks which enter the head are parallel with the handle, and gradually leaving it assume a position in advance of the head, so as to be easily inserted; the fork is swung in such a way as to be back with its load, which enables the head to bear it without strain.

Claim.—Extending the tines of a hay-fork back of the head in a sharp curve and thence to their points in a flat curve, substantially as herein shown and described, and in such relation to the handle and loop from which the fork is suspended in elevating the same, that said tines can be easily rocked into the hay, and that in elevating the load lodges in the sharp curve, where it exerts almost no lateral strain on the but ends of the tines, and consequently the liability of snapping the same at the place where they enter the head is obviated.

No. 38,421.—W. J. SAGE, of Steubenville, Ohio.—*Improvement in Horse Powers.*—Patent dated May 5, 1863.—The horse power consists of two horizontal wheels, with cogs on the upper edge of the lower wheel, and on the lower edge of the upper one, with a pinion between them. The draught animal walks on the lower wheel and draws upon the upper one, they rotating in opposite directions and actuating the pinion.

Claim.—The combination of the two toothed wheels C D, pinion E, and shaft F, arranged to operate in the manner as and for the purpose herein set forth.

No. 38,422.—ORRIN J. SAVAGE and GEORGE P. HAWLEY, of Ithaca, N. Y.—*Improvement in Lamp Burners.*—Patent dated May 5, 1863.—The outer chamber of the burner consists of two conical frustums, base to base, the lower one with large holes, and the upper one finely perforated.—The slit of the cone forms a rectangular base with a narrow top.

Claim.—First, the cone A, with its slot narrowed at the top, and gradually widening by straight and uniform lines to the bottom of the square or rectangular bottom, as represented.

Second, the combination of the cone A, the broad and flaring, finely perforated or foraminous sheet metal belt B, widening as it descends, and the base C, narrowing as it descends, with large perforations, made and used as represented and described, for the purposes set forth.

No. 38,423.—JACOB H. SHEAR, of Albany, N. Y.—*Improvement in Cooking Stoves.*—Patent dated May 5, 1863.—The object of this improvement is to equalize the heat of the stove by placing a double plate, forming a flue, behind the fire and above the oven, so that the heat of the fire shall not strike so directly into the part of the oven adjacent to the fire. These chambers are connected by openings, as described in the claim.

Claim.—The combination of the flue M and its openings *a a b b*, flue H and its openings *e e*, and its openings into flues C and E, with the back and bottom flues C D E, in the manner and for the purposes set forth in the above specification.

No. 38,424.—LEVI SHORT, of Philadelphia, Pa.—*Improved Composition for Filling Shells.*—Patent dated May 5, 1863.—Composition of the following ingredients: 40 pounds saltpetre, 7 pounds charcoal, 6 pounds asphaltum, 2 pounds antimony, 7 pounds sulphur, 2 gallons naphtha; mix, settle, and decant the supernatant liquor to saturate fibrous material as a filling for shells. The sediment is taken in its plastic state, and formed into fire balls, to be used in charging explosive projectiles.

Claim.—First, a combustible composition formed of the above-named ingredients, or their equivalents, substantially in the proportions and for the purposes herein set forth.

Second, metallic pellets or missiles filled with combustible matter, in combination and use with explosive projectiles, for the purposes and substantially as set forth.

No. 38,425.—OTIS W. STANFORD, of Mason, Warren county, Ohio, and ANDREW W. CRANE, of Lebanon, Ohio.—*Improvement in Grain Separators.*—Patent dated May 5, 1863.—The invention consists in the adaptation of the parts to receive the full and even effect of the wind by making the fan case narrower than the shoe case, so as to prevent leakage of wind on the edges of the shoe, and by placing the riddle, on which the grain or seed first falls, out of the way of the blast, so as by its vertical lateral motion to separate the seed before it is exposed to the wind.

Claim.—The vertically and laterally agitated shoe B, having the riddle D in the upper front part of it, immediately under the hopper, and mainly out of the blast, in the described combination with a case A A', having that part of it A which contains the shoe so much wider than that part of it A' which contains the fan, as to enable the interior width of the shoe at its front end to be equal to or somewhat in excess of the fan case at its front end, as and for the objects set forth.

No. 38,426.—DAVID STUART, of Philadelphia, Pa.—*Improvement in Cooking Stoves and Ranges*.—Patent dated May 5, 1863.—The improvement mainly consists in a superstructure to the ordinary flat-top stove, forming chambers in which vessels are set; also, in a falling door at front, the object being to so place the culinary vessels on and about the fire as to carry away into the chimneys the fumes, steam, and odor resulting from the various operations of cooking.

Claim.—First, the chamber F, with its door *k*, the chamber G, the fireplace J, and the oven L, when the said chambers are arranged to receive the culinary vessels, to communicate with each other and the fireplace, and in respect to each other and the oven, substantially as and for the purpose herein set forth.

Second, the culinary vessel *g*, the flange *p* on the upper edge of the same, said flange resting on a ledge *n'*, so formed in the top plate A of the stove, and so situated in respect to perforations *v* that the said perforations shall form a communication between the interior of the vessel and the chamber within which the vessel is suspended, for the purpose described.

Third, the combination of the compartment F, the perforated door *k* and the perforated valve *d*, or its equivalents, the whole being arranged for roasting, frying, broiling, and other like purposes, substantially as described.

No. 38,427.—GUISEPPE TAGLIABUE, of New York, N. Y.—*Improved Instrument for Ascertaining the Amount of Water, &c., in Barrels of Oil, &c.*—Patent dated May 5, 1863.—The instrument consists of a glass tube, with a spring valve on each end, which are connected by a rod. This is plunged slowly down into the cask through the bung-hole, the valves being kept open by pressure on the rod. When it is filled up even with that in the barrel, it is withdrawn, and the depth of water and oil may be seen in the tube, and the amount calculated by the graduated scale.

Claim.—First, the tube constructed of metal and glass.

Second, the valves at top and bottom acted on by one rod, and opening and closing together.

Third, the graduated scale on the glass sides of the tube, constructed as aforesaid.

Fourth, the whole constructed substantially as and for the purpose described.

No. 38,428.—DANIEL E. TEAL, of Norwich, Chenango county, N. Y.—*Improved Chair*.—Patent dated May 5, 1863.—The chair is arranged with a coiled spring under the seat, and resting on the frame, so as to form an elastic support for the back of the seat, when the sitter leans back in the chair.

Claim.—The combination of the seat A, the springs C C, or their equivalents, and the frame B, adapted to tilt back at the will of the sitter against the resistance of the springs, substantially as shown and described.

No. 38,429.—GEORGE W. THOMPSON and JOSEPH FOSTER, of Bordentown, N. J.—*Improved Apparatus for Generating Gas from Petroleum and other Hydro-Carbons*.—Patent issued May 5, 1863; antedated November 10, 1862.—The object of this invention is to prevent the accumulation of hard incrustation, which is difficult of removal, and interferes with the heating of the retort. The means used are explained in the claim.

Claim.—Depositing on the bottom of the retort a layer of unslacked lime, charcoal, or other equivalent material, and so arranging the feed pipe D that the oil will drop directly on to the said layer, as and for the purpose herein set forth.

No. 38,430.—JOHN TRESCH, of New York, N. Y.—*Improvement in Machinery for Moulding Pottery*.—Patent dated May 5, 1863.—The invention consists of a double-headed reciprocating carriage, each head provided with a series of cores corresponding to stationary flasks on the ends of the ways on which the carriage traverses. The clay being placed in the mould the carriage is advanced, and the cores being thrust into the flask are revolved so as to bring the clay to the shape and finish of the space between the cope and nowel. The back of the flask which forms the flat bottom of the flower-pot is provided with studs which make the hole in the bottom of the ware. A remover, carrying cores of the same shape as and disposed like those on the end of the carriage, is introduced into the pots, and the hinged sectional flask is opened so as to free them to be carried to the kiln. The operation of moulding proceeds at one end, while the removal is going on at the other.

Claim.—First, the arrangement of the double-headed reciprocating carriage C, each head being provided with a series of revolving cores *e*, in combination with two stationary flasks D D, one opposite to either head of the carriage, all constructed and operating as and for the purpose described.

Second, the arrangement of a hinged cap *j* and brace *k*, in combination with a sectional flask D, constructed and operating in the manner and for the purpose substantially as described.

Third, the employment of the remover D, constructed substantially as specified, for the purpose shown and described.

No. 38,431.—WATERS WARREN, of Three Oaks, Berrien county, Mich.—*Improvement in Beehives*.—Patent dated May 5, 1863.—The hive is constructed of polygonal form with alternate sides of wood and glass, and is surmounted by a similarly constructed honey box which may be rotated on a central pivot, so as to allow or obstruct the communication between the hive and honey box, by means of the holes in the roof and floor of the respective apartments.

Claim.—The body B and spare-honey box E, constructed of alternate sides of wood and glass and arranged in polygonal form, in combination with the cap or cover G and platform A, substantially as described.

Also, the manner of arranging or applying the spare-honey box E to the body B of the hive, to wit: by fitting the box E on a central pivot or pin *e*, when said box E is provided with holes *h* in its bottom *g*, and the top C of the body B is provided with similar holes *e'*, as and for the purpose specified.

No. 38,432.—RICHARD VOSE, of New York, N. Y.—*Improvement in Elliptic Springs*.—Patent dated May 5, 1863.—The ends of the elliptic springs are inserted in or attached to sockets, which are in turn controlled in their longitudinal displacement by tension plates which pass around and bind them together, the planes of the elliptic springs and of the tension plates being at right angles to each other.

Claim.—The combination of one or more curved, metallic bearing plates A and A', with one or more curved metallic tension plates B and B', when said plates are arranged in planes at angles to each other substantially as herein set forth.

Also, when bearing plates A and A' are arranged and combined with tension plates B and B' in the formation of an improved spring, substantially as herein set forth, confining and securing said plates by means of the metallic heads C C and D D, or their equivalents, substantially in the manner herein described.

Also, the use of intermediate, compensating springs, when combined with the bearing plates A and A', and tension plates B and B', of my improved spring, substantially in the manner and for the purpose herein set forth.

No. 38,433.—CALEB C. WALWORTH, of Boston, Mass.—*Improvement in the Arrangement of Conducting Pipes and Manifolds*.—Patent dated May 5, 1863.—On the side or sides of a conducting pipe are chambers which connect with the various pipes of the manifold; the steam is admitted by means of a valve whose seat is on the partition between the chamber and the conducting pipe, so as to communicate with all the manifold pipes opening into that chamber by one valve opening.

Claim.—The combination of the conducting pipe, valve and manifold, when arranged substantially as herein shown and described.

No. 38,434.—THEOPHILUS VAN KANNEL, of Chester, Randolph county, Ill.—*Automatic Cherry-Stoner*.—Patent dated May 5, 1863.—This machine is an improvement on Van Kannel's cherry-stoner, patented October 14, 1862, in being entirely automatic. The cherries are placed in the hopper and fed one at a time at each motion of the box; the cherry is received in a depression, and the box being raised the fork pushes the stone through a hole in the centre of the depression so that it drops out of the machine. The stoned cherry is retained on the barbed fork till a spring claw detaches it and discharges it from the machine.

Claim.—First, the curved spring-rocker E, constructed and applied to the mouth of the hopper and operating in conjunction with the slide F, or its equivalent, for feeding cherries to the machine one at a time, substantially as described.

Second, an automatic device I I', applied to a sliding box F, for discharging the stoned cherries separately from the machine, substantially as herein described.

Third, an alternately sliding and vibrating claw-plate I I', substantially as and for the purposes herein described.

Fourth, a removable plate K, applied to and forming a part of the box A, substantially as and for the purpose described.

Fifth, the combination of a conical hopper D with an automatic feeding device E and slide F, substantially as and for the purpose described.

Sixth, the perforated reciprocating basin G, for receiving and centering the cherries and retaining each cherry during the operation of the stoning fork H, in combination with a machine operating substantially as herein described.

Seventh, a machine for stoning cherries, operating substantially as and for the purposes specified.
